THE IRON AGE

THURSDAY, OCTOBER 4, 1888.

New Duplex Pump.

We illustrate on this page a duplex steam pump of new pattern, more especially intended as a means of boiler supply. It is built by Mr. John H. McGowan, of Cincinnati, Ohio, and, as the engravings will show, embraces a number of interesting features.

The steam end has valves and steam-ports and packing similar to other patterns of duplex pumps. The mechanism mov-

the lever A (see Fig. 2) has cast on its horizontal branch B the lug *b*, which works in an opening in the link D' (Fig. 1), connecting the lever A with one of the valve-rods, while the lever A' has keyed on its horizontal branch E a lug *c*, which works the link D. An examination of the engravings will make the action readily understood.

The pump end is substantial. The valve arrangement is entirely new in principle and construction. There are no

Under the superintendence of M. Abt, the rails describe one grand curve formed upon an angle of 112°, and, by an arrangement of the Abt system, the journey is made as steadily and smoothly as upon any of the straight funicular lines previously constructed. The Burgenstock, being almost perpendicular, it would have been impossible to construct a railway upon the old plan. From the shore of the Lake of Lucerne to the Burgenstock is 1330 feet, and it is 2860 feet above the level of the

Fig. 3.—End View of Levers.

Fig. 1.—Longitudinal Section.

DUPLEX BOILER FEED PUMP, BUILT BY THE JOHN H. MCGOWAN CO., CINCINNATI, OHIO.

ing the steam-valves is simple and effective. The valve-rods are supported and guided in a straight line by the standard on which the valve levers A and A' work. It will be noticed that the levers work on a common center, and that the links that move the valve-stems come in contact with the collars on the valve-stems. Any undesirable lost motion that may arise from wear can be taken up by adjustment of the collars on the valve-stems. These adjustments may be repeated until the lost motion caused by the wear of any or all parts of the valve gear equals the space or lost motion necessary in a new pump between the valve-moving links and the collars on the valve-rods to insure full strokes of the main pistons. We need perhaps scarcely explain that the left-hand valve-lever works the steam-valve of the right-hand pump, and *vice versa*. Thus

gratings to clog up, nor are there any valve-stems to be broken off. By the construction of the valve-seats and the manner in which they are arranged to fit the valve-boxes it is impossible for the seats or valves to become misplaced. By the removal of the cap supporting the air chamber all the valves and seats can be removed or replaced at will. Another valuable feature in these pumps is that the valve-box can be taken off and turned to change the position of the suction and force pipe openings. Both steam and water pistons have metallic and self-adjusting packing, by which the friction is reduced to a minimum.

An Electric Mountain Railway.—An electric mountain railway, the first of its kind, has recently been opened to the public at the Burgenstock, near Lucerne.

sea. The total length of the line is 938 meters and it commences with a gradient of 32 per cent., which is increased to 58 per cent. after the first 400 meters, and this is maintained for the rest of the journey. A single pair of rails is used throughout, with the exception of a few yards at half distance to permit the two cars to pass. Through the opposition of the Swiss Government each car is at the present time only allowed to run the half distance, and they insist upon the passengers changing, in order, as they say, to avoid collision or accident. The motive power, electricity, is generated by two dynamos, each of 25 horse-power, which are worked by a water-wheel of nominally 125 horse-power, erected upon the river Aar at its mouth at Buochs, 3 miles away. The electric current is conducted by means of insulated copper wires. The loss in transmission is estimated at 25 per cent.

Minnesota Iron Ores.—I.

BY JOHN BIRKINBINE, PHILADELPHIA, PA.

The iron mines of Minnesota will supply close to 500,000 tons of ore in 1888, the question of how much the total output falls below or exceeds 500,000 gross tons to be decided by the number of vessels which load ore at satisfactory rates at Two Harbors. The Minnesota Iron Company were fortunate in making vessel charters, by which it is understood that the lake freight on most of the ore from their Tower mines costs from \$1.10 to \$1.30 per ton, but for any excess of ore, and for the output of the Chandler mine, which has only had railroad connection since August 15, more advanced rates, possibly \$1.60 to \$1.75 per ton, must be paid. These, however, will hardly reach the extravagant figures of 1887, when heavy shipments from the Gogebic mines made late charters bring \$2.75 or even \$3 per ton for ore from Ashland, Wis., or Two Harbors, Minn. The large all-rail shipments will also have a tendency to keep lake freights lower than they were last year, and it is not improbable that the proposed increase of the lake marine may encourage vessel owners to hold the rates for water transportation within reasonable limits. The proposition to establish at Sandusky a large iron shipyard has brought before the public, through the medium of published correspondence, a more intimate knowledge of the carrying capacity of the vessels now engaged, and the cost and profit of conveying ore from the Lake Superior and Lake Michigan shipping ports to the receiving ports on Lake Erie.

TWO HARBORS.

Since last year radical changes have been made at Two Harbors, whence all the Minnesota ore is sent forward to the blast furnaces. In 1887 Two Harbors had one shipping dock with 124 pockets, the aggregate capacity of which was 13,500 gross tons. In 1888 the second dock was put into use, and there are now 206 pockets, with a total capacity of 21,000 gross tons. Marked improvements in the harbor and in the shops on shore, a rearrangement of tracks, &c., have put the Duluth and Iron Range Railroad in position to handle ore promptly, and to keep the road and rolling stock in excellent order. The whole complement of over 350 cars is kept fully employed, and frequently a train is loaded with ore at the Tower mines, runs 70 miles to Two Harbors, discharges its load into the pockets, returns empty to the mines, is loaded again, and on its way to the lake within 24 hours. A shortage of vessels, therefore, speedily produces a stagnation, and early in September all the pockets were full, and 1800 tons of ore in cars awaited a chance to be dumped. The railroad has been carrying about 20,000 tons per week, and the shipments up to the close of August reached an aggregate of 227,500 tons. As lake navigation will not be suspended until the middle of November, the probabilities are that the Minnesota Iron Company's mines will produce 450,000 tons and the Chandler mine 40,000 tons of ore, bringing the total for Minnesota close to 500,000 tons for 1888.

ALL-RAIL SHIPMENTS.

Some of the output will go by all-rail routes, and if the present rate of \$2.50 per ton from Tower to Chicago is maintained the quantity of ore thus handled will be considerable. Up to September 1, 28,500 tons of ore had been sent forward in this way. The ore at present goes via the Duluth and Iron Range Railroad to Duluth, the St. Paul and Duluth Railroad to St. Paul, and by the "Burlington" system to Chicago, a distance of nearly

700 miles. The severe winters of the Northwest offer little discouragement to "all-rail" shipments of the hard lump ores from Tower mines, and experience in shipping the softer Gogebic ores teaches that the greatest annoyance arises from the cars meeting a thaw and subsequently freezing *en route*. With continuous rail shipments and augmented lake transportation it is moderate prophecy to figure on an increase for 1888 of 25 per cent. over the output, of nearly 395,000 gross tons in 1887. Some of the Minnesota ore goes this year to Troy N. Y., Scranton, Pa., Pottstown, Pa., and to some of the Lehigh Valley blast furnaces. This suggests the thought that what the demagogue is pleased to designate as "monopolies" must in this case be satisfied with fairly moderate profits. For the mining company removes the ore from the ground, loads it into cars, one railroad company transports it 70 miles, dumps it into expensive ore docks, and thence into vessels which carry it the entire length of Lakes Superior, Huron and Erie to Buffalo; there it is shoveled into buckets, lifted from the hold, loaded into cars and carried by another railroad 800 miles across the Empire State, to meet practically at tide water foreign ores which pay a duty of 75 cents per ton.

THE IRON BELT.

The Vermillion range, from which comes all of the iron ore which has so far been shipped from Minnesota, exhibits the ore bearing rocks, extending from Tower (70 miles north of Duluth) in a northeasterly direction for 50 miles to the Canadian border, and the jasper formation in which the ore is found is traced also into the Dominion. All of the water from this range finds its way into Rainy Lake and river, and thence into Hudson's Bay. The Mesabi range of granite, which is 15 miles south of the Western end of the Vermillion range at Tower, has a more northerly trend, approaching the Vermillion range near the National boundary. It, however, extends further west than the Vermillion range, and indications of magnetic iron ores are reported for 80 miles west of and 50 miles east of a point 55 miles due north of Duluth. The range also passes into the Dominion. The ore so far explored in the Mesabi range occurs in jasper or quartzites in a ridge or hills just south of the granite range. Most of these ores are magnetites, but some hematites in jasper are also found. An interesting discovery has lately been made close to the line of the Duluth and Iron Range Railroad, 48 miles from Two Harbors, which is being thoroughly explored. Indications favor finding a deposit of soft hematite ores similar to some of the Menominee or Gogebic ores. The Mesabi range is the water-shed between the drainage of Lake Superior and that of the Mississippi River and Hudson's Bay; the prevailing opinion being that magnetites occur on the Superior slope and red hematites on the other. The exceptions seem too numerous to make the rule hold good, and some excellent cores of magnetite have been taken by diamond drills from the vicinity of the Vermillion range.

Explorations are much less active than last season, and the Chippewa Indians who fancied that they were prospective millionaires, will now sell a birch bark canoe for \$2, which they sold several times over in 1887 to various prospectors for from \$10 to \$15. The energy displayed in prospecting last year was commendable, and if "good turns" are made on some ventures, the profit will be well earned. Access to the range was, until lately, possible only by canoe route, and as a consequence the amount of luggage was reduced to a minimum. There is considerable romance in the prospect of a ride in a real birch bark canoe, but when four or five persons get

into one of these apparently frail structures bringing the gunwales into close proximity to the outside water-level by the $\frac{1}{2}$ ton of humanity and luggage it carries, a few hours will reduce the sentimental to the real. Kneeling at bow or stern and wielding a paddle continuously, is as monotonous, and possibly more wearisome than sitting in a cramped position on a "pack," in either case balancing constantly so as to prevent the canoe capsizing by the waves on the lakes, or by sudden turns in the narrow creeks. When relief comes, it is to shoulder a rude knapsack or "pack" with head strap and assist over the portage, wading through swamps, slipping from logs or scrambling over rocks and through underbrush until the canoe is lifted from the head of the Indian, and again placed in the water ready for its load. Many accustomed to the conveniences and luxuries of city life have made long canoe journeys into this wilderness, tramped through rough or swampy ground in summer, or paddled over ice and snow on snow shoes in winter, seeking a paying mine, trying with compass, pick and drill to explore nature's secrets.

Up to the present time the prospects have been numerous and the mines few, but there seems little reason to doubt that development will prove the deposits of iron ore in Minnesota to be both numerous and important; the extension of railroad facilities bringing into prominence mines whose names may become as familiar as those of some of the Marquette mines. At present, however, there appears to exist no cause which would have necessitated the transfer of the interest controlled by Mr. Charlemagne Tower, of Philadelphia, other than that he received his price, and developments must increase in number and importance before another railroad is constructed from the iron range to the lake.

One retarding factor to developments is the uncertainty of fee of some lands, owing to the failure of the homesteader to "prove up," or to the efforts on the part of speculators to question whether the land laws were fully lived up to. Several suits have been entered since the development of iron mines made the Minnesota wilderness valuable. It is the custom now (where any uncertainty exists as to the proper fulfillment of the Land Office requirements) for the homesteader to renounce his claim to the tract, which the purchaser immediately takes up with script issued to soldiers or to the Sioux half-breeds. This makes an indisputable title and protects the parties who are developing the property. There is a radical difference in the method generally followed in opening up the Vermillion range to that pursued in the Gogebic range two years ago. The properties in the former are to a large extent being explored by the owners, no leases of importance having been made except at the Chandler mine. Several syndicate operations to control large tracts of land in the Vermillion range contemplate the purchase of the land and not the lease. On the other hand, the fee of most of the territory embraced in the Gogebic range was in the hands of a few private owners, or else came into the possession by grant to the ship canal or railroad companies. As a result the realty was not sold, but a lease drawn to the advantage of the land owners was the rule in the Gogebic range, and numerous organizations called "mining companies" placed stocks before credulous investors, offering as an asset an iron-clad contract by which the mining company agreed as lessee to pay a royalty (generally 50 cents per ton) on all the ore taken from the property, but in any event, whether ore was mined or not, the lessor was to receive pay for an amount which was fixed as the minimum. The wild speculation which resulted in placing over \$100,000,000

nominally of "mining stocks" on the market at ridiculously small percentages of the "par value," and the collapse of the bubble which were to be expected, will be beneficial to the Vermillion range by encouraging investments approaching more closely the intrinsic value of property, and by insuring development less rapid but more permanent, because it will be done by the owners of property and not by lessees.

It may be paradoxical to assert the fact, but it is evident that the absence of railroad facilities along the Vermillion range is to its future advantage. The Duluth and Iron Range Railroad passes over the Messabi range, and, after meeting the Vermillion range, follows practically the strike of the ore-bearing rocks to Ely, from which it can and probably will be extended eastward. This gives convenient access to the canoe routes, and permits of getting tools and provisions into the camps of the explorers; it can also deliver the necessary machinery for preliminary

numbered as they are received. The former given an even number, the latter an odd number.

Double Saw Machine.

J. A. Fay & Co., of Cincinnati, Ohio, are bringing out a double saw machine especially adapted to the wants of cabinet-makers. The general appearance of the machine is shown in the annexed engravings. The frame is exceptionally heavy and strong, the arbors large in diameter with long bearings, each arbor and frame being adjusted independently of the other in plane gibbed ways, so arranged as to always retain the same general tension of the belt at any point to which they may be elevated. The hand wheels for use are convenient to the operator, and the table always remains at the same height. The top is of iron, carefully planed, and measures 4 feet 2 inches by 4 feet 11 inches. It is fitted upon one side with an adjustable fence,

close of the blow he charges a few shovelfuls of sand. The ferromanganese is added in a liquid state, being melted in crucibles. After the addition of the ferromanganese the metal in the converter is thoroughly rabbled, and then the steel is cast as quickly as possible. At the time of our visit a number of large rolls were being cast for Jones & Laughlins, of Pittsburgh, the Troy Steel and Iron Company, and others. The blooming mill has been idle for a considerable period and the building is soon to be used for rolling cast-steel wheels.

Twin-Screw Steamers.

Twin screws driven by triple-expansion engines have in so many cases proved more effective and economical than the side-wheelers and propellers built a few years ago that the question of converting old side-wheel steamers into twin screws is likely to arise. The experience of an

DOUBLE SAW MACHINE, BUILT BY J. A. FAY & CO., CINCINNATI, OHIO.

development at points from which it can be carried on sledges in winter to most of the properties presenting an encouraging outlook. There is no doubt but what the railroad will be extended as rapidly as circumstances demand, or, if not, that other railroads will be constructed to handle the ore which is taken out in quantity from any mines which may be opened. This will encourage judicious exploitation. On the Gogebic range the railroad followed the ore strike and preceded much of the development, thereby stimulating the operators to bring the mines into the list of shippers as soon as machinery could be set up; opening some of them in a temporary manner and obtaining cheap ore for the present, which must be more than offset by augmented cost in the future.

During a recent visit to the Philadelphia Shafting Works, G. V. Cresson, Philadelphia, we were impressed with the methodical manner in which all the details of a large business were being carried through in every department. Mr. Cresson has many "wrinkles" which save time and avoid annoyance. A very simple plan has been adopted by him to distinguish between city and country orders. All are

which can be set to different angles, and is moved in planed ways to and from the saw. The other side carries a cutting-off slide, provided with stops to govern the length to be cut, which can also be set at varying angles. 1 slots for miter or cutting-off slides are placed close to each saw. The space between the two saws is of wood, and may be thrown back, allowing free access to the saws. Grooving, rabbeting, plowing and other heads can be used in place of either saw, which may be both rip or rip and cross-cut, according to the work required to be done.

The Pittsburgh Steel Casting Company.—Under the management of William Hainsworth, who seventeen years ago began with a single crucible, the Pittsburgh Steel Casting Company, at Pittsburgh, has acquired a national reputation for crucible and Bessemer steel castings. During a recent visit we found the works engaged in a large variety of work in the crucible department, and had occasion to witness a blow in the Bessemer department. The latter is equipped with two converters casting into one pit. Mr. Hainsworth melts the best stock available, the differences in his practice from that usual in Bessemer works being that toward the

English railroad company in this direction is therefore interesting. The London and Northwestern Railway some months since placed their paddle-wheel steamer, "Duchess of Sutherland" (built in 1869), in the hands of Messrs. Laird Brothers for conversion into a twin-screw steamer, with the expectation that her efficiency for their cross-channel cattle trade would be improved, and that considerable gain in economy would result from the introduction of more modern machinery. The work has been completed, and on a recent trial trip the vessel ran 14½ knots, the engines developing 1400 horse-power. The old machinery, side wheels and boxes were removed, but the forward and after sponsons or guards and their houses on each side are retained and connected, the houses forming quarters for the ship's officers, storerooms, &c. The old side-wheel space is decked over and formed into a large additional space for cattle. The necessary alterations have been made about the stern of the vessel, and stern tubes and brackets fitted, and the arrangement of engine keelsons, bulkheads, coal-bunkers, &c., has been modified to suit the new machinery. This consists of two sets of triple expansion engines having cylinders 16½-inch, 26-inch and 41-inch diameter, with a stroke of 80 inches, and

working at 150 pounds pressure, steam being provided by two double-ended cylindrical Scotch steel boilers. The carrying power of the vessel has been increased by about 190 tons, large additional deck space for cattle gained, while the net register tonnage has been reduced by 247 tons. The speed has been considerably increased, and the consumption of fuel reduced 60 per cent

The Grading of Southern Pig Iron.

In the New York market report of *The Iron Age* of September 27th we announced that Southern pig iron manufacturers had agreed to change the grading, the new and old grades compared being as follows:

New Grade.	Old Grade.
No. 1 Foundry.....	No. 2 Foundry.
No. 2 Foundry.....	No. 2½ Foundry.
No. 3 Foundry.....	No. 1 Mill.
No. 1 Soft.....	Open Bright.
No. 2 Soft.....	Close Bright.
Silver Gray.....	Silver Gray.
Gray Forge.....	No. 2 Mill.
	Mottled.
	White.

The following companies have agreed to the change:

	Operating the furnaces.
Tennessee Coal, Iron and R. R. Co.....	4 Ensley. 2 Alice. 3 So. Pittsburg. 1 Sewanee.
Sloss Iron and Steel Co....	4 Sloss.
Nashville Iron, Steel and Charcoal Co.....	2 Nashville.
Williamson Iron Co.....	1 Williamson.
Mary Pratt Furnace Co....	1 Mary Pratt.
Roane Iron Co.....	2 Rockwood.
Citico Furnace Co.....	1 Citico.
Dayton Coal and Iron Co., Limited.....	2 Dayton.
Gadsden-Alabama, Furnace Co.....	1 Etowah.
Walker Iron and Coal Co....	1 Rising Fawn.
Chattanooga Iron Co....	1 Chattanooga.
Sheffield & Birmingham Coal, Iron and Ry. Co....	3 Cole.
Eureka Company.....	2 Eureka.
Woodward Iron Co.....	2 Woodward.
De Bardeleben Coal and Iron Co.....	2 De Bardeleben.

As bearing on this subject, we quote the following from a paper read by Kenneth Robertson, general manager of the Sloss Iron and Steel Company, Birmingham, Ala., at a meeting of the American Institute of Mining Engineers. It deals, of course, with the evil as it existed, but—

All strangers visiting this district are struck with the peculiar manner in which the pig iron is graded. There are 11 regular grades, besides which, when Gray Forge is ordered, one-half of Nos. 1 and 2 Mill are shipped. Occasionally there is another grade known as Silvery Mill, which is made so seldom that I cannot describe it, and have no sample to exhibit. Most of you have found it difficult to grade properly and uniformly under the simpler system which obtains elsewhere, and can consequently readily imagine the increased difficulty with us. Each furnace employs an expert, and even with this precaution the system is not conducive, at all times, to amicable relations between buyers and sellers. I am told that it was adopted at the time Southern irons were seeking a market.

The grades are as follows:

No. 1 Foundry (no longer recognized), a large-grained, dark-colored iron with crystallization extending well out to the edges of the pig. In my experience but little of it is made, and I am inclined to regard it more as a freak than a product. An average of three analyses shows 3.66 per cent. silicon in this grade.

No. 2 Foundry (new No. 1) is the equivalent of a No. 1 Foundry at the North. An average of 18 analyses gives 3.02 per cent. silicon.

No. 2½ Foundry (new No. 2) corresponds to No. 2 Foundry elsewhere. An average of eight analyses shows 3.02 per cent. silicon.

No. 1 Mill (new No. 3 Foundry) is also known as No. 3 Foundry, and in it are included irons which are not quite good enough for 2½ Foundry, and also those which are equal to what is known as Gray Forge in the Lehigh Valley and vicinity. The best of this iron is used for foundry purposes. An average of four analyses gives 2.87 per cent. silicon.

No. 2 Mill (new Gray Forge) is between 1 Mill and Mottled, and contains 2.44 per cent. silicon as an average.

No. 1 C. (now Silver Gray) is open-grained Silver Gray. I have but one analysis, which shows 5.25 per cent. silicon.

No. 2 C. (now abandoned) is close-grained Silver Gray. Average of three analyses, 7.09 per cent. silicon.

No. 1 Bright (now No. 1 Soft) is a foundry iron which is light in color but open-grained. It is made by every furnace in every district at times; but it is only in this section that it is separated from the foundry irons. Elsewhere it would be shipped as No. 1 Foundry. Average of three analyses, 3.69 per cent. silicon.

No. 2 Bright (now No. 2 Soft) is one grade lower; is closer grained; and the average of fourteen analyses is 3.11 per cent. silicon. Elsewhere it would be a No. 2 Foundry.

To complete the number, we have Mottled and White, which are the same here as elsewhere.

An idea has been prevalent for a long time that Southern irons are highly siliconized and weak; that the product of the furnaces is not foundry, but chiefly of the lower grades; and that the lower grades are sold with difficulty. The preceding analyses show that the foundry irons do not contain more silicon than irons of the same grade in other districts; the mill irons are higher in silicon than those of Glendon and Andover, but they are sold without difficulty. As to the product of the furnaces, I will give the percentages of each grade which one of the furnaces under my charge made during ten months' working under very disadvantageous circumstances. Other furnaces in the district have undoubtedly done much better; and these figures are not given as typical, but merely to show that we do make foundry iron, and that the greater portion of our product is not of lower grades.

The average of 27 determinations of phosphorus is 0.66 per cent.

Percentages of Old Grades Made.

No. 1 Foundry.....	0.27
No. 2 Foundry.....	26.23
No. 2½ Foundry.....	19.48
No. 1 Mill.....	33.82
No. 2 Mill.....	6.85
No. 1 C.....	0.56
No. 2 C.....	1.39
No. 1 Bright.....	6.07
No. 2 Bright.....	2.76
Mottled.....	2.38
White.....	0.19

Total 100.00

Calling the bright irons Foundry, which they are, the proportion of foundry iron made was 54.81 per cent., probably half the 1 Mill would have been classed as foundry elsewhere. These results are not considered as the *ne plus ultra* of furnace work, but will show what we are doing, and also that the impression that but little foundry iron is made here was erroneous.

The Waterbury Manufacturers and Lake Superior Copper Interests.

An impression widely exists in the metal trades that Connecticut and Massachusetts copper and brass manufacturers are largely interested in Lake Superior copper mining enterprises. In a conversation recently with one of the leading manufacturers of the Naugatuck Valley, we were given the leading historical facts which may have created the impression above alluded to. It appears that in the early history of the opening up of copper mines of the Upper Peninsula, one who had been connected with brass and copper manufacturing in Connecticut was struck by the opportunities offered in the way of the establishment of smelting works at Detroit. The matter was broached to Waterbury mills, and after some hesitation a committee of two was appointed by the latter to investigate on the spot the proposals made. The result was the building of a smelting plant below Detroit, the original capital of the concern, the Waterbury and Detroit Copper Company, being \$20,000. At practically the same time Mr. J. W. Clark and others interested in Lake Superior mining had started works at Houghton, called the Lake Superior Copper Company. Both prospered, the former concern having for its stockholders four of the Waterbury mills. A few years later the two smelting works were consolidated under the name of the Detroit and Lake Superior Copper Smelting Company, which for a good many years handled practically the entire output of mineral from the Lake Superior mines. From time to time the works were en-

larged and the capital increased, the returns being uniformly large. Of the four Naugatuck mills one failed, and its interest was disposed of to a number of parties, the remainder of the holdings being to some extent sub-divided by death and marriage.

Mr. Clark was interested largely in the Osceola Mining Company, and it was through his efforts that his associates, the three remaining brass and copper works in the smelting company, entered into an agreement with him to take the product of the Osceola Mine at a price lower by ½ cent than the market price in New York between the 15th and 25th of each month. This agreement was advantageous to both parties, since it freed the Osceola Company from participating in the sacrifices made by the Lake Superior copper companies on export sales during the existence of the pool. The income of the mills in question was considerably enhanced by the results of their investment in the smelting company, and it is this which is the only direct connection which there is now or has been between the copper and brass manufacturers of New England and the mining interests of Lake Superior.

The Cost of Blooms and Billets.

On page 696 of the "Tariff Statements" of the Finance Committee of the Senate we find the following figures of cost of converting pig into Bessemer ingots, and the latter into blooms and billets:

Cost of Bessemer Ingots

Waste of pig and new material	\$2.80
Labor.....	1.12
Fuel.....	.35
Refractories.....	.15
Molds and stools.....	.24
Maintenance and running expenses.....	.75
Total.....	\$5.41

Cost of Bessemer Blooms from Ingots.

Waste of metal.....	\$0.65
Labor.....	.63
Fuel.....	.25
Maintenance and running expenses.....	.55
Total.....	\$2.08

Cost of Blooms from Pig.

Pig to ingot.....	\$5.41
Ingot to bloom.....	2.08
Total.....	\$7.49

Cost of Bessemer Billets

Waste of metal.....	\$0.90
Labor.....	1.60
Maintenance.....	.45
General maintenance of works and running expenses.....	1.10
Fuel.....	.29
Total.....	\$4.34

Cost of Billets from Pig.

Pig to ingot.....	\$5.41
Ingot to bloom.....	2.08
Bloom to billet.....	4.34
Total.....	\$11.83

No indication is given of the source from which these figures have come, nor is there any clew to the locality. Still they are of much interest, as showing the items of labor, of fuel and of waste. They are valuable, too, as indicating what is the cost of the forms of soft steel given over the cost of pig iron.

Williamson Bros., of Philadelphia, Pa., have received an order from the International Steamship Company for a hoisting engine for their new steamship City of New York. This is doubtless the only American built engine or piece of machinery on this famous vessel. They are also building four hoisting engines for the company's dock in New York city, two of which are double drum hoisters. They have received an order from the Clyde line for four hoisting engines on the steamship Benison, to replace the English ones now on board.

Cost and Prices of Iron Beams.

STATEMENT OF F. J. SLADE, OF NEW JERSEY.*

There is probably no branch of iron manufacture that requires such heavy and expensive machinery for the output of so little product as that in question. The average output of each of the mills engaged in this manufacture in the year 1887, in which year the product was larger than in any previous year, was less than 9000 tons. This quantity is much less than the product of a steel-rail mill in a single month. This great difference is due to the fact that steel rails are rolled on orders for thousands of tons, of a single pattern and of uniform length, thus enabling every operation of the works to be systematized to the highest degree, and special machinery to be devised to reduce the cost of each item to a minimum.

In the manufacture of rolled beams, however, the orders are for quantities seldom as much as 50 tons, to be made at a given time, usually for lots of a single car-load or less. While the quantity of beams in large fire-proof buildings seems considerable, the fact is that, being erected only in large cities, the total quantity of beams required for them is, after all, small. Moreover, the orders are not given in such a way as to enable the beams to be rolled in quantity, as in the manufacture of rails, but are given out a story at a time, each containing a great variety of sizes and lengths, requiring constant changes of rolls, and, consequently, constantly interrupting the manufacture.

The variety of regular patterns is so great that a period of one or two months usually elapses from the time any one is rolled till it can be again made, and, consequently, it is necessary, in order to ship beams as required, to carry a large stock of all sizes, and to cut from this beams of such sizes as cannot be rolled promptly. The waste in this operation is very large, and, as it applies to a very large proportion of the total business, becomes an important factor in the cost. It is evident, therefore, that no two branches of manufacture could be more unlike than the manufacture of steel rails and that of rolled beams—the one the most uniform, and dealing with immense quantities, the other cut up into little lots of the most diverse character.

As already stated, the machinery required for the production of these large sections is so expensive that the capital invested in proportion to the yearly product is very great. Hence it is impossible that any profit can be realized unless the beams be sold at a price considerably above that charged for such staple articles as rails or merchant bars. It is popularly considered an axiom that competition for orders will necessarily cease when the price obtained ceases to yield a profit, and that, therefore, unrestricted competition will insure the manufacturer as large a profit as he is fairly entitled to. Every manufacturer knows that this is entirely untrue. The cost of every manufactured product is made up of two classes of expenses—namely, those which depend upon the output, such as material, labor and fuel, and those which must be met whether or not any product be made, such as taxes, rent, interest on mortgages, salaries, general expenses, &c. There will, of course, be no competition for work at prices below those which will cover the expenses of the first class, but the price must be sufficient to cover both classes of expense before any profit can be realized, and the keenest competition occurs when the ruling price is such as to somewhat more than cover the first class

without fully meeting the second, because there is then a life or death struggle to reduce the inevitable loss which stares the manufacturer in the face. Under such circumstances there is no escape from bankruptcy except in some means which will limit competition.

It has been charged that a "trust" exists among the makers to maintain an exorbitant price for this product. It is true that to prevent ruinous competition there have during the past 16 years, with a single interval, been agreements of various kinds between the makers of beams to maintain the price at a figure that would yield a fair profit. We claim that the public have no right to the products of labor at a less price than will yield a fair profit on that labor. We claim also that when prices fall below the point at which this can be secured, it is the natural right of any man to agree with his competitors to maintain prices at a fair figure. We claim, indeed, that it is the duty of the manufacturer so to protect his investment, for capital invested in plant for a profitless manufacture cannot be withdrawn, such works being entirely unsaleable, and, therefore, the manufacture must be made profitable or the capital is practically destroyed. That nothing more than this has been attempted by the makers of beams is susceptible of easy proof. During the whole period referred to the profits on the capital invested have not amounted to 10 per cent. per annum, while the public have had the full benefit of the cheapening of cost by the reduction in the cost of raw material and the improvement of processes, the prices at which beams are sold to-day being but a trifle over one-half of that prevailing in 1873.

There is no complaint from our customers of the operations of the so-called combination (there is no "trust" whatever); on the contrary, the course pursued has their support and approval. This is due to the fact that we have always made it a principle to make absolutely no discrimination between one party and another, and, therefore, every buyer is sure that he is on the most favorable basis in relation to his competitors. There has never been the slightest effort to coerce any one, either rival manufacturer (of whom there have been and are several) or purchaser, either from engaging in the manufacture, or from buying their beams of parties not under agreement, or importing them from abroad. The beams can be and are now laid down here at less than the ruling American price. Their quality, however, is so inferior that in most cases the American beams are preferred.

We hold, therefore, that there has been nothing in the conduct of the beam-makers to warrant a reduction in the duty on this article, and to do this because they have taken rational means to protect themselves from loss would be an act of warfare which Congress has no warrant for waging upon them. It is no part of its duty to destroy the reasonable profits of manufacturers, nor to take away their natural rights in order that the rest of the public may for a time profit by their ruin. It is for the interest of all that all capital invested in useful industry should be fairly profitable, and therefore where, as in the present case, no injustice can be shown, but, on the contrary, a record that has won the approval of all concerned, it would be a gross wrong for Congress to discriminate against this industry.

The Michigan Central Railroad has for some time past, in connection with its track work, been operating a portable steel rail saw which was designed and built for them by the Industrial Works, of Bay City, Mich. Much remarkable work in cutting

off the ends of battered rails has been done with this machine, but the maximum yet reached was a recent accomplishment. On September 12 Mr. J. B. Morford, superintendent of the Canadian Southern division, telegraphed the Industrial Works as follows: "We have beaten the record with our rail saw, having cut and drilled (both ends) 372 rails in 10 hours' service on Tuesday, the 11th inst."

Machinery of the Steamship City of New York.

So much interest has been centered in the new Atlantic steamer City of New York, of the Inman and International Line, and the ship herself is such a striking example of progress in marine architecture and engineering, that a general description of some of her machinery will, no doubt, prove acceptable. We therefore reprint the following from the London *Engineer*:

The steering gear is Brown's patent, made by Messrs. Brown Bros., of Rosebank Works, Edinburgh. In each of the two main engine rooms is placed one of Brown's hydraulic engines, which supplies a system of mains, traversing the ship fore and aft with water at a pressure of about 1000 pounds on the square inch. The engines are vertical, compound rotative, and pump the water into a steam accumulator: the steam at 150 pounds on the square inch driving down a piston, the thick rod of which plays the part of the ram of an ordinary dead weight accumulator. The pressure water is employed for working the hatch derricks, weighing the anchor, &c., and also for steering.

The City of New York has an enormous rudder, partially balanced, and of peculiar construction. It will be remembered that the ship is on the Admiralty auxiliary list, and in order to render her rudder safe from hostile fire it is wholly submerged. There is no rudder head to be seen from the outside; inside it terminates in the after peak below water-level. It is fitted with a tremendous crosshead or tiller which is operated by two hydraulic rams. Room for these could not be found sufficiently far aft, so they are linked to the crosshead or tiller, as it may be called, by a round steel bar 12 inches in diameter, and about 12 feet long.

The rams are about 18 inches in diameter and have tremendous power over the rudder. In order to provide against the effect of shocks caused by the impact of the waves there is a loaded relief valve on each of the hydraulic presses. The water is admitted to either press by valves which are situated near the bow of the ship. These valves are plain slides in a small box, and they are controlled by a tiller about as large as would be used in a 5-ton yacht. The tiller actuates one end of a short lever. The fulcrum end of this lever is controlled by an arm on the vertical spindle of a quadrant which lies under the deck. Two steel wire ropes, each with a breaking strength of 7 tons and stressed to about $\frac{1}{4}$ ton, run from the rudder head to the quadrant. The effect is precisely that of the bunting gear in a steam steering gear. As soon as the steersman puts the tiller he holds to port or starboard the appropriate valve just under his feet is opened. The rudder then moves and through the medium of the wire rope it closes the valve so that the rudder is held in its new position. Another movement of the tiller opens the valve. The corresponding motion of the rudder shuts it again, and so on. Thus the great ship can be steered by a boy. The practice was so novel to the men that it was difficult at first to get a straight course kept by those who had been accustomed to a wheel, and we are told that the best steersman on board was

* Argument before the Senate Finance Committee.

a quartermaster well up in yacht sailing. The engines which supply the hydraulic power are extremely ingenious. One very beautiful device is that by which they are automatically rendered non-compound for half a stroke in order that they may start with certainty after standing. They run quite freely and steady at any speed and for any position of a stroke required to keep the accumulator up. A complete electric plant has been fitted on board, the power being supplied by five engines and dynamos placed on a platform between the two main engines and above the level of the top of the cylinders. These engines and dynamos supply current not only for light but to four large horizontal fans on the hurricane deck driven direct by motors. These fans and motors are located in the tops of ventilating shafts extending down into the depths of the ship from which they draw air. This is, so far as we know, the first time that electricity has been used for ventilating purposes in a ship.

The propelling machinery consists of two of the largest sets of triple-expansion engines afloat. They are of the usual inverted vertical type. The cylinders are 45 in. + 74 in. + 113 in. x 5 ft. stroke. The boiler pressure is 150 pounds. The screws are 22 feet in diameter and 28 feet pitch. They revolve out board, and there is no opening in the dead wood between them. If they worked without slip they would make 218 revolutions to the mile, and at 80 revolutions, which may be taken as the standard speed, the ship would steam at 22 knots. With a slip of about 9 per cent, therefore the speed of the ship would be 20 knots. The engines stand side by side with a longitudinal bulkhead between them. They are in every respect duplicates. A door is provided in the bulkhead opposite the intermediate cranks and the starting platforms are opposite the doorway. The reversing gear is Brown's patent hydraulic. The engines are quite easily started, stopped, or reversed by one engineer on each platform. The engines are wholly of steel and gun metal, save the cylinders. The great "A" frames are splendid castings, each weighing 6 tons—that is, 12 tons for each cylinder. The valves are all pistons—four being fitted to the low-pressure cylinder, two to the intermediate and one to the high-pressure cylinder. The eccentric hoops are cast-steel lined with white metal, as are all the bearings throughout. The valves are disposed in the "corners," so to speak, and the valve-stems are united in pairs by crossheads. They work so smoothly and are so perfectly balanced that the valve gear, which is of the ordinary Stephenson link type, has really very little to do. The surface condensers are horizontal cylinders lying rather high up in the wings. The air pumps are worked by back levers in the usual way. There are no feed pumps on the main engine, the boilers being supplied by five vertical Worthington donkey pumps in each engine room, standing against the forward bulkhead. Two of these pumps will feed the boilers, but the others are for reserve, or for the countless pumping jobs wanted in a big ship. The engines actually employed at any time in feeding the boilers are controlled by an automatic arrangement, a float in the hotwell, rising or falling with the level of the water in the well, and opening or shutting the throttle-valve, an arrangement which is, so far as we are aware, quite new in marine work, and found to answer admirably; the donkey remaining steadily at work instead of tearing away for a few minutes emptying the hotwell, and then having to stand until the well fills again. It would be difficult if not impossible to find more admirable examples of the highest type of mechanical engineering than is supplied by the splendid main engines.

New Vertical Milling Machine.

Milling machines of various designs have, during the last few years, come into more general use than formerly. Much work that was formerly done on the planer or shaper can be done on a suitable milling machine not only better but much more rapidly. It is also a more economical machine from another point of view, as it does not require such skillful and high-priced labor to run it on a large majority of the work done as does a planer or shaping machine. It has, therefore,

hand wheel shown on the side of the machine. A small blower driven from the countershaft by a round belt is attached to the machine, and a flexible pipe is connected with it for the purpose of blowing the chips from the work so that the operator may clearly see and follow the lines marked out on it.

The machine is built in two sizes, the smaller size having a circular table 20 inches in diameter, while that of the larger measures 24 inches, the dimensions of other parts being correspondingly larger. The machine is built by the E. W. Bliss

NEW VERTICAL MILLING MACHINE, BUILT BY THE E. W. BLISS CO. BROOKLYN, N. Y.

come to be considered one of the most efficient of labor-saving machines for general machine shop use.

One of the most recently improved machines of this class we show on this page. It is a very heavy and substantial machine, built with especial reference to convenience of operation. The bed and upright portion are made in one casting and well braced. The upright portion is cored out and provided with shelves and a door, making a convenient tool closet. The table has an automatic cross feed driven by a belt having four changes of speed. Independent circular and longitudinal feeds are also supplied. The cutter spindle is provided with means of vertical and side adjustment not clearly shown in the engraving, and the head which carries the spindle is counterbalanced and is raised and lowered by a screw operated by the

Company, of Brooklyn, N. Y., who have 16 of them in operation in their own works.

Wire-Drawing Plate Blanks.—The Treasury Department has made the following decision in a letter to the Collector of Customs of New York, dated September 18: "Steel-wire drawing-plate blanks which have been forged into the sizes and shapes desired preparatory to their further manufacture and completion for use as 'drawing plates,' but which have not undergone any such further manufacture, are held to be dutiable at the rate of 2½ cents per pound, under the provision in Schedule C (T. L., 167) for 'forgings of * * * steel.'"

The City of Paris, sister ship to the City of New York, is almost ready for launching.

Government Receipts and Expenses.

The Warrant Division of the Treasury Department has published tables showing the receipts and expenditures of the Government in detail since the year 1856. The table of receipts shows that the largest sum ever collected from import duties was for the year ending June 30, 1882, the amount collected that year being \$220,410,730. The nearest approach to these figures prior to the passage of the tariff act of March 3, 1883, was in 1872, when the amount collected was \$216,370,287.

The act of 1883 went into operation on July 1st of that year. The question of reducing rates was under discussion before the Tariff commission and in Congress during the entire year, and naturally had some influence on the volume of importations. Yet the receipts for that year fell less than \$6,000,000 below those for the preceding year. The legitimate effect of the reduction of 1883 is seen in the receipts for the year ending with June 30, 1884, and show a reduction of \$9,600,000 below those for 1883, and over \$25,000,000 below those for 1882. There was a further falling off for the fiscal year 1885, when the receipts dropped to \$181,471,939, a decline of \$39,000,000 compared with 1882, and an excess of \$4,000,000 below the reduction which Judge Kelly estimated would attend the passage of the tariff act of 1883, the full force of that act seems to have been reached in 1885. Business was adjusted to the new rates of duty, and, although Mr. Morrison was putting forth an effort to secure horizontal reduction, this effort does not seem to have been seriously regarded by the commercial community, so far as the customs receipts reveal. For the fiscal year 1886 these receipts advanced to \$192,905,023, nearly \$11,500,000 over those for the preceding year. In 1887 there was a further advance of \$24,000,000 compared with 1886, and the figures for 1888 show \$1,800,000 in excess of the preceding year.

These figures exhibit striking coincidence, and suggest a variety of combinations that may be used efficiently by advocates of the respective sides of the tariff question. Thus, in 1872 the customs receipts reached a higher figure than ever before. In May of that year an act was passed reducing rates, which went into operation July 1. Following this reduction in rates, we find a falling off in custom receipts of \$28,000,000. The reduction steadily continued for the six years following the passage of the act, until they fell for the year, ending with June, 1878, to \$130,670,680, a decline of \$86,000,000, compared with the fiscal year 1872, the year preceding the reduction in duties. The year 1879 shows an increase of \$7,000,000. The following year the receipts rose to \$186,522,064; for 1880 they were over \$198,000,000; and for 1882, as previously stated, \$220,410,730, the highest point ever reached.

The act of 1883 is in like manner marked by decline and subsequent advances in receipts. The tariff reform advocates claim that the act of 1883 did not reduce the revenue. This is true, as may be seen by the Treasury figures. The protectionists claim that reduction of rates is not calculated to reduce, but to increase the revenue by increasing the volume of importations. This is also true, as may be seen by the Treasury figures for the years immediately following the reduction in 1872, when, among other reductions, \$13,000,000 per annum was stricken from tea and coffee, as well as for the years since the passage of the act of March, 1883. This is one of those cases where the same figures can be used to prove both sides.

To get the full force of these figures the appended table will prove useful. In it the receipts under the acts of 1882 and 1883 are arranged in parallel columns, starting

in each case with the receipts for the year immediately preceding the respective periods:

Act of 1872.		Act of 1883.	
1872.....	\$216,370,287	1882.....	\$220,410,730
1873.....	188,089,523	1883.....	214,706,497
1874.....	163,103,834	1884.....	195,067,490
1875.....	157,167,722	1885.....	181,471,939
1876.....	148,071,985	1886.....	192,905,023
1877.....	130,956,493	1887.....	217,286,893
1878.....	130,170,680	1888.....	219,091,173
1879.....	137,250,048		
1880.....	186,522,065		
1881.....	198,159,876		
1882.....	220,410,730		

It will be seen that in both cases the effect of legislation reducing rates of duty was to ultimately increase the aggregate revenue, and this increase is unquestionably attributable to an increase in the quantities of merchandise imported, as will be seen from an examination of the annual reports of the Bureau of Statistics.

A New Blacksmith's Hammer.

The Ready Striker Hammer Company, of Longmont, Col., are bringing out a new

The Ready Striker Hammer for Blacksmiths.

form of hammer, which is specially designed for blacksmiths' use. The engraving which we annex explains its arrangement. It can be attached to any anvil block, and, by one motion of a lever, will shift the hammer to strike from the center of the anvil to the fuller or *vice versa*. The power applied by the foot operates it easily and rapidly, striking either light or heavy at the will of the operator. The two tempered steel coil springs attached to the handle on each side of the axle impart elasticity to the hammer, enabling the operator, it is claimed, to perform more and better work than is possible with the hand striker, and with a considerable saving.

The Viceroy of Canton, in a letter to the Emperor, declares that kerosene oil is responsible for nine-tenths of all the fires in the empire, and remarks that if America "can prohibit our going there because labor is injurious to their interests, we have an equal right to prohibit the importation of kerosene when it is injurious to us."

Immigration at the ports in the United States for August numbered 35,812, against 37,308 for the corresponding month last year. Germany contributed 8427, England and Wales 6608, Ireland 4441, and Scandinavia 4000.

The Wheeling Steel Works.

The Wheeling Steel Works, at Benwood, near Wheeling, W. Va., were built in 1886 to supply three of the nail mills of the Wheeling district with slabs for nail manufacture. The general arrangement of the plant was on the lines first developed by Mr. Robert Forsyth, of the Union Steel Company, Chicago, the principal feature of which is the transfer of the casting operations into a special pit. The two converters, which usually blow 12,000 pounds of metal, are placed side by side in front of a pit, commanded by a central crane. The latter has a telescopic arrangement by which it receives the iron car, into which the iron is run from the three 8-foot cupolas, placed along the outside of the pit. In this manner the converters are entirely free from all encumbrances in the form of runners, &c. The same central crane receives the steel ladle, from which, by the same telescopic arrangement, it is pushed along a short track, which connects the converter-pit with the ingot-pit, the latter being commanded by a central crane. The plan at Wheeling provided for a possible addition of two more converters, so that the two now in are placed on one side of the center line of the building.

The iron as it comes from the cupolas carries about 1.4 per cent. of silicon, and the steel produced contains from 0.05 to 0.08 of carbon and about 0.35 per cent. of manganese, the ferromanganese being preheated. The ingots for slabs run about 4000 pounds, and those for billets 3000 pounds, the maximum output per day having been about 4500 tons, while the weekly average is 2000 tons of soft steel. The ingots are placed upon trucks, and are switched by a locomotive on the track which puts them within the range of the heating furnace cranes. The reheating is done in two pits, with three holes each for four ingots. The company have been forced to return to the use of producer gas for all purposes, except drying ladles and bottoms. Like the other manufacturing establishments of Wheeling, who were the first to give the two natural gas companies encouragement, they have found themselves promptly sacrificed to the demands of domestic consumers on the first signs of shortage. It has been a matter of frequent occurrence, especially in the winter, to have the supply curtailed, and at times entirely cut off. The Wheeling Steel Company have, therefore, for some time past, given up the use of natural gas except for the purposes named.

The reheated ingots are carried by a buggy to the blooming mill, a 36-inch MacKintosh, Hemphill & Co. mill with tables, driven by a 40 x 48 inch Southwark reversing engine having a piston speed of 1200 feet on ordinary work. The billets and slabs are sheared by a shear built by the Morgan Engineering Company, of Alliance, Ohio, which has a capacity of 120 square inches. The shear is located close to the end of the building, the slabs or billets being delivered outside of it upon cars standing on a track. They are pushed under a spray of water and switched back to a point where they are loaded on railroad cars.

Blast is furnished for the works by an E. P. Allis engine having a 36-inch steam and a 48-inch blowing cylinder and a 5-foot stroke. The engine is of special design with fly-wheel and rocker and is pronounced by John E. Fry, the general manager of the works, a particularly efficient piece of machinery.

A Swedish engineer, M. Lundberg, says a foreign exchange, has constructed a railway car, which, in a few minutes, may be adapted to five different gauges, the narrowest being 0.890 m. The invention has been patented in several foreign countries.

The New York Subways.

At the recent convention in this city of the Telephone Exchange Association, Mr. L. F. Beckwith, of the New York Subway Construction Company, gave some interesting facts on the New York subways. He said that, with the exception of the Edison, they are all built on the "drawing-in" system, being groups of ducts extending between a series of manholes. He believed experience had shown that a main conduit of separate pipes that may be crowded or curved or kept apart is best adapted to overcome the many obstacles met with in the ground. Screw-jointed, asphalted wrought-iron pipes, laid preferably in hydraulic cement concrete, give most tightness of duct against gas and water with greatest strength. The cement-pipe and creosoted wood tubes have also some valuable features. In some places they had met a steam-heating company's pipes and had great difficulties because of them, the steam constantly escaping, and, therefore, not permitting the use of materials of construction melting or softening at from 160° to 200° F. Non-metallic and metallic ducts 5 miles long have been purposely constructed, that the telephone people may have a chance to experiment as to their influence on low tension currents. The work done up to the 1st of the present month is here given:

Dorsett ducts, coal tar concrete, feet.....	235,837
Zinc tubes laid in hyd. cement concrete, feet.....	68,883
Creosoted wood tubes, feet.....	167,175
Cement pipe laid in hyd. cement concrete, feet.....	216,626
Iron pipe laid in asphaltic concrete, feet.....	131,284
Iron pipe laid in hyd. cement concrete, feet.....	1,423,722
Iron distributing pipe, feet.....	23,301
Edison iron tubes, feet.....	222,794
Grand total length of single duct, feet.....	2,489,602
Grand total length of single duct, miles.....	472
Grand total length of trench, miles.....	37
Number of manholes.....	523
Total length telephone and telegraph ducts, miles.....	376
Total length electric light ducts, miles.....	96
Length of telephone and telegraph trenches, miles.....	19½
Length of special electric light trenches, miles.....	17½

About 750,000 feet of single duct for telephone, telegraph and electric-light purposes authorized by the Board of Electrical Control remain to be built. For telegraph purposes an iron pipe from a man-hole connects underground with a building or with the foot of a pole. For telephone purposes the above method is used, and a pipe runs up the face of a building to the roof, where from a fixture the cable is divided for distribution on the block and surrounding blocks. Sometimes the pipe is carried up through an elevator or ventilating shaft. In the down-town district and along Broadway to Union Square an iron 8-inch pipe is laid in the trench above the subway, provided at intervals of about 50 feet with malleable-iron circular distributing or service boxes with screw covers 12 inches in diameter, with side outlets through which a cable can be conducted by a service-pipe into the buildings.

For electric light distribution the Edison Company have their special system laid. A cast-iron distributing conduit with six ducts and flush boxes has been authorized to be laid in Broadway from Fourteenth street to Thirty-fifth street. Up to August 27, 1888, there were 3567 miles of wire laid in the subways by the Metropolitan Telephone and Telegraph Company, and 100 wire lead-covered cable from Whitehall street to Fifty-eighth street, about 6 miles, and the longest of this size in exist-

ence under ground. The Western Union Company have about 100 miles of wire underground, and the Edison about 126. The Brush Company are putting an eight-conductor cable in the Broadway conduit from Fourteenth street to Thirty-fifth street, making 8 miles of electric arc light wire.

A Copper Producer on the Syndicate.

Joseph W. Clark and A. S. Bigelow have affixed their signatures, as president and treasurer, to the annual report of the Tamarack Mining Company. Their remarks on the position of the syndicate are interesting as reflecting the views of the producers. We quote the following passages:

It is evident that it is of almost vital importance to the entire copper producing interest of this country that the utmost harmony should exist in handling the rapidly increasing product of our mines. Our recent sale of 50,000,000 pounds to the Société Industrielle and Commerciale des Métaux, was the first of the great sales made by our mines to the French company, and, followed by the larger transaction of 100,000,000 pounds by the Montana company, with which we are intimately connected, enabled us in a good degree to promote, if not direct, these enormous operations. Transactions of such magnitude had, up to that time, never been recorded on the metal exchanges of this country or Europe. As we anticipated, they led directly to the consolidation and control of the product of all the great mines of the world. The inauguration of this most comprehensive system of mutual oversight, control of the product, and manipulation of these products, seems to us almost vital to their well being. The stimulus of present prices will necessarily lead all parties to crowd to their utmost all their energies in the line of production, and if this output is thrown upon the market without control it will surely result in disaster, while under the present ownership and management, it will not be difficult to compel an equitable distribution. With this ultimate object in view, the policy of the recent organization of the western sulphuret mines has been largely shaped.

It is hoped that these points, which must have prominence in the early future, will not be lost sight of. Very much has been said in the public prints about the falling off of consumption since the rapid advance in price last year, caused chiefly, it is alleged, by the operations of what is called the "French syndicate." We doubt if these statements and impressions are correct, for, although the statistics of the world's production and consumption of copper may be tolerably well in hand, we are well assured that great error and misconception prevails with the public in these matters. For instance: the statement that the consumption of rolled or sheet copper has been greatly checked by this advance is an error, for the best of reasons, that no such advance has been made. The price of rolled copper has, for a long time, been fixed by an association of the rolling mills, and fluctuations are rare where the statistics are fully discussed and conclusions reached in view of supply and demand. At no time has the price of sheet copper had a market price at all to be compared with ingot, when it was forced to the abnormal price of 10 cents, as it was last year. These facts hold also with other special brands of manufactured copper.

Another still more important error prevails with regard to the normal price of copper for the past ten or more years. It has been held up to the public that the unholy operations of the French syndicate have forced the normal price of copper from the low figure of 10 cents to the present price of 16½, and thereby checked the consumption to an alarming degree. When looked at from a producer's standpoint, the real facts, as proved by actual sales of one of our large mining companies, show for 15 consecutive years that sales have averaged over 15 cents.

We have pleasure in stating our growing confidence in the stability and integrity of the syndicate. We have done what we could by the way of inquiry, and we have no hesitation in saying that our mature judgment has the unqualified approval of our policy in the sale of our entire product for three years. The financial backing of this concern is enormous, and, so far as we are concerned, there would seem to be nothing wanting. The security of our credit is ample and perfect.

It is probable that the company to which reference is made in the report quoted above is the Osceola. We append

below a copy of the record of their sales and the prices realized:

Sales of Copper and Average Prices by the Osceola Mining Company, 1874 to 1887.

Years.	Sales. Pounds.	Average price. Cts. per pound.	Years.	Sales. Pounds.	Average price. Cts. per pound.
1874....	936,002	23.37	1881....	4,176,976	17.77
1875....	1,330,813	22.77	1882....	4,179,782	17.70
1876....	1,693,737	20.57	1883....	4,256,409	14.98
1877....	2,774,777	18.19	1884....	4,247,620	12.82
1878....	2,705,998	15.53	1885....	1,639,169	10.75
1879....	3,197,387	17.79	1886....	3,560,796	10.51
1880....	3,381,061	19.15	1887....	3,583,723	11.86

It is time that these sales for a period of 14 years show an average of 16.77 cents, though it is probable that the Osceola did better than the average, because it was never in the export pool. Yet the Tamarack report itself contains a refutation of the argument for present prices. The company produced 10,389,867 pounds of ingot copper in the fiscal year from 144,412 tons of rock stamped, yielding 3.6 per cent. of copper at a cost of 5.75 cents laid down in New York, sold, selling the copper at an average of 13.95 cents. The pluck of those who sunk a shaft over 2000 feet deep on the chance of finding the Calumet and Hecla conglomerate in depth undoubtedly deserves ample rewards. The company paid \$330,000 for its territory, and spent \$497,806.37 for construction and development, assuming that additional sums are necessary to carry the capital expenditures to \$1,000,000. Granting 25 per cent. per annum as an ample profit on a mining venture—a profit of \$250,000 per annum on an output of 15,000,000 pounds—which the plant is capable of handling, this profit would represent less than 1.75 cents per pound. In other words, with copper at 7.5 cents per pound, the Tamarack Company would be making 25 per cent. on an investment of \$1,000,000.

Another fact is not taken into account by those who point to averages of selling prices over a series of years to justify present prices, and that is the decline in the cost of production. We may cite the Quincy mine. In 1875 its cost was 15.79 cents a pound. In 1881 it had dropped to 10.03 cents, and in 1886 to 6.78 cents. Similar figures could be adduced for other mines. They are the results of the introduction of high explosives and rock-drills in mining, of improvements in transportation, machinery, stamping and dressing, of lowering of supplies and fuel. It is, therefore, unfair and misleading to quote averages over such a period of progress to support claims for high prices now.

Speculation in the Argentine Republic has broken out afresh, advices from Buenos Ayres to September 1 say: "The gold premium has begun to fall steadily, chiefly owing to the very large amounts of specie that arrive by every packet from England. It is calculated that 40,000,000 gold dollars will be the sum total of the influx of specie during the second half of this year, and with such an avalanche of the precious metal the premium must necessarily fall headlong. The whole market is now on the incline and the premium is expected to fall to 30 per cent. next month. These large gold remittances from Europe find their direct cause in Minister Pacheco's Free Banking Act, which has revolutionized the financial system of all the interior provinces. All the local Governments are in a hurry to avail themselves of the advantages of the act to start national banks in their respective provinces, and hence the motley array of loans of Argentine States in the London and Paris markets."

By the bursting of a reservoir across a ravine near Valparaiso many lives were lost, and property valued at \$3,000,000 was destroyed.

The Goulds Hydraulic Test Pumps.

The Goulds Mfg. Company, of Seneca Falls, N. Y., are putting on the market a number of newly designed hydraulic test pumps, of which we present engravings on this page.

Fig. 1 represents a gun-metal pump for testing boilers, tanks, pipes, &c., to 1000 pounds pressure per square inch, if necessary. As the cistern only holds about 2 gallons of water, the thing to be tested should first be filled by other means, and the tester then applied to supply the balance and work up the pressure. The weight of the pump is about 40 pounds. Fig. 2 shows the same design of pump mounted on a strong wood barrow with a cast-iron tank underneath for portable use in the many services which these pumps can perform. This combination is one of great utility.

In Fig. 3 we show a third design. This pump has a revolving top, admitting its being worked in any position, and a sectional lever, which can be changed to give greatest leverage. The suction and discharge valves (flanged and bolted to cylinder) are of a new and improved type, with brass valve seats, poppets and caps. The pump should be placed within short suction distance of water, or on a level

of cable now under ground in Brooklyn is 11,800 feet, between the Bedford and Williamsburgh offices, of 100 wires, twisted in pairs, the pairs broken up at all the splices, conductors 0.035, insulated to 0.075. The insulation of this cable is 39 megohms per mile; capacity, 26 microfarads; resistance of the construction, 47 ohms per mile. The electrical qualities of this 2 miles cable are: Insulation, 50 megohms; capacity, 52 microfarads, resistance of conductors, 94 ohms. There have been and still are many complaints of the im-

the 30 years of her existence the Great Eastern was successfully beached near New Ferry, on the Cheshire shore of the Mersey, England, on August 25.

The Canadian Northwest Territories.

By act of October 7, 1876, the territories formerly known as Rupert's Land and the Northwestern Territory, with the exception of Manitoba, were created into a government by the Canadian Parliament. The territories were divided, in 1882, into four districts—viz., Assiniboia, Saskatchewan, Alberta and Athabasca. Regina, the capital, is in the district of Assiniboia. Free grants of land of 160 acres can be obtained. It is estimated that the territories have over 150,000,000 acres of land suit-

IMPROVED HYDRAULIC TEST PUMPS, BUILT BY THE GOULDS MFG. COMPANY, SENECA FALLS, N. Y.

with it, and will be found invaluable to the boiler-maker or user for testing the condition of boilers, vessels, &c., as for cleaning out pipes, &c., &c. It will generate a cold-water pressure of 500 pounds per square inch.

The Brooklyn Subways.

Mr. W. D. Sargent, engaged in constructing the Brooklyn subways, has contributed to the proceedings of the Telephone Exchange Association a paper on the subject, which was presented at the recent New York meeting. He says the first section of the creosoted wooden conduits, which have been used four years, do not show any evidences of decay, the ducts remaining clean and dry, and the cables drawing in and out easily. Three-inch ducts he thinks the best. Of the cables laid four years ago, those covered with pure lead have been more than half eaten through. One just drawn out, and only two years buried, is badly corroded. Those with a mixture of tin show only slight corrosion. He thinks that if, in addition to the tin, cables were drawn through a bath of gas tar or asphaltum, then covered with a good stout braid, and again run through the bath, they would be practically imperishable. The greatest length

perfect working of this cable, but he is inclined to attribute the trouble to other causes rather than inefficiency on the part of the cable itself. The Dorsett conduit, of which much was expected, he says, has proved very unsatisfactory. They have 5 miles of it, with ducts 2 inches in diameter, and these, because of irregularities at the joints, will only permit of a cable 1½ inches in diameter being drawn in.

As the mileage of underground wire increases, the obstacles in the way of good service will be increased. The actual extent of the Brooklyn underground wires was on September 10:

	Miles.
Length of conduit.....	15.17
Length of duct.....	105.5
Length of cable.....	22.93
Length of conductor.....	2,053.3

Nineteen hundred and thirteen subscribers are using underground wires, the length of the latter being 1229.9 miles.

Although there are still some persons who believe—and perhaps the wish is father to the thought—that the great vessel designed by Brunel will not come to such an inglorious end, there is very little doubt that she will be broken up and her fragments sold as old iron. After having passed through so many vicissitudes for

able for cultivation and awaiting settlement. The total area of that part of the Dominion exceeds 1,250,000 square miles, but in this area of the Great Mackenzie Basin are not included any of the islands of the Arctic Archipelago. The coast line on the Arctic Ocean and Hudson's Bay, exclusive of inlets, is 5000 miles long. Over one-half of this coast line is accessible to whaling and sealing craft.

The total area of the lakes probably exceeds that of the Eastern Canadian-American chain and the navigable coast line of the larger lakes of the region is about 4000 miles. There is river navigation in the region to the extent of 2750 miles, half of which is suitable for stern-wheel steamers, which, with barges, may carry 300 tons; the other half is deep enough for light draft seagoing steamers. A total of 6500 miles of continuous lake and river navigation is broken in two places. One of these occurs on the Great Slave River, and to overcome it a 20-mile wagon road is now under construction from Fort Smith southward. The other break consists of 70 miles of the Athabasca River, above Fort McMurray. In these 70 miles rapids are unpleasantly numerous; flat boats can descend, but cannot ascend them.

The immense lacustrine area of the northern and eastern portions of the terri-

tory implies the future supply of a great part of the North American continent with food fish. Salmon are found in four of the rivers which empty into Hudson's Bay on the western shore, and in all of the rivers flowing into the Arctic Ocean, except the Mackenzie, in which the "inconnu" exists in great numbers. The presence of the capeling on the coasts of the Arctic Ocean and Hudson's Bay is supposed to imply the presence of the cod on these shores. In the great Mackenzie Basin there is believed to be a possible area fitted for the growth of potatoes of 650,000 square miles; suitable for barley, 407,000 square miles, and suitable for wheat, 316,000 square miles. The pastoral area is placed at 860,000 square miles, of which 26,000 are open prairie. Including the latter, 274,000 square miles may be considered arable. Of the total area, 400,000 square miles are useless for the pasturage of domestic animals or for cultivation. The forest area contains the liard, a balsam poplar, which attains a growth of 120 feet in height and a stump diameter of 6 feet; the white spruce, 150 feet high, with a stump diameter of 5 feet; the larch, of about the same size, and the banksian pine, which has a straight stem 100 feet high, with a stump diameter of only 2 feet.

NEW PUBLICATIONS.

POOR'S MANUAL OF RAILROADS, 1888. By Henry V. Poor. Published by H. V. & H. W. Poor, 70 Wall street, New York.

Poor's well-known manual has been again issued with all its leading features, to which has been added a directory of railway officials. We may quote the following figures from Mr. Poor's usual summary, since they convey an idea of the magnitude of railroad interests:

	Miles.
Length of track laid up to December 31, 1887.....	149,912.70
Of which were completed up to the close of the fiscal years of the respective companies.....	147,998.60
Completed since close of their fiscal years.....	1,914.10
Increase of mileage in the calendar year 1887 (9.6 p. c.).....	13,080.75
Increase of mileage in the fiscal year 1887 (9.7 p. c.).....	14,392.04
Liabilities and Assets of the Companies owning the above 147,998.60 Miles of Line.	
Liabilities.	
Capital stock.....	\$4,191,562,020
Funded debt.....	4,186,943,116
Unfunded debt.....	294,682,071
Current debt.....	223,243,998
Total liabilities.....	\$8,896,431,214
Assets.	
Cost R. R. and equipment.....	\$7,799,471,835
Real estate, stocks, bonds and other investments.....	984,975,945
Cash, bills receivable, current accounts, &c.....	415,506,735
Total assets.....	\$9,199,954,515
Excess of assets over liabilities.....	\$303,523,301
Excess of assets in various States.....	\$441,410,306
Excess of liabilities in various States.....	137,887,005
	\$303,523,301
Miles.	
Total mileage of railroads completed at close of fiscal years.....	147,998.60
Of which full statistics of operations were received from.....	136,956.49
Mileage of roads not reporting earnings, &c., consisting chiefly of new roads not yet brought into full operation.....	11,012.11
In 1887 the greater portion of the new mileage was built in the last six months of the year, and consequently had not been brought into operation until the year 1888.	
Miles operated.....	136,986.49
Passenger train mileage.....	238,755,920
Freight train mileage.....	394,191,107
Mixed train mileage.....	11,031,869
Total train mileage.....	643,978,896

Passengers carried.....	428,225,513
Passengers--Mileage.....	10,570,306,710
Tons moved.....	552,074,752
Tons one mile.....	60,061,099,996
Earnings.—Passengers.....	\$240,542,876
Freight.....	636,666,223
Other.....	54,176,055

Total.....	\$931,385,154
Operating expenses.....	600,249,478

Net earnings.....	\$331,135,676
Other receipts, including rentals received by lessor companies..	83,164,355

Total available revenue.....	\$414,300,031
------------------------------	---------------

Payments from Available Revenue:	
Interest on bonds.....	\$195,418,710
Other interest.....	6,500,200
Dividends.....	90,613,458
Rental.....	42,042,277
Miscellaneous.....	41,168,903
	\$375,233,548

Balance—Excess of available revenue over actual payments therefrom for the year..	\$39,066,483
---	--------------

One of the most valuable compilations of the present volume is that with reference to the average rates of freights per ton per mile for each year. As it would be impossible to make a fair comparison of the average rates of all the roads, two representative groups have been selected for this purpose. The Eastern group embraces the Pennsylvania, Pittsburgh and Fort Wayne, New York Central, Lake Shore, Michigan Central, Boston and Albany and Erie. The Western group embraces the Chicago and Alton, the Burlington and Quincy, the St. Paul, the Northwestern, the Rock Island and the Illinois Central. The tables of the aggregate tonnage carried 1 mile by these two groups show that in the 20 years from 1865 to 1885 the average rates of freight were reduced to about one-quarter of what they were in 1865. On the Eastern group the rate per ton per mile was reduced from 2.900 cents to 0.636 cents, with an advance to 0.718 cents in 1887 on the roads running east from Chicago. On the roads west from Chicago the rate was reduced from 3.642 cents in 1865 to 1.014 cents in 1887. During the same time there was an increase in the aggregate freight carried per ton per mile from 1,639,316,859 tons in 1865 to 13,543,351,451 in 1887 on the Eastern system, and from 513,421,459 in 1865 to 7,776,436,486 in 1887 on the Western system. The following shows the tons carried 1 mile and the rate per ton per mile on each system for each of the 23 years, ending with 1887:

Year.	—Eastern system.—		—West. system.—	
	Aggregate tons—miles.	Rate pr. tn. pr. mi.	Aggregate.	Rate per mile.
1865.....	1,649,216,859	2.900	513,421,459	3.642
1866.....	2,044,416,231	2.503	576,888,638	3.459
1867.....	2,258,216,174	2.305	768,171,050	3.175
1868.....	2,541,578,620	2.132	889,850,974	3.151
1869.....	3,150,532,219	1.880	1,054,559,835	3.026
1870.....	3,686,324,803	1.598	1,234,078,231	2.423
1871.....	4,240,131,068	1.478	1,333,068,056	2.509
1872.....	5,081,233,127	1.504	1,537,068,063	2.324
1873.....	5,762,062,724	1.476	1,719,490,690	2.188
1874.....	5,879,662,649	1.392	1,851,045,825	2.160
1875.....	5,935,242,397	1.161	1,904,937,377	1.979
1876.....	6,756,527,502	.985	1,994,712,255	1.877
1877.....	6,596,997,523	.971	2,211,021,475	1.604
1878.....	7,855,222,593	.908	2,822,885,896	1.476
1879.....	9,594,719,003	.764	3,470,822,877	1.279
1880.....	10,313,056,759	.909	4,107,610,830	1.389
1881.....	11,560,001,888	.763	4,498,641,431	1.405
1882.....	11,191,066,104	.756	5,040,239,962	1.364
1883.....	11,326,271,886	.829	5,768,109,279	1.310
1884.....	10,719,521,813	.740	6,093,282,749	1.220
1885.....	11,331,309,298	.696	6,500,185,261	1.158
1886.....	11,915,436,513	.711	6,806,148,918	1.111
1887.....	13,543,351,451	.718	7,776,436,486	1.014

The statement of gross and net earnings per mile, as affected by this steady reduction of rates, does not extend further back than 1884, but it shows at least that in the three years 1884-87 there was an increase in the net earnings per mile, notwithstanding the reduction of rates. The gross earnings per mile on all the railroads in the United States declined from \$6663 in 1884 to \$6265 in 1885, increased to

\$6570 in 1886 and \$6861 in 1887. Net earnings per mile decreased from \$2318 in 1884 to \$2185 in 1885, increased to \$2376 in 1886 and \$2444 in 1887, showing that notwithstanding the reduction in rates from 1884, the heavier tonnage more than made good any losses from that source. The increase of net earnings per mile in 1887 over 1884 was \$126, or 5.43 per cent. concurrent with a reduction of about 8 per cent. on the average rates on the Eastern roads, and about 17 per cent. on the Western roads.

The Senate Finance Committee's Tariff Bill.

[By Telegraph from our Washington Correspondent.]

The Senate Committee on Finance, having completed their substitute for the House bill to reduce taxation and simplify laws in relation to the collection of the revenue, reported it to the Senate today.

It strikes out all after the enacting clause and inserts 162 pages of new matter, beginning with tobacco, imposing a special tax of \$3 a year on manufacturers of cigars, and otherwise modifying and repealing certain internal revenue taxes.

It then takes up the import schedules, making more or less modification, observing the theory of protection throughout.

Iron ore remains at 75 cents a ton, with no deduction on account of moisture chemically or physically combined with it.

Iron in pigs, iron kentledge, spiegel-eisen, wrought and scrap iron and scrap steel, three-tenths of 1 cent, but nothing shall be deemed scrap iron or scrap steel except waste in actual use and only fit to be manufactured.

Railway bars made of iron and steel, seven-tenths of 1 cent a pound.

Hoop iron or steel duties are regulated so that when cut to lengths for baling it shall pay two-tenths of 1 per cent. per pound more than the ordinary material.

In sheets of iron it is provided that all common or black sheet iron or steel not thinner than No. 10 wire gauge shall pay duty as plate iron or steel.

Wire rods smaller than No. 6 wire gauge shall be dutiable as wire.

Steel ingots and steel in forms not enumerated shall pay from $\frac{1}{10}$ cent to $3\frac{1}{4}$ cents a pound, [remainder of sentence indistinct in telegram].

All metal produced from iron or its ores by the various modern processes of making steel is denominated steel.

The metal schedule embraces 79 paragraphs, which are more an adjustment of duties, application of modern commercial terms and unification than a change of rates.

The Senate Committee have omitted tin plate from the bill to await information from the New York Custom House. An amendment placing a protective duty of $2\frac{1}{10}$ cents a pound will be introduced pending the debate.

THE WEEK.

An inventor named W. C. Wren, residing in Brooklyn, was suffocated by gas in his bed-chamber. After experimenting for years to discover an improved process of making gas from petroleum he invented a machine, the patent for which he sold for \$100,000. Members of the family say that nearly all this sum was expended in defending his rights in the courts. He was also the inventor of a machine for making ice.

The State Railroad Commission propose the adoption of a uniform steam-coupler, in order to obviate the chief difficulty encountered in the attempt to introduce steam-heating apparatus in railway cars, and invite all interested to attend a conference at Albany, October 16.

Great excitement was caused among members of the Produce Exchange on Monday by rumors that the Gratuity Fund of the Exchange had suffered from frauds similar to those recently committed by James E. Bedell. After investigation, the Register of New York discovered fraudulent mortgages to an aggregate of \$215,000. Thereupon orders were issued for the arrest of Wm. R. Foster, Jr., for many years counsel for the Produce Exchange and for the Gratuity Fund since its inception, six years ago. The manner in which Mr. Foster enriched himself was by pretending to loan the money upon mortgages, which were in reality forged, and was precisely the same method as that described lately in connection with the Bedell forgeries. The Gratuity Fund had on hand, when the last report was made, a surplus of \$1,138,573.96, so that it will not be greatly embarrassed by its present losses. Whether Foster has spent the money or invested it for his own profit is a matter of speculation. He is a man of 45 years of age, and unmarried, and was not known to have any vices or extravagant habits.

Professor Pitt claims to have discovered a cheap process of desulphurizing the heavy oils of Ohio, which converts ordinary crude petroleum into a "water white," and burns as well as the best refined. An almost worthless substance is thus made valuable.

A combination has been made between the firm of Lombard & Ayres, of New York, and the Ocean Oil Company and the Chester Oil Company, of Philadelphia, by which the latter companies purchase the refineries of Lombard & Ayres at Bayonne, N. J. The price is said to be about \$2,000,000. Lombard & Ayres were the largest individual refiners in the country. The result will be the removal of the Tidewater Pipe Line Company's headquarters to New York City, as that company control the Chester and Ocean refineries. The Tidewater pipe lines run from the upper oil region to Bayonne, and the Ocean Company's works are at the latter place also. The Chester Company's plant will also be removed to Bayonne.

Work will soon commence on the new armory near Ninth avenue and Sixty-seventh street, for the Twenty-second Regiment. The structure will cost \$300,000.

A sensation was caused on the New York Produce Exchange by the sudden death on Saturday of Abram S. Jewell, one of its best known members and twice a highly esteemed president.

The tools used by Japanese farmers are described by one who recently witnessed the processes of rice culture. Bullocks drawing long-toothed harrows were engaged in tearing up the old stubble. Wooden plows were also at work, mere

stirring-up implements of wood, with one handle. They had a rounded nose, fortified with an iron chisel, point beveled downward. Then there was a rude plow with broad iron share for turning a shallow furrow and heavy oblong hoes for working the soil over and over. Grading scoops completed the ground utensils, but for shaping the causeways or narrow dykes between the fields the coolies used the usual hand weapons. A little Yankee ingenuity would soon introduce marvelous changes in these ancient methods.

The proposed bridge across the Hudson at Anthony's Nose is again coming into prominence, as a consequence of the now assured success of the bridge at Poughkeepsie. At the point selected for crossing, just above Peekskill, the river narrows down to a width that permits of a single span reaching from shore to shore. The plans contemplate a structure modeled after the great Brooklyn Bridge, but with a single span 3000 feet long, 195 feet above high water mark and suspended from steel towers 320 feet high and resting on natural granite foundations. Gen. Edward W. Serrell, civil engineer and president of the Highland Bridge Company, is authority for the statement that the enterprise is backed by abundant capital, and it is expected to complete the structure ready for traffic within two years. General Serrell claims important advantages for a bridge at Peekskill, as compared with the one at Poughkeepsie, in its proximity to New York city and in the shorter line of transportation offered between New England and the Pennsylvania coal and iron mining regions.

Respecting business in the Canadian province of Quebec, Mayor Latallier, of the city of Quebec, takes a rather desponding view. He is reported as saying that the province is not advancing: "The enterprise of Quebec is shown by the French-Canadian population, and through the manufacture of boots and shoes and several other industries of the St. Roch and St. John suburbs we keep our heads above water. Throughout the province, I regret to say, the present tendency is to fall back. Montreal is not advancing. She may be barely holding her own, but that is all. I refer to her commercial growth. The rural communities are losing. Emigration to the States, where the young men do well, is sapping the life-blood of the province. The Northwestern emigration is also carrying away the agriculturists, but it is to the States that the exodus is the strongest in its tide. Every young man who prospers across the border is an agent of emigration. He fills the mind of his brothers and sisters, even of his old father, with discontent with the farm and home life. Young men will go to New England and take up farms abandoned by their American owners, and will, under the existing conditions, prosper on them."

It is affirmed of the Melbourne Exhibition that it is a great success.

Peter Bergstrom, proprietor of an iron foundry at 179 Plymouth street, Brooklyn, was testing a new boiler on Friday when it exploded. His face and head were badly torn by the flying metal, and he died before he could be removed to the hospital.

Engineers appointed by the Government have selected a site for a dry dock at League Island navy yard. The dock will be 500 feet long and cost about \$500,000.

Canada has an ad valorem tariff, and complains of undervaluations of the imports from the United States. Our Bureau of Statistics makes the total of our exports to Canada in 1887 \$33,495,408 of domestic merchandise and \$2,666,944 of foreign merchandise. The Canadian authorities appraised the value of imports from the

United States during that year at \$44,802,732. This indicates an average and systematic undervaluation upon our part, as viewed by the Canadian authorities, of about 25 per cent.

An explosion of sulphuric acid, shipped as express matter from New York on board the steamer Eolus, took place off Gould Island, and the crew were nearly suffocated by the fumes before the flames could be quenched. One of the engineers afterward died.

The bank examiner of Massachusetts demanded the resignation of Cashier Chapin on account of losses on irregular securities to the amount of \$30,000, mostly to the Beattie Zinc Company.

A new way of annealing small pieces of steel is given by a writer in the *English Mechanic*. Heat the piece as slowly as possible, and when at a low red heat put it between two pieces of dry boards and screw them up tight in a vise. The steel burns its way into the boards, and, on coming together around it, they form a practically air-tight charcoal bed. When it cools off the steel is apt to be found thoroughly annealed.

Opinions obtained by the officials of the Chicago, Burlington and Quincy, the St. Paul and the Rock Island Railroads on the question of the lower rates ordered into effect by the Railroad Commissioners of Iowa, are that the United States Circuit Court, through Judge Brewer, has enjoined the lawmakers of Iowa from making rates, at least until the question has been decided by the United States Supreme Court; consequently the railroads will follow their own inclination for some time to come.

The total quantity of wool exported from Australasia from the 1st of July, 1887, to the 30th of June, 1888, as shown by the official report, was 1,283,350 bales, against 1,185,282 for the corresponding period of 1886-87; thus showing an increase of 98,068 bales. The United States received nearly 19,000 bales direct and 4000 via London. The whole number of sheep in the colonies is nearly 96,500,000, of which about one-half are in New South Wales.

The New York and New England Railroad depot in Boston, to be finished in December, will cost \$500,000 and upward.

Gedney Channel, in New York harbor, one of the most difficult to navigate, is to be lighted by six powerful electric lamps, supplied by a cable from Sandy Hook. Three of the lamps will show a red and three a white light, it being imperative that the starboard and port sides of the channel be distinctly seen, so that vessels may make their way through in safety. Gas-lit buoys have been tried, but they require constant attention. Ice is apt to tear them away, and besides they must be kept burning day and night, as there is no way to regulate the compressed gas within them.

The chairman of the Interstate Commerce Commission, Judge Cooley, gives warning, in a letter to Chairman Blanchard of the Central Traffic Association, that there is a necessity for continuing their efforts in the direction of a uniform classification of freight. Such classification, he says, must be brought about before the lapse of any great length of time, and if not agreed upon by the managers themselves is certain to be compelled by law; and he points out the advantages of voluntary rather than compulsory conformity. In a letter to Chairman Midgeley, of the Southwestern Railway Freight Association, Judge Cooley says "that a uniform classification will be required by law before any great delay, I have no doubt. The proper authority to make it is that of the railroads themselves, and they ought to

act, in view of the necessity which will soon be upon them." For more than a year past a joint conference committee of Eastern and Western roads have been at work trying to bring about the adoption of a uniform classification, but so radically different were the views of the Eastern and Western members of the committee regarding the matter that they threw up the job in disgust a short time ago. It is hardly probable that another effort to bring about a unification of the Eastern and Western classifications will be made by the railroads, and nothing but Congressional legislation can enforce the much desired reform.

The action of the State Board of Equalization in placing an additional burden of taxation on New York City evokes earnest remonstrance. The Board, at its final session on Monday last, reported that out of a total of \$200,927,687 added to the value of real estate, nearly \$119,000,000 had been transferred from other counties, and this amount is additional to the total of \$1,560,373,506, equalized real and personal, as assessed for 1887. Westchester County, likewise, has \$17,739,948 added to the assessed value of real estate. Kings County, on the other hand, is favored with a reduction of \$23,216,023. As stated by another: "These Dick Turpins of the Board of Spoliation plunder New York of the tax on \$119,000,000, while they enable their own counties to dodge taxation on \$79,000,000 which they ought to pay." The total value of assessed personal property in the State for 1887 is \$346,611,861; total value real and personal property in the State 1887, \$3,469,199,945; total equalized value real estate, \$3,122,588,084; total equalized value real and personal 1877, \$3,469,199,945.

A recent excursion of Admiral Luce in a steam yacht through the canals from New York to Norfolk is supposed to have some connection with a contemplated movement in favor of utilizing our inland lines of water communication for purposes of national defense as well as to promote the interests of commerce, and it is not unlikely that at the next session of Congress an effort will be made to insert a clause in the river and harbor appropriation bill authorizing the Secretary of War to have the canals between New York and Norfolk surveyed, with a view of determining the feasibility and cost of such an undertaking.

The Commissioners of Public Charities and Correction of New York City intend to spend \$500,000 during the present fiscal year in renovating and otherwise improving the public buildings within their charge. The bulk of this increased appropriation will be spent in constructing new and improving old buildings and in increasing the amount of necessary supplies. On buildings will be spent \$504,400, as compared with \$17,500 for 1887. The plumbing system at the Tombs prison must be entirely renewed. A new morgue will cost \$10,000, and about \$6000 will be spent in properly furnishing the new training school for males. A new pavilion for the almshouse will cost \$37,000. Many other improvements on the island institutions are contemplated.

At last the Northwestern railroads are in harmony. They have patched up their differences and agreed unanimously to advance freight rates to the basis of 60 cents first-class between Chicago and St. Paul. This action was the result of the meeting at Chairman Faithorn's office on Thursday last. The chief cause of all the discord for years past has been the milling-in-transit rates of the roads having lines west of St. Paul. These lines were enabled to monopolize the grain and flour traffic, and the roads terminating

at St. Paul could not compete with them. The Burlington and Northern refused to agree to any advance in merchandise rates until these milling-in-transit rates were abolished, or so changed as to give the non-transit lines a share of the business at reasonable rates. The St. Paul road has held out against all propositions to compromise this difference, but has now agreed to a plan that was satisfactory all around. This plan is to throw open the transit business to all the non-transit roads, and make Chairman Faithorn arbitrator to decide from time to time the amount to be paid the non-transit lines for transporting this business out of Minneapolis. This removed the whole difficulty, and left the way clear for a general advance in other rates. It will be several weeks before the importance of the railroad settlement in the Northwest can be estimated. There seems to be an effort to accomplish something beneficial, but whether the advance in rates will be permanent only time can tell. A meeting of the Freight Committee of the Central Traffic Association ratified the agreement. The advanced rates will go into effect October 15, according to the original programme.

Mayor Hewitt's yellow fever fund amounts to \$57,490.

Peru has ratified the treaty of "amity, commerce and navigation" between it and the United States.

The National Board of Steam Navigation of the United States will be held at the Fifth Avenue Hotel, this city, on October 24.

Tractive Power of Locomotives.

Mr. M. N. Forney thus explains the meaning of the term tractive power of a locomotive. It is the force with which the locomotive is urged in a horizontal direction by the pressure of the steam in the cylinders, and which therefore tends to move the locomotive and draw the load attached to it. The tractive power is due to the pressure of steam on the pistons, and therefore its amount is dependent upon the average steam pressure in the cylinders on the area of the piston and also on the distance through which the pressure is exerted—or, in other words, on the stroke of the piston. Thus, if we have a cylinder 17 inches in diameter and 2 feet stroke, and an average steam pressure of 50 pounds per square inch, then, as the area of such a piston would be 227 square inches, the average pressure on it would be $227 \times 50 = 11,350$ pounds, and, as each piston moves through 4 feet during one revolution of the wheels, the number of foot-pounds of energy exerted by it would be $11,350 \times 4 = 45,400$, and for the two cylinders of a locomotive double that amount, or 90,800 foot-pounds. If the driving-wheels are 5 feet in diameter their circumference will be 15.7 feet, and therefore the locomotive will move that distance on the rails during one revolution, if the wheels do not slip. The 90,800 foot-pounds of energy is therefore exerted through a distance of 15.7 feet, and therefore

$$\frac{90,800}{15.7} = 5783 \text{ pounds,}$$

which is the force exerted through each foot that the circumference of the wheel revolves and the locomotive moves. If the wheels were only half the diameter, or 2½ feet, then their circumference would be 7.85 feet and the tractive power would be

$$\frac{90,800}{7.85} = 11,566 \text{ pounds,}$$

or double what it was before. It will be seen, then, that the tractive force of a locomotive is dependent upon, 1, the average steam pressure in the cylinders; 2, the area of the pistons; 3, the stroke of the pistons, and 4, the diameter of the

driving-wheels. The tractive power of a locomotive is, therefore, found by multiplying together the area of the piston in square inches, the average steam pressure in pounds per square inch on the piston during the whole stroke and four times the length of the stroke of the piston, and dividing the product by the circumference of the wheels. The result will be the tractive power exerted in pounds. The adhesion must, of course, always exceed the tractive force, otherwise the wheels will slip.

Gas-Holders Without Upper Guide-Framing.

In a paper recently presented to the British Gas Institute, Mr. W. H. Y. Webber endeavored to show that by a modification of the ordinary arrangement of bottom rollers, and by the addition of tangential rollers, the upper guide-framing, or the greater portion of it might be dispensed with. The paper described a recent invention of Mr. William Gadd, of Manchester, by the application of which a gas-holder may be guided from the bottom curb; the whole of the elevated framing being dispensed with, while at the same time the stress of wind or snow pressure upon the holder has the effect of producing greater rigidity in the structure. The weight of the guide-framing of gas-holders as usually designed and constructed, if composed of wrought iron standards, slightly exceeds that of the floating vessel, and if of cast iron columns, the weight of the framing is greater still. It follows, therefore, that the cost of the guide-framing of a holder amounts to about one-half the cost of the complete structure.

If the upper guide-framing of a gas-holder could be dispensed with altogether a saving of about 50 per cent. would be effected. Mr. Gadd's invention for dispensing with the elevated guide-framing consists in placing channel or other guides within the tank at an angle, like the thread of a screw, instead of in the vertical plane as has hitherto been the invariable practice. The guide-rollers attached to the bottom curb of the holder are ranged either radially or tangentially with the sides of the vessel, and as they work in the channel or rail-guides provided for them, a helical or screw-like motion is communicated to the floating vessel as it rises and descends in the tank. The guides attached to the tank sides may be placed at any angle from 45° upward. So long as the rollers are free to move within the guides, it is impossible that the holder can tilt so as to get out of the vertical; the tendency of wind or other pressure exerted against the sides or on the roof of the vessel being to produce what may be described—imperfectly, however—as a locking action, which will sustain the holder in the upright position, however great the strain, within the resisting strength of the rollers and their carriages. While this locking or gripping action gives rigidity to the vessel, enabling it to resist the overturning force, the rollers are perfectly free to rise and descend within the guides.

In the Supreme Court of Pennsylvania, sitting in Pittsburgh on Monday, Justice Green handed down an opinion dismissing the appeal of Jacob Reese, of Pittsburgh, in the suit of the Bessemer Steel Company. The action was brought by the Bessemer Steel Company to compel Reese to transfer certain patents involving the basic process in the manufacture of steel. The lower court decreed that Mr. Reese must assign all the patents to the Bessemer Company, for which the latter was to pay Reese the sum of \$32,000. This opinion is sustained.

MANUFACTURING.

Iron and Steel.

Lucinda furnace, of the Lucinda Furnace Company, Norristown, Pa., will blow in this week on Bessemer pig.

An order has been received by the Riverside Iron Works, at Wheeling, for 15,000 feet of steel pipe for a New York concern. This pipe is to be treated by the Bower-Barff process at Pittsburgh.

The Moorhead-McCleane Company, Soho, Pittsburgh, have recently completed a new galvanizing shop in which they expect to do general job work, devoting particular attention to galvanizing iron pipe.

At the time of the construction of the Etna Iron Works plant, at Ironton, Ohio, it was designed to build twin stacks—the Alice and Sarah. The Alice was completed and has now been worked for some 14 years, its last blast lasting four years and three months—a remarkably long run considering the kinds of ore that have been used. The Blanche furnace was never lined before, but is now almost completed, and will be blown in about the third or fourth week in October, and is expected to have a monthly capacity of 3750 tons. The lining has been made by the Scioto Fire Brick Company, of Sciotoville, Ohio, and Mr. James Wileman has had charge of the masonry work. The Portsmouth Foundry and Machine Works are doing the boiler and machinery work. The new furnace will be the exact duplicate of the Alice furnace, with the exception that some slight alterations have been made in the interior proportions, which it is expected will have a very favorable effect upon its workings.

R. C. Johnstone & Co., Dalton, Ga., have received a proposition from a Connecticut malleable iron works to locate in Dalton upon certain conditions.

The Roanoke Land and Improvement Company have agreed to give a site to the Philadelphia Bridge Company, of Philadelphia, for the location of iron bridge works at Roanoke, Va.

Recently No. 2 Bessemer mill, of the Pennsylvania Steel Company, at Steelton, Pa., made an extraordinary run in its average of over 1000 tons of steel ingots each day.

The Bellaire Nail Works, at Bellaire, Ohio, are erecting a stockhouse 150 x 300 feet, to cover their entire furnace yard and switches, so that their full stock of ore and coke can be kept housed.

The Kansas City *Times* says: "The Harrison Rolling Mill have concluded their negotiations for a site, and will begin erecting their buildings in the east bottoms within 30 days. The iron mills owned by the Heims, and now located at East St. Louis, will be moved here shortly."

A furnace is to be built by J. W. Burke and others at Jacksonville, 12 miles from Anniston, Ala.

The Springfield (Ohio) *Union* says: "The test steel plant erected by the James Leffel Company for the purpose of thoroughly testing the process purchased by Mr. Bookwalter, in France, of making steel from a low grade iron, is about ready to start."

From a Pottstown paper of recent date we take the following item: "The nail plate mill of the Pottstown Iron Company is not running this week on account of repairs being made. The gas pipes, heretofore overhead, will be taken down and the gas conducted through sewers constructed of brick underground. In consequence of the mill being idle the nail

factory closed last evening for the balance of the week. The Glasgow Iron Company's Steel Works, which have been running single turn only, will commence on double turn on Monday, October 1. This will add about 100 more men to their works. The puddle mill connected with the nail plate mill of the Pottstown Iron Company will stop to give the men an opportunity to attend the fair. Some of the other mills of the company will also stop for the same purpose. The bridge works will also be closed for the same purpose, also the nail factory of Ellis & Lessig."

Mr. J. J. Morehouse, of the Chatham (N. Y.) Furnace Company, reports that the hematite charcoal furnace was blown in on the 10th ult., after having undergone extensive repairs. At the mines, also, considerable improvements have been made—a new washer having been put in, &c. The result is that the furnace is now making a larger output of car-wheel iron than ever before.

It is reported that the Pioneer Mining and Mfg. Company, of which Sam Thomas, of Pennsylvania, is president, will build a new furnace and rolling mill at Thomas, four miles from Birmingham, Ala. The total cost will be \$500,000. The furnace will have a capacity of 100 tons of pig iron per day, and the rolling mill 150 tons of merchantable iron daily, and will give employment to over 1000 men.

Since the Thomas Iron Company, at Hokendauqua, Pa., bought their hematite ore by the unit the average percentage in metallic iron has increased from about 36 per cent. to an average of 42 per cent. This, of course, has increased the output, at the same time leading to a saving in fuel and in flux.

Top Mill Furnace, Wheeling (W. Va.) Iron and Nail Company, will probably blow in on or about the 15th of October.

Charlotte Furnace, Charlotte Iron Works, Rochester, N. Y., is being prepared for a renewal of operations, which it is expected will take place before the close of the current month.

Mount Laurel Furnace, Clymer Iron Company, Temple, Pa., is having a new bosh and lining put in. It is expected that it will be ready to blow between the 15th and 20th of this month.

Florence Furnace, Henderson Iron Company, Sharpsville, Pa., which blew out on the 19th ult., is undergoing repairs, which will probably be completed by the 1st of November.

Machinery.

The Delaware and Hudson Canal Company have commenced the erection of new shops and a large roundhouse at Whitehall, N. Y.

The Whittier Machine Company, of Boston, Mass., have recently constructed for the West End Street Railway Company, Roxbury, Mass., a freight elevator for their stables.

Wm. B. Pollock & Co., proprietors of the Mahoning Boiler Works, Youngstown, Ohio, write us under recent date that they have been very busy for the past year and have considerable work ahead of them. They manufacture boilers, build blast furnaces and execute sheet-iron work of all kinds.

The Belden Machine Company, of New Haven, Conn., write us under recent date that they represent to a certain extent a continuation of the Danbury firm formerly known as the R. A. Belden Company, which is now extinct. The new company have purchased a large factory in New Haven, formerly occupied by the Mansfield Elastic Frog Company, and have filled it

with improved machinery. They will continue to manufacture the Belden improved power hammer and the Belden crank planer, and also a full line of drop forgings made from special patterns. They use drop hammers of their own build. They make and repair machinery, and in a general way turn out anything in the drop forging or special machinery line that may be wanted.

B. W. Payne & Sons, of Elmira, N. Y., have just sent us a new catalogue, which is devoted wholly to their high speed Corliss engine. This engine, as some of our readers may perhaps remember, is noteworthy for the fact that it combines a Corliss valve gear with a shaft governor and runs at a speed which is remarkably high, compared with the customary speed of ordinary forms of Corliss engines. The engine is illustrated in detail, and the engravings will no doubt be examined with a good deal of interest by engineers.

The Norton Emery Wheel Company, of Worcester, Mass., have just issued a new catalogue and price list of emery-wheels and emery-wheel machinery generally. It is profusely illustrated, showing a large number of different types of grinders, and gives all the information which prospective users of such tools may require.

The Columbus Machine Company, Columbus, Ohio, have issued a new catalogue and price list of their various manufactures. It contains illustrations and descriptions of their blowing and rolling mill engines, and stationary engines of various designs, boilers and boiler fittings, shearing machines, &c. Pulleys and gearing are also treated of, while the concluding portion of the catalogue is given up to illustrations of architectural ironwork of various kinds.

Messrs. W. D. Allen & Co., 151 Lake street will hereafter have control of the Chicago branch of the New York Belting and Packing Company. Messrs. Allen have for a number of years done an extensive business in leather belting for the account of Fayerweather & Ladew.

A brief outline of the Ball system of arc lighting is given in a small, eight-page catalogue just issued by the Ball Electric Light Company, 18 Cortlandt street, New York.

The Reliance Gauge Company, of Cleveland, Ohio, have received through the Reading Iron Works, of Philadelphia, another order from the Pencoyd Iron Works, of Pencoyd, Pa., a suburb of Philadelphia, for eight of their safety water columns. This is the fourth order from the Pencoyd Iron Works.

A Buckeye automatic engine of 125 horse-power is driving three of the Western Edison Electric Light Company's dynamos at the Chicago Exposition, furnishing power for 104 arc lamps. A similar number of lamps are run by a Russell engine, made at Massillon, Ohio.

The Schuyler Electric Company, of Middletown, Conn., makers of dynamo machines, arc and incandescent lamps and all articles relating to electric lighting and the distribution of electric power, have issued a catalogue describing their system at some length. Engravings are given of the Schuyler dynamo, together with enlarged views of their new safety armature, their automatic regulator, and single and duplex arc lamps, incandescent lamps, &c. Brief chapters are devoted to plans of lighting cities and towns, the cost of electric lighting, the power required and other matters.

Messrs. Pedrick & Ayer, 1025 Hamilton street, Philadelphia, have issued a small pamphlet devoted to the interests of their heavy universal milling machine. The

machine is briefly described, and a very flattering report on it, made by the Committee on Science and the Arts of the Franklin Institute is appended.

The Jewell Belting Company, of Hartford, Conn., have just completed a belt 5 feet wide and 140 feet long, of two thicknesses of leather. It weighs over 1600 pounds.

The contract for steam boilers for Spreckels' sugar refinery, at Philadelphia, has been given to the Babcock & Wilcox Company, of New York. There will be 7500 horse-power of boilers furnished at a cost of \$139,800.

The Fitchburg Machine Works, of Fitchburg, Mass., are sending out a neat little catalogue devoted to their line of metal working machinery. It gives illustrations and brief descriptions of their different tools, and will, no doubt, be examined with interest by machinery users.

The addition to the machine shops of the Portage Lake Foundry and Machine Works, of Messrs. Stephen E. Cleaves & Son, Houghton, Mich., which was begun in June, is now completed except the erection of the machinery. Its dimensions are 40 x 40 feet, while those of the shop as it stood before are 40 x 80 feet, making the completed building 40 x 120 feet. The principal piece in the machinery equipment of the addition is to be a lathe weighing 28 tons, the largest in the Upper Peninsula outside of the machine shop of the Calumet and Hecla Mining Company. It is being made by the Niles Tool Company, of Hamilton, Ohio, and will arrive in a short time. A stone foundation for a new foundry building, 65 x 150 feet in size, has recently been laid around the foundry building now used.

Catalogue No. 15, issued by the Dean Brothers Steam Pump Works, of Indianapolis, Ind., has just come to hand. It is a very creditable specimen of trade literature from a typographical point of view, and, besides, is not lacking in value as a source of information on the company's manufactures. Their different makes of pumps are illustrated in elevation and section, and engravings are also given of their combined pumps and boilers, together with detailed tables of sizes and prices.

Messrs. A. J. Sweeney & Son, of Wheeling, West Va., write us as follows, under date of September 25: "In our boiler yard we do very little outside of first-class marine work, upholding a much higher standard of workmanship than generally obtains in repair shops. In dull times we take in some outside repair jobs, but only to keep together our boiler yard gang. In consideration of the higher skill of our workmen we have paid an average of from 50 cents to 75 cents per day more money than others here. The object of the strike seemed to be to induce Messrs. Cox & Morrison to increase the wages of their men. The boiler-makers presented a schedule, the items of which we were complying with, with the possible exception of a claim for \$1 extra per day—that is, their wages should be increased \$1 per day when they were working on what is known as repair work—namely, boilers and the like, which is very dirty and arduous kind of labor. When the committee called on us it was headed by a man named John Ehman, who is publisher of a little sheet in this city, presumably devoted to the interest of workmen, and calculated only to make the most trouble for all outside parties. So soon as we discovered the identity of Mr. Ehman we refused to at all consider the schedule of prices; our men were entirely satisfied, and one of them was on the committee who called on us. They did not desire to strike, and were perfectly satia-

fied with the way we were paying them, but were whipped into line by the fear of being called black sheep. We refused point blank to consider the question at all as long as any one beyond our own boiler yard was connected with it. Messrs. Cox & Morrison have concluded a settlement with their men, and compromising on a scale to be paid for repair work in proportion to the value of the men employed. Our men are still out, with the exception of one who refused to remain with them, and so long as they continue to countenance such cattle as this man Ehman they will still be out, so far as we are concerned."

A new catalogue, dated 1888-89, has just been issued by Messrs. Edward P. Allis & Co., of the Reliance Works, at Milwaukee, Wis. The catalogue is specially devoted to mill and engine supplies, and will be found to contain a large amount of desirable information bearing on these branches. It is profusely illustrated, and contains extensive price lists.

The Baltimore and Ohio Railroad Company are fitting up 20 cars with the Johnson electric heat regulating device, and will equip 95 cars at once. Last fall a single car on this road was thus equipped and has given entire satisfaction ever since. The result was this order, which, we understand, is to be followed by others. Several other roads are also testing this device.

The Clayton Air Compressor Works, of Brooklyn, with a New York office at 43 Dey street, have sent us an advance copy of their catalogue No. 6. It fully illustrates and describes in detail the different styles of the Clayton air compressors, duplex and single, worked either by steam directly or by belting or gearing. In addition it gives much information and data of interest to users of compressed air, and descriptive tables and price lists of rock drills, hoisting engines, mining and boiler feed pumps, pneumatic locomotives, &c.

The Wheeler & Wilson Mfg. Company, of Bridgeport, Conn., started their works again last week. Important changes have been made, including the reduction of employees from 1100 to 800, the running now on eight hours' time, the abandonment of the former contract system, so that most of the work is now done without the intervention of contractors, and considerable reduction in the price of the few contracts that are continued. A stockholder said recently that the company used to pay 100 per cent. annual dividends, but for the past five years had not averaged over 2 per cent. There had been one time in the past when the stock was worth \$5 for \$1. He did not think it would pay over 5 per cent. in the future.

Miscellaneous.

The Holyoke Hydrant and Iron Works, of Holyoke, Mass., are sending out a small catalogue illustrating and briefly describing an improved form of fire hydrant built by them.

The Baldwin Locomotive Works are exceedingly busy completing orders on hand. The last consignment of the order for 60 locomotives for the Reading Company has just been made. The Pennsylvania Railroad have contracted for 50 eight-driver freight locomotives, and 20 have been delivered. A shipment of 10 narrow-gauge locomotives to the Mexican National Railway made last week filled 30 cars. Altogether the company turned out 70 locomotives during September, and it is expected that the record for the year will be 730 locomotives, or more than two daily.

T. William Harris, of the firm of T. William Harris & Co., 44 Broadway, New York, was elected, September 22,

secretary of the Pomeroy, Middleport and Syracuse Street Railway Company. This road will extend from Middleport to Syracuse, Ohio, a distance of over ten miles, and will be built in a most thorough manner for its large freight and passenger business.

The William Cramp & Sons Ship and Engine Building Company, of Philadelphia, on Saturday launched William P. Clyde & Co.'s new steel steamer Iroquois. The Iroquois is 300 feet long, 46 feet beam and 29 feet deep, with a measurement of about 3000 tons. She is the first large steel steamship built in this country for the merchant service, and is fitted with steam steering gear and lighted by electricity. She is to have triple-expansion engines, and to be fitted up with first-class accommodations for 200 passengers. She is to be used in the coastwise service from New York, beginning about November 1.

The Atlantic Cotton Mills, of Lawrence, Mass., are obliged to use a few electric lights each day, and purchased a year ago a 45-arc light plant (Waterhouse system), and have turned on and off lights at will, the Waterhouse regulator giving satisfaction and maintaining a steady current under partial or full load. The plant has been increased 77 lights, the order being given to the Waterhouse Electric and Mfg. Company, of Hartford, Conn.

Prime Movers.

Sir Frederick Bramwell, in his recent presidential address before the British Association for the Advancement of Science, remarked:

There are prime movers and prime movers—those of small dimensions, and employed for purposes where animal power or human power might be substituted, and those which attain ends that by no conceivable possibility could be attained at all by the exertion of muscular power. Compare a galley, a vessel propelled by oars, with the modern Atlantic liner; and first let us assume that prime movers are non-existent and that this vessel is to be propelled galley fashion. Take her length as some 600 feet, and assume that place be found for as many as 400 oars on each side, each oar worked by three men, or 2400 men, and allow that six men under these conditions could develop work equal to 1 horse-power, we should have 400 horse-power. Double the number of men, and we should have 800 horse-power, with 4800 men at work, and at least the same number in reserve, if the journey is to be carried on continuously. Contrast the puny result thus obtained with the 19,500 horse-power given forth by a large prime mover of the present day, such a power requiring, on the above mode of calculation, 117,000 men at work and 117,000 in reserve, and these to be carried in a vessel less than 600 feet in length. Even if it were possible to carry this number of men in such a vessel, by no conceivable means could their power be utilized so as to impart to it a speed of 20 knots an hour. This illustrates how a prime mover may not only be a mere substitute for muscular work, but may afford the means of attaining an end that could not by any possibility be attained by muscular exertion, no matter what money was expended or what galley-slave suffering was inflicted. Take again the case of a railway locomotive. From 400 to 600 horse-power developed in an implement which, even including its tender, does not occupy an area of more than 50 square yards, and that draws us at 60 miles an hour. Here again the prime mover succeeds in doing that which no expenditure of money or of life could enable us to obtain from muscular effort.

The Iron Age

Profits on Silver Coinage and the Surplus.

There seems to be a good deal of uncertainty as to the amount of the surplus in the United States Treasury. Some say there is practically none at all. Some say there is more than \$100,000,000. Some say there would be none if the imperatively necessary expenditures for National objects and for the payment of the actual obligations of the Government were provided for. Some say that if there is a surplus, it should be spent in buying bonds of the Government not yet due. And, of course, there are many schemes good, bad and indifferent, for disposing of the surplus, if there be one.

Strangely enough, no one seems to realize where a part of the surplus has actually come from. It is apparently accepted by all parties that this money has been taken "from the pockets of the people" through the medium of an excessive collection of revenue. Why has not some keen economist recognized the fact that \$40,000,000 nominally in the Treasury has never been in the pockets of the people at all, but is simply the profits of the Government, derived from the simple process of buying silver bullion at the market rate, and coining it into dollars at the rate of \$1.29 per ounce? The last report of the Director of the Mint shows that the "seignorage" on silver coinage during the fiscal year ending June 30, 1887, was nearly \$8,000,000, and that the total net profits of this business during the nine years of its continuance, after deducting cost of coinage, losses of metal, and money paid by the Government in shipping silver dollars free to all parts of the country, in order to facilitate their circulation, amount to \$38,601,277. Estimating the results of the three months which have since elapsed, it is safe to say that these "profits" now amount to \$40,000,000. We are therefore justified in saying:

1. If the United States had made the same purchases of bullion, at the same prices, as has been actually the case, but had coined dollars of full value, so as to make no "fiat" profit on the business, the silver producers would not have been affected; there would have been no difference in the course of trade, but there would now be a surplus of only \$80,000,000, instead of the \$120,000,000, which the Treasury officials claim it to be.

2. If the United States had coined the same number of dollars as it has done, but had made them of full value, the silver producers would have had the benefit of \$40,000,000 additional purchases of bullion; the price of silver would have been to that extent supported and there would now be so much less surplus.

3. If the United States should desire to enter into an international agreement for the remonetization of silver throughout

the civilized world, it would be obliged, as clearly appears from the report of Mr. Edward Atkinson on that subject, to recall and recoin its silver-dollar coinage. This would involve two losses: first, the loss of the fictitious value attached to the coins over and above what the metal actually cost the Government; secondly, the loss due to the continued fall in the market price of silver. The two, together with the expense of recoinage, would cost the Government nearer \$100,000,000 than \$40,000,000, and practically the surplus would disappear.

In other words, to the extent of \$40,000,000, the so-called surplus is no more real than if the Government had printed paper notes to that amount and piled them in the vaults. These \$40,000,000 never were "in the pockets of the people." They never were anywhere. They represent nothing but an illusion, and they might well be dissipated (spent is hardly the proper word) in putting more silver into the silver dollar. At present it is a the boast of counterfeiters that they make as good an article as the Government—equal in fineness and weight—and the profits, at the ruling price of silver, are from 25 to 30 per cent. Let the United States go out of competition with counterfeiters, and their "surplus," as well as its "surplus" (*arcades ambo*), will disappear.

Position of the French Copper Syndicate.

It is a somewhat difficult matter to understand what Congress can possibly do to embarrass the operations of the French copper syndicate or aid manufacturers and consumers to shake off the grasp it now has upon them. A reduction in the present duty on copper and ores of copper, or its entire suspension, would have practically no effect, except in one contingency, which is remote. They might mark up prices in this country, having control of its output, above the prices elsewhere in the world, to the extent of the duty, even if there were sellers in other parts of the globe willing and eager to supply a part of our demand. Exporting our surplus they might use it to whip into line recalcitrant producers elsewhere, and make the consumers in the United States pay the piper. That, so far as we can see, is the only contingency in which the fact that copper was duty free might prove troublesome to the manipulators of the markets.

So far as the American mining companies are concerned their position seems to us to have only one possibly weak point. They can claim justly that they have the right to decide to whom they will sell, at what prices and for how long a time. It is a private business affair, with which no legislature, State or national, has any concern. They have made their sales individually, without any concerted action on their part, and the terms are by no means identical, although they are similar. So far they are invulnerable. But if they have, individually or collectively, made any compact embracing as one of its features an agreement to limit production, their action may be construed to constitute a restraint of trade. So far as we know, that is not an offense which is, or can now be, punished under national laws, but there is a distinct and strong

current in public opinion which favors their enactment and rigid enforcement.

As a matter of fact, the syndicate has placed the limits of its purchases high. So far as is known, they have agreed to take for three years the full product of the mines in any recent year, and, in some cases, have made allowance for a liberal annual increase. Thus, in the case of the Tamarack Company, which produced in the fiscal year ending June 30, 1888, a little over 10,000,000 pounds of ingot, the sale provides for 14,000,000 pounds in the first year, 17,000,000 pounds in the second and 19,000,000 pounds in the third year. The Boston and Montana, which lately reached its greatest output thus far, of 2,225,000 pounds in one month, may deliver 100,000,000 pounds in three years. A similar case is presented, so far as the Parrot, of Butte, Montana, is concerned. It is the knowledge of this fact which has aided in forming the conviction among the majority of manufacturers and consumers that the steadily increased burdens must ultimately break the back of the speculators.

There is little hope for manufacturers and consumers from the agitation now going on. They can only look to natural causes to free them from the incubus under which they are now suffering. We know how keenly they feel it, and since the publication in *The Iron Age* of September 20th of letters from electrical companies, we have had additional communications, showing even more emphatically that important work has been checked by high prices. While there are some who are sanguine enough to believe in an early collapse, we are convinced that a realization of the power of the syndicate has been spreading among manufacturers. It is true that the statistics abroad look black, but they naturally exaggerate in one direction. They deal with the "visible supply" only. They show that a very large part of the metal produced during the past ten months has not gone into consumption. But they fail to indicate, what everybody connected with the manufacturing industries knows, that the whole world has been swept clear of its supplies of old material and scrap, that the stocks of raw material and of partly manufactured goods and of finished articles have been reduced to a minimum. Through the entire period the syndicate has retained its power, and it may well be said that for the present the first most critical period has been passed. The principal sources of supply are under control. In fact, the accumulation of heavy stocks in the hands of the syndicate gives it a means of coercing those who were until now the chief beneficiaries of its operations. So far as the attitude of consumers on the one hand and of the ability of the syndicate to take care of accumulations of metal are concerned, the situation seems pretty well defined, and there is little doubt that thus far the speculators have come out the victors.

It will remain for them to take care of the constant increase in the production of copper from outsiders. At first, the skepticism of every one connected with the copper industry had a powerful influence in deterring others from opening old mines or starting new work. There are probably few who have the reputation of being authorities in the copper trade who

were not asked for their opinion late last year and early this year on the outlook, and who did not hesitate to warn their friends. Later, the collapse in the tin speculation seemed to confirm the views of those who were conservative. It was difficult to find capitalists ready to advance funds to unwater old mines, put old plants into condition for use, or to buy supplies, fuel or new machinery. Since it is known that great financial powers are back of the speculation, since their ability to handle great contracts and to hold enormous stocks are well known, the situation is changed. The promoter has easy work, since no more profitable field can well be found. Nearly every mine, however miserable its past career, now has its enthusiastic friends, and can get money. This country is being scoured by independent prospectors and by the employees of men who are coining money in their present copper investments. Every one reasons that, if the French syndicate can take care of the product of the great mines of the world, it will assume additional burdens from newcomers who demonstrated their ability to be troublesome.

But all this takes time, and this year certainly will pass before much metal can come from new sources. Even later the development of outside production must be slow, and it would seem, therefore, that after having withstood the strain due to the opposition of consumers, manufacturers and the trade, the syndicate will for a time be in a relatively strong position. It has entered this period, which may be prolonged till next spring unless some unforeseen financial disturbances or complications in negotiations with such a producer as the Anaconda mine, of Butte, forces or induces them to change its attitude. For the present there seems little hope of relief.

Interfering with Fuel Oil at Chicago.

The question of cheap fuel for Chicago manufacturers has by no means been entirely settled with the successful operation of the Lima oil pipe line. Fuel oil can now be had in abundance, it is true, and every day sees its more perfect adaptation to all sorts of purposes for which fuel is used, but the insurance companies have stepped in, and, by raising rates on buildings in which fuel oil is burned, have interfered with its general introduction. These companies have convinced the Mayor, the Commissioner of Public Works and the Chief of the Fire Department that the use of fuel oil is dangerous and have received assurances that permits will not be issued for it indiscriminately. The Board of Underwriters then adopted a rule that no risk on property should be taken where fuel oil was used, unless the owner had a permit from the Commissioner of Public Works and the building had been inspected by the superintendent of survey of the Board of Underwriters, and, even then, only at an advance of 1 per cent. on the regular rates. A provision in the rule adopted states that an agent may write a policy, under all proper restrictions, when the fuel oil used is 300 per cent. proof, but oil of that kind is not used for fuel. An ordinance has also been introduced into the City Council to regulate the distribution of fuel oil within the city limits,

but, pipe lines not being contemplated within the city as yet, such legislation is only anticipatory.

This shows that the use of fuel oil in the West will not be very general among manufacturers until the fears of the underwriters are allayed. They have some reason for their hostility to this fuel, as shown by recent disastrous fires in various parts of the country, originating, as they allege, from its use. It is their duty to protect the interests of their companies and to reduce fire risks as much as possible, just as well as manufacturers feel impelled to introduce economies in their various lines of business to secure greater efficiency or increased profits. They cannot be censured for such action, as every manufacturer is to some extent interested in maintaining solvent insurance companies. Should his factory burn he wants the insurance for which he has paid. Underwriters who take risks of any degree of hazard are as much to be avoided as reckless men in any other line of business. But the increased rate which they impose in Chicago for permitting the use of fuel oil will, if enforced, prevent its use, because the enhanced cost of insurance may more than offset the saving as compared with coal. This has been the case at the Leland Hotel, in which oil was used with perfect satisfaction to the proprietor and all concerned, but it had to be abandoned when the rate of insurance was raised 1 per cent.

Insurance companies, like other human institutions, are managed by men who are liable to be erroneously informed or who arrive at conclusions upon insufficient data. It is asserted by the Chicago manufacturers that they have erected storage tanks free of the possibility of explosion, locating them away from all buildings and inclosing them with brick walls, taking every precaution against danger of fire, yet the underwriters have advanced their rates, notwithstanding the belief expressed by experts that such risks were not extra hazardous. To guard against the charge that the insurance companies are seeking to secure an extra profit from their customers under color of the danger attending the use of fuel oil, the underwriters should discriminate intelligently between the person taking necessary precautions and the one using no safeguards whatever. This is the course which should be pursued and which will ultimately have to be adopted. Insurance companies cannot stand in the way of progress. It would be better for them to promote it. They can do this by the very act of exercising discrimination. The varying rates of insurance according to the method of using fuel oil would compel the introduction of the safest and most efficient appliances.

Too much has thus far been accomplished in the vicinity of Chicago in the successful use of fuel oil to let the action of the underwriters interfere very seriously. Both within the city limits and outside of them are large establishments of various kinds whose managers would be very loth to return to the use of coal after having overcome the difficulties attending the introduction of fuel oil. The Union Steel Company have used oil since the 21st of last March for making steam, and hope soon to perfect arrangements for heating steel ingots and blooms with it. Experiments are in progress at the Joliet Steel

Works, and the North Chicago Rolling Mill Company will also probably soon introduce it, pumping their supply from the Standard Oil Company's storage tanks through an independent pipe line to the South Chicago plant. Numerous manufacturing establishments in other lines are using fuel oil and speak well of it. Its use has almost revolutionized brick-making, all the large kilns near Chicago being now burned by oil, with great economy in time, labor and fuel. The absence of smoke is another important result of the use of oil, which makes it a desirable fuel in competition with soft coal. This is a nuisance which Chicago earnestly desires to abate, and the insurance companies should help the citizens in their efforts to get rid of it rather than stand in their way.

The Course of the Lead Market.

The course of lead prices has seldom been so erratic as it has been so far this year. The range in the New York market for common domestic was as follows:

Fluctuations in Prices of Lead, 1888.

January...4.95¢ to 4.90¢	June...3.92½¢ to 4.10¢
February...4.90¢ to 5.15¢	July...3.80¢ to 3.85¢
March...5.15¢ to 5.15¢	Aug...3.85¢ to 4.80¢
April...5.15¢ to 4.60¢	Sept...4.95¢ to 5.05¢
May...4.60¢ to 4.05¢	

Since the beginning of the year the speculative holdings in this city, either in the hands of the chief operator alone and his followers, have been large, most of the time 15,000 tons and more. The parties interested were in hopes that the spring demand would be active enough to enable them to realize advantageously the accumulation then held, bought at all sorts of prices, but in this they were disappointed. The spring trade proved very limited so far as lead manufactures were concerned, the consumption falling 30 per cent. short of the average. The consequence was that pig lead dropped in midsummer to very low figures, all the way to 3.80 cents in the New York market. Several from among the chief consumers in this vicinity availed themselves of this welcome opportunity and laid in a supply which they would otherwise not have bought before September or October. The speculative holdings were thus somewhat reduced, but, with the approach of the fall months, the main operator again increased his interest, and at the same time more active dealings were inaugurated at the Metal Exchange. A serious manipulation had now commenced to obtain control of all the lead available on this coast and dictate terms, if possible, to the consumers that might be compelled to re-enter the market in September and October. But here again there was a miscalculation; in September the trade in manufactures again failed to answer expectations, and during the entire month consumers only bought occasionally small amounts while waiting for a freer development in the demand for their goods. With fair weather and under the impulse of a generally good fall trade October may still bring it; but this is as yet doubtful. In this manner the interest in this great bull deal centers on the month we have now entered. October passed, with not much better results, and an early winter perhaps following, the owners of the present accumulation would find themselves in anything but an enviable position.

At the bottom of the general lead situation on this side there has been all along the reaction in real estate, the decrease of building, and the diminished consumption of lead manufactures, including white lead. But for this great drawback everything might have gone smoothly. It is now hoped that next year will prove very prosperous, in view of the comparatively fine crops we have, and the big prices likely to be realized for them all the way till the next harvest. Building, it is confidently hoped, will then flourish once more, and with it lead manufactures, including white lead, will sell freely at full figures. We trust all these expectations may be fully realized; still, it is a long way off, but this does not prevent the white lead manufacturers from making full preparations even now, nor from trying to concoct a sort of ironclad combination of the "trust" species. On the plea of a more expensive raw material, the price of white lead in oil has been advanced no less than $\frac{1}{4}$ cent. per pound, some 35 leading manufacturers all the way to Omaha having sided with this movement. So far, white-lead combinations have not proved successful, but with better experience they count on good results this time, and, following as they do in the wake of this current which gives birth to a fresh combination of the kind in some branch or other about every week.

In Europe lead has also improved a couple of pounds sterling per ton since summer, not because consumption has gained on production, but because there is now a better prospect that an international lead syndicate will be formed on a basis promising stability. How long such a combination will hold good seems to us doubtful, however, in the face of the large amounts of lead arriving in Europe from a new quarter, Australia. We hear that the proprietors of the Mechernich lead mines and works in Germany are jubilant over the prospect, as they will be particularly benefited, and that the Commern Union, which has lain idle for years, will resume operations. At any rate, taking everything into due consideration, it will be the part of wisdom not to be too sanguine. Production is large, both here and in Europe and Australia; the rise in silver stimulates it still more, while the better times for lead manufactures have yet to come. To put up prices so long in anticipation and thus check and frighten consumption before it freely manifests itself seems to us meanwhile the reverse of a sound policy.

It is interesting to note the degree of popularity which the American naphtha launch has already attained abroad. Thus, following closely in the wake of Messrs. Yarrow & Co., the British builders, to whose so-called "Zephyr" launches we referred in previous issues, comes a Swiss firm, Messrs. Escher, Wyss & Co., of Zürich, who, we are told, recently had under trial a similar boat, with successful results, the principles involved in both vessels being those of the launch first described by us about a year and a half ago and built in New York. It may not be amiss to point out here that, so far from being the result of independent investigation on the part of Mr. Yarrow, the Zephyr launch is built by him under a royalty to the American company, this fact having received no special mention, apparently for business reasons, the idea

having been to allow the English public to fondly imagine the invention of the launch as of English origin. We know nothing definite of the later Swiss launch, but can safely take it for granted, we think, that its details present nothing strikingly new. The results in each case have shown naphtha vapor to be an economical and a generally satisfactory working fluid for an engine, though nothing further in the line of practical examination has been done since the recently noted tests carried out in England and the incomplete experiments conducted in this country several months ago. Promises of new trials, however, have been made, and the prosecution of these will, no doubt, bring forth additional noteworthy and interesting facts.

Commercial Conquest.

The rivalries of commercial nations are bringing about strange transformations. Islands are tossed from one flag to another as dust is shifted in a balance, and through the arts known to diplomacy colonies are being planted here and there in comparatively unknown regions, with reference to an extension of trade rather than the mere acquisition of territory. Hence, it would appear that modern nations accept the fact, which monarchs of the olden time were so slow to comprehend, that "peace hath its victories as well as war"; that, indeed, there is a process of peaceful subjugation far more effective even in a mercenary point of view than is possible through the exercise of mere brute force. At this moment the leading powers of Europe, notably England and Germany, are engaged in schemes for the extension of trade on a scale that would seem to take the entire terrestrial ball within the scope of their ambition, but we seldom hear a hostile gun. Herein do we witness a vast stride in the development of a modern civilization as contrasted with the ensanguined march of armies in the past.

The enterprise which most challenges attention at the present moment is the opening of Central Africa, those almost impenetrable regions in which Livingstone, Stanley and sundry "relief" expeditions have acted as pioneers. Thus far we have heard of British West Africa and a British South Africa, but the exterior line of coast does not suffice as a field for commercial exploit so long as the vast fertile plateaus of the interior, with their swarthy millions of inhabitants, have not been reached.

Two years ago an Anglo-German agreement was formed for the amicable division of a territory in the jurisdiction of the Sultan of Zanzibar, on the Eastern coast, including a strip 150 miles long and 10 miles broad, exclusively for British occupation. This land, acquired originally by a trader named Mackinnon under a concession, has now been transferred to the "Imperial British East African Company," under a royal charter. It comprises the commodious port of Mombassa, capable of holding 20 ironclads, and forms the base of an irregular triangle, having its apex on the Eastern shore of the great inland sea, Victoria Nyanza, and is contiguous to the twin section of territory under German influence. This intermediate tract, with its lands of exhaustless fertility, its forests filled with valuable

woods, is assumed to be the area of grand commercial possibilities. Among the ultimate designs clearly hinted at is the growth of wheat, cotton, tobacco and other products of the soil, which may eventually, like the East Indian possessions, serve as a source of supply for the United Kingdom, independent of all others. As described by a correspondent of the *London Times*:

The interior highlands are in many places peopled by a really fine race, shut out from the coast by Semitic influence. Millions of natives, living in fair and fertile, temperate, and even bracing regions, requiring supplies of clothing, have hitherto been compelled to use hides and skins for clothing for want of better material. This circumstance gives an indication of the vast prospective importance to British manufacturers of cotton goods of the opening up of that immense new market for their products, which promises to be not the least striking result of the development of the company's territories.

Two extensive plateaus have an elevation of some 2500 feet, capable of becoming a permanent settlement for colonists, a new center of trade, and a railway of 300 miles would bring what is believed to be a wheat country of great extent within less than a day's journey of Mombassa, the gateway from the ocean. The great labor problem which this scheme immediately presents is supposed to have its solution in British India, as not fewer than 7000 natives of India have already established themselves as traders and merchants in the Zanzibar dominions, and the Indian Government is favorably disposed to a wholesale emigration. It would appear, therefore, that a vast field, hitherto inaccessible, is freely offered to the commerce of the world, and that beyond, in the interior, like vast spaces in the stellar universe, there are new worlds to conquer. The trade of Uganda, of Unyoro, of Emin Pasha's provinces and the Upper Nile, and around the great lakes, we are told, is bound to be drawn to what will in time be its shortest and cheapest outlet to the coast.

What the Germans are attempting in Eastern Africa we are not privileged to know, but the probabilities of success are apparently as flattering as in the unfortunate island of Samoa, where the efficacy of guns and bayonets is under trial, with the entire population in arms to expel the invaders. And French conquests in Tonquin, if viewed from the commercial standpoint are far from flattering.

In our notice, a few weeks ago, of the steam trials of the Italian ironclad *Lepanto*, some prominence was given to the fact that a large number of locomotive boilers were used on board that vessel with very good results. Those who have followed the performance in the past of boilers of this type in sea service—in torpedo boats, for example, where they are at present used to the exclusion of all others, because of their compactness and capacity for high pressures, are well aware of the unenviable record which they have there established for themselves, giving out with alarming frequency from several causes, prominent among them the failure of the tube plates. The experience gained on board the *Lepanto* would therefore seem to be suggestive of something radically wrong in the ordinary practice of locomotive boiler design for shipboard use. Taking the boiler as a type, simply, it is

natural that the varied circumstances attending its employment have affected, with good or with little reason, some of the details of construction, and in these are easily found explanations for the erratic behavior of the boiler in different situations. Thus, in its legitimate sphere, railroad work, where the boiler could not well be successfully displaced by any other existing form, and where its performance has been all that can be desired under the circumstances, it has some features which are not always found in a locomotive boiler at sea. In the first place, the grate is placed well below the level of the tubes, and then again a fire-brick arch is built in the furnace, affording full protection to the tube sheet against cold-air currents and against the fierce heat of the fire. Examining any of the published designs of torpedo boat boilers we will find that in both these respects there is a marked difference. The brick arch has been left away entirely because of cramped room, and the grate is comparatively high, so that the alternating effects of an extremely high temperature and cold air blasts on opening the furnace doors bear directly and with destructive results on the tube ends and sheets. The Lepanto's locomotive boilers, we find it stated, were fitted as is usual in railroad practice, and, accordingly, as remarked in the report of the trials, they gave no trouble whatever, but furnished every evidence of good working from the beginning to the end of the whole series of tests. It is safe to say, therefore, that if only a true locomotive boiler were tried in all cases at sea it would give complete satisfaction. It should be borne in mind that the torpedo boat boiler upon which unfavorable conclusions have been so largely based cannot, strictly speaking, be called a locomotive boiler, lacking, as it does, some of its essential peculiarities.

Magnetite Ores and Foundry Iron.

The *Journal of the Charcoal Iron Workers* has introduced a new feature in the form of answers to questions suggested by its editor. Among those printed in the issue just published we find the following reply by Edgar S. Cook, manager of the Warwick Iron Company, of Pottstown, to the question, "Why is it difficult to make good foundry pig iron from a burden of all magnetites?"

Good "foundry iron" may be considered a comparative term, for a brand unexcelled for some purposes may be almost worthless for others, and *vice versa*. Within recent years these distinctions are being made with some intelligence and judgment, but there is still room for improvement. Used in a general sense, good foundry iron may be considered soft, open grained pig irons, best adapted to the greatest variety of foundry work, and capable of carrying a large percentage of scrap. For special purposes, equally as good foundry iron can be made from all magnetites as from any other mixture of ores, but as a rule irons made from magnetic ores exclusively will not rank as high as those made from mixtures consisting largely of brown or red hematites.

The difficulty of producing a large percentage of foundry iron with magnetic ores was more marked with the small anthracite furnaces of former years than with the larger and better equipped plants of more modern construction. The use of a portion of coke has made the management also somewhat easier, and consequently enabled the percentage of foundry iron produced to be increased.

The difficulties attending the production of a large percentage of foundry iron from all magnetic ores are due to several causes. Mention will only be made of the leading ones. Within certain limits, the greater the ease with which the iron of an ore parts with its oxygen the more regularly and rapidly will the furnace perform its work of reduction and melting, and the hotter will be the crucible with the same weight of fuel. That the reduction of magnetic ores proceeds more slowly than of brown hematites or red oxides is probably due as much to their mechanical structure as to any difference in chemical composition. Most of magnetic ores available in the Schuylkill and Lehigh Valley districts of Pennsylvania are dense, close, compact ores. These ores, even when entirely free of sulphur, are more or less difficult to work, especially when filled into furnace in large pieces or masses, too heavy for one man to conveniently lift into a charging barrow. The writer has seen the dense New Jersey magnetites so filled into furnaces and at the same time the managers were complaining of the impossibility of making foundry grades, and the tendency of the furnace to work irregularly, or to run off on white iron, without (to them) any apparent cause.

The furnace gases experience more or less difficulty in penetrating, breaking up and de-oxidizing dense ores; they can be broken down more cheaply with hammers. Open, porous ores, or ores containing considerable combined water, are quickly and thoroughly permeated. In consequence, with magnetites there is a greater consumption of heat in the lower parts of the furnace, and, from the presence of ore only partially reduced, there is apt to be sudden variations in the temperature of the crucible. One of the conditions requisite to the production of a large proportion of the higher grades of foundry iron is almost absolute uniformity of temperature of the lower parts of the furnace. The crucible and boshes seem to acquire certain shapes or proportions by graphitic accumulations, without which uniform grades of No. 1 and No. 2 x iron can scarcely be made. Time is required to form these accumulations of graphite, &c., but they are quickly and easily disturbed, and the disturbing cause seriously affecting the product of foundry iron. The use of magnetic ores exclusively renders these disturbances more frequent and less subject to control, owing to the difficulty of thoroughly de-oxidizing them before reaching the crucible. With magnetites forming the burden the rapidity of travel of the stock in the furnace needs to be very carefully watched and the composition of the slag kept as uniform as possible. Any considerable variation in slag, or too rapid or too slow driving (variations that would pass unnoticed with easily reducible ores) are reasonably sure to produce marked changes in the furnace running on dense magnetites.

The objections to structure do not hold good so far as the soft earthy magnetic ores are concerned. These ores, on the other hand, usually carry considerable sulphur, an element which is well known as an unrelenting enemy of foundry irons. When present in the dense class of magnetic ores, it entirely unfits them for the economical production of foundry iron. When thoroughly washed, however, these form fairly good mixtures, as the washing not only removes the sulphur, but also opens the structure of the ores, rendering them porous and easily attacked by the blast furnace gases. Brown hematites and red oxides rarely carry sulphur to any considerable extent, which alone is a decided advantage in their favor in competition with magnetic ores.

Soft magnetic ores, free from sulphur, are fairly well adapted for making foundry grades; with these forming a large part

of the burden no particular difficulty is experienced in making open-grained iron; this would indicate that the difference in chemical constitution between the magnesia and the red oxides is not responsible for the greater difficulty experienced in reducing magnetites.

The grain or fracture of foundry iron by which it is graded does not always indicate how it will work after remelting. The writer has seen large, dark grained and evenly crystallized iron condemned because it ran hard in small thin castings. The fracture of the iron was all that could be desired, and it also had the soft appearance that is familiar to the expert but difficult to describe. This iron proved hard in small castings, owing to the low percentage of silicon it contained (from 0.6 to 0.8 per cent.), and even when melted, without the addition of any scrap, would form a slight chill or hard shell on the surface of a casting in immediate contact with the mold. Experiments in the pig beds showed that this metal gave from $\frac{1}{8}$ -inch to $\frac{1}{4}$ -inch chill as tested in Whitney chill cups.

Foundry irons made exclusively of magnetic ores, whether they be close and dense of structure or of the soft, earthy varieties, are apt to show this tendency more or less; it is this want of uniformity that renders them undesirable for general foundry work, except as mixtures to strengthen the softer or weaker irons. While low silicon in the pig iron is undesirable for foundry grades, yet for mill irons this quality becomes valuable. Hence for the best brands of either grade the average consumer of foundry iron will consult his interest in purchasing his standard iron from furnaces making a specialty of this branch of the business, while the mill manager will avoid the forge grades made by the foundry furnaces and seek his supply of best iron from those blast furnaces making a specialty of mill or gray forge pig iron.

As a rule the gangue of magnetic ores contains but little free quartz or sand, the silicon is usually in combination with alumina, lime or magnesia, and the slag to this extent is partially made, so that the limestone flux added to the ore charge to produce slag of certain composition combines with the gangue of the ore more readily and at lower temperatures than when the gangue is chiefly quartz and sand. In consequence the iron made is less liable to contain reduced silica.

Other causes affect the percentage of silicon in the pig—but they pertain more to the management of the furnace itself than to the ores smelted. Large furnaces and super-heated blast permit of the production of high silicon foundry iron without particularly affecting the economy of the work. The low silicon foundry irons made from magnetic ores give varying results in the foundry, depending upon the knowledge of foremen of the melting departments; these irons, when also low in phosphorus, require more fuel to melt them and to run them as fluid as irons rich in silicon and phosphorus, but the difference in cost of fuel per pound of iron melted is but trifling. While this fact is known to many founders, others conduct their cupolas without regarding the different requirements of irons of various compositions, and as a result many imperfect castings are charged to the iron used when the fault really lies in the management of the cupola.

The grading of foundry iron is troublesome and annoying, as conditions altogether independent of chemical composition change the grain or fracture by which the pig iron is graded, bought or sold. Attention has lately been called to this subject, and I have only to add that frequent mistakes are made at the furnace by breaking and grading pig iron when too warm. Sample pigs are usually taken from about the middle of each bed of the cast. The

pigs should be cold—the temperature of the atmosphere. If only moderately warm the grain will show larger, darker and more even crystallization than when broken entirely cold. If a pig is broken warm and then broken again after losing all its heat the first fracture may show No. 1 grade, while the second, even within a few inches of the first, will be only No. 2, or silver gray. All irons do not alter to the same extent; possibly the higher the silicon and phosphorus the more difference there is in the appearance of the fractures of the same pig broken warm and then cold.

Torpedo Boat Boilers and Engines.

In an interesting article on "Torpedo Boats," contributed to *Industries*, Mr. E. H. Parker says that in all recent constructions of the torpedo boat the locomotive type of boiler has been adopted in order to obtain the highest efficiency in the smallest possible space. As an example of the proportions of the modern boiler employed for this purpose, the particulars of No. 80 of the British Navy may be quoted. This vessel is the fastest in the navy, with an average speed of 23 knots, and her dimensions are 135 feet long by 14 feet wide. This boat is fitted with a locomotive boiler, having a single fire-box, a grate surface of about 46 square feet and a heating surface of about 2300 square feet. Steam is supplied to a set of engines indicating 1650 h.-p., with forced draft, which is equivalent to 40 i. h.-p. per square foot of grate surface. In ordinary merchant steamers only from 8 to 10 i. h.-p. per square foot of grate surface is obtained with natural draft and from 16 to 20 i. h.-p. with forced draft. The chief difficulty with the boilers of these boats has arisen from the high pressure of steam which is usually employed—viz., the rupture of the tubes at their junction with the tube plate. The danger incident upon such a breakage has been considerably diminished by an ingenious device invented by Mr. Yarrow, of London. According to this method the air forced from the fan is made to pass through light non-return valves, which are arranged so that if the flame or steam from any cause has a tendency to rush back, the valves immediately close and cut off communication between the boiler and stokehold.

Economy of fuel is a secondary consideration in torpedo boats. The average consumption at full speed varies from about $3\frac{1}{4}$ pounds to 4 pounds per i. h.-p. per hour. In boats built by Monsieur Augustin Normand, these figures have, however, been very much reduced. With a torpedo boat 124 feet long, a coal consumption of 2.45 pounds per i. h.-p. per hour was recorded. The above table gives the results obtained from long duration trials with six boats built by M. Normand & Co. At the close of last year Messrs. Doxford & Co., of Sunderland, England, completed a torpedo boat in which the furnace is supplied with liquid fuel. In the preliminary trials, the results obtained are said to have been of a satisfactory character. There is one advantage which liquid fuel possesses over coal—that is, with a given weight there is a greater endurance or radius of action. On the other hand, its application in war vessels would involve a serious risk, on account of the possibility of an explosive penetrating the oil tank.

The object which the engine builder has in view is to obtain the greatest propelling power with the least weight of engines, boiler and driving gear. In the earlier first-class boats, the power realized was from 35 to 36 i. h.-p. per ton weight of machinery. In recent boats of the same class, from 40 to 41 i. h.-p. per ton weight of machinery has been obtained. There are also torpedo boat chasers with engines

of 3000 i. h.-p., and weighing only 112 tons, which is equivalent to 27 i. h.-p. per ton weight. In the Sharpshooter, which has been recently completed, the engines drive twin screws, and they develop 4500 i. h.-p. This power is deemed sufficient to attain a speed of 21 knots per hour. The total weight of the propelling machinery, including engines, boilers, water, &c., does not exceed 165 tons, which is equivalent to more than 27 i. h.-p. per ton weight. The small space occupied by the engines is worthy of notice. In the twin screw torpedo boat Ariete, built by Messrs. Thornycroft & Co., each engine develops 760 i. h.-p., and occupies a ground space of only 5 feet 9 inches by 6 feet. Recent first-class torpedo boats carry not less than nine separate and independent steam engines—viz., (1) The main engines, (2) steering engine, (3) circulating pump engine, (4) engine for electric search light, (5) steam donkey, (6) engine for fan blower, (7) engine for patent condenser, (8) two sets of air-compressing engines.

Fires from Steam Pipes.

The second annual report of the fire marshal of the City of Boston, for the year ending May 1, 1888, contains, among other matters, the following interesting information:

I have been able to satisfactorily trace the origin of but five fires during the year to steam-pipes, and the circumstances surrounding these in no way tend to show that wood, in its normal condition—i. e., when free from any previous desiccation, is in danger of becoming ignited in this manner. In other words, ignition in said cases appears to be merely a certain species of what is popularly termed "spontaneous combustion," the steam-pipes themselves being merely one of many indirect factors which often assist in producing such combustion. Although the subject has been discussed pro and con from the year 1846, when Chief Braidwood, of the London Fire Brigade, first addressed the House of Lords on the topic, to the present time, when the opinions of experienced persons interested in the matter seem to be somewhat conflicting, I find by far the preponderance of evidence in favor of the conclusion that wood, subjected for a number of years to the heat of steam-pipes, may eventually reach such a state of carbonization as, with the addition of moisture, exposure to a draft of air, or under the influence of friction, caused by expansion and contraction of the pipes, may break into flame. As the ignition point of ordinary pine wood has been determined, by experiment, to be 700° F., it is evident that this must be reduced by some process, in order to admit of its taking fire at 292°, the temperature of steam under a pressure of 60 pounds.

I have found one of the most frequent causes of fires, which are indirectly traceable to steam-pipes, to be the self-ignition of dust, fluff, small pieces of paper, waste, &c., which seem especially attracted to the neighborhood of inclosed steam-pipes through almost imperceptible crevices. In several such instances the fires have been fortunately discovered and extinguished before doing any harm. P. A. Montgomery, secretary of the Western Manufacturers' Mutual Insurance Company, in special report No. 5 of the Manufacturers' Mutual Insurance Company refers to this same element of danger and suggests, as a remedy, the use of a funnel-shaped casting, cast in two parts, from 3 to 6 inches in height, fitting close at the top, and screwed to the floor, where the pipe passes through; and he further recommends that a thimble of some non-combustible material should be put through the hole in the floor or partition and se-

curely fastened on either side, in order to protect the wood from contact with the pipe.

The light sheathing by which the pipes are often covered, being obliged to constantly absorb the confined steam heat, is extremely liable to reach a dangerous ignition temperature. Sheathing reduced to such condition by being in close contact with the pipe, and so placed as to be susceptible to more or less friction caused one of the five fires herein referred to; another was caused by lumber dust in the dry-house of a planing mill sifting through the floor on to the pipes. The desirability of employing some sort of non-combustible covering for steam-pipes, to prevent their contact with wood, dust, &c., is apparent. They should never be inclosed in wood sheathing. Professor Gibson, in a report to the Manufacturers' Mutual Insurance Company, gives an exhaustive and instructive treatise on the merits of the various kinds of coverings.

Another danger from steam-pipes is the favor with which they are apparently looked upon as offering a desirable neighborhood for the location of rats' nests, in which the phosphorous matches and bits of waste often found therein are in danger of becoming impregnated with the necessary amount of heat essential to the production of spontaneous combustion.

B. P. Hutchinson, or "Old Hutch," as he is familiarly called, is supposed to rule in the Chicago Board of Trade. As promoter of the great wheat corner which culminated last week, after forcing the price up above \$1.50 per bushel, in the effort to squeeze the "shorts," this bold speculator gained a wide notoriety. On Thursday he drew out of the clearing house a check of \$675,000, as his profits on the sales of the day. As described by a correspondent, his favorite way of trading is to pass his card around the pit, with the remark, "Here, boys, put down what you want to buy or sell; I'll accommodate you." He will make trades, and realize on a fluctuation of a sixteenth of a cent. Some days when the humor seizes him he will hold the market within narrow limits and enjoy the discomfiture of the chronic bulls and bears, who vainly endeavor to get prices out of the rut. There are times, however, when the market gets beyond him, and his heaviest trades have no more than a temporary effect. During the late advance a sale of several million bushels stopped the upward movement temporarily, but that was all. More than once he has come to the rescue of the market and prevented it going to pieces. Then, again, as was the case a year ago last June, when the Harper wheat corner broke, he delighted in tantalizing those who had the good of the market at heart, and keeping them and the market on the ragged edge of anxiety. His transactions run up into the millions every week. He is equally at home in wheat, corn, oats or provisions, and no particular pit is favored. He runs them all. There are times, of course, when Armour steps in, but the old man is not even afraid of Armour, with his \$50,000,000.

Messrs. Marchultz & Cantrell, National Iron Works, San Francisco, Cal., are engaged on plans for a new brick machine shop and foundry to be erected on the site of their old works.

The Ohio Valley Foundry, in Bellaire, Ohio, was burned on Sunday. Loss, \$60,000; insurance, \$29,000. The Bellaire Window Glass Works, adjoining, were damaged to the extent of \$10,500. The fire was caused by a natural gas explosion.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., October 2, 1888.

The past week has developed no new features, although it has confirmed the favorable anticipations expressed in recent reports from this office. A large amount of business has been arranged for, and in most cases at steadily advancing prices. The heaviest portion of the orders was taken at low figures, and a fair amount was also taken at advanced rates, but very little has been done so far at to-day's asking prices, although if it becomes absolutely necessary to place orders immediately sellers will doubtless gain their point. Appearances indicate, however, that the most urgent requirements have been satisfied, and both sides are in a position to wait for further developments. The chances are, therefore, that the volume of business will be comparatively light, as buyers see no object in placing orders at advanced prices until they are forced into it, and by the same rule sellers are not inclined to shade their prices until they have more iron than can be delivered on back orders, which is not the case at present.

Pig Iron.—A somewhat irregular, but firm, market has been met with for some time past. As a rule prices are higher, but not in all cases. Limited quantities of good brands can still be had at \$16, \$17 and \$18, at tide, for the three grades, while others of probably very similar quality command about 50¢ more, and those of a specially favorable character command still higher prices, say, \$17 for Gray Forge, \$18 for No. 2 Foundry and \$19 @ \$19.50 for No. 1. All depends on what the buyer requires, quantity, quality, delivery, terms of payment, &c. As a rule there is no doubt that the market is in much better condition than it has been for months past, and, from the lowest point, prices are easily \$1 per ton higher; in some cases more than that. The outlook is also very satisfactory and seems to promise activity and firmness all along the line. The general opinion is that prices are not likely to show much change until after the coming elections. Referring once more to the current quotations for Pig Iron, it may be said that for small lots \$16.50 for Gray Forge, \$17.50 @ \$18 for No. 2 and \$18.50 @ \$19 for No. 1 are fair average prices. Large consumers bought heavily last month at less money, so that there is no demand, except for small lots, and no supply more than is being absorbed from week to week, either on old contracts or on new orders at advanced prices.

Blooms.—Good demand at quoted rates, which are about as follows: Nail Slabs, \$29 @ \$29.50, at mill; Billets from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 per "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29.50 @ \$30.50 for Nail Slabs; \$34 @ \$36 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—There is a good deal of inquiry, but the offerings are light, and at firm prices, say \$28.50 @ \$29 at mill, or \$29 @ \$29.50 delivered. Consumers do not take to these prices very willingly, but from present appearances they will have to do so, as sellers are in a strong position and show no inclination to make concessions.

Bar Iron.—This long depressed department of the iron trade has wonderfully improved during the past couple of weeks. Large orders have been secured, and, as noted last week, prices advanced

to 2¢ for lots from store, and in some cases mills are also quoting 1.95¢ @ 2¢ firm. But some of the mills would probably take 1/16¢ less, so that 1.85¢ to 1.95¢ is nearer the actual selling price for large lots. Some orders for Car Iron (variously estimated at from 2500 to 4000 tons) were taken at figures not over 1.82 1/2¢, in some cases less than 1.8¢, but new business for similar iron, it is thought, could not be placed to-day at less than 1.85¢ @ 1.9¢, but it remains to be seen whether these figures can be realized in actual transactions. Besides orders from the car builders, Wrought-Iron Pipe manufacturers have been heavy buyers of Skelp Iron, so that the majority of mills have all the business they can handle for some time to come. Last sales of Grooved Skelp were at 1.9¢, and that would be an inside figure to-day, and from 2.05¢ to 2.15¢ for Sheared Skelp. Now that these orders have been placed, there may be a period of comparative dullness, but sellers appear to be in a strong position, and are not likely to shade prices to any extent until they need orders more than seems likely in the near future.

Plate and Tank Iron.—This branch of the trade does not keep pace with the one just commented upon. There is a fair demand, and mills are moderately well employed, but the majority would still like a few more good orders at quoted rates, and would perhaps shade a trifle to very desirable parties. The outlook is considered to be very encouraging, but as regards actual business, it is as yet more in anticipation than in definite orders on the books. Prices about as follows: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3 1/4¢; Fire-Box, 3 1/4¢ @ 4 1/4¢.

Structural Iron.—The same remarks would apply as in the foregoing paragraph, although it is felt to be reasonably certain that full employment will be found during the coming winter. There is a good deal of business in hand already, but a good deal more will be required to keep all the mills running to their full capacity, but, as we have said, the chances appear to be very favorable. Prices about as follows: 2.10¢ @ 2.15¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The demand has been quite active of late, and while prices are firm it has not been found practicable to make any advance thus far. Mills are running to their full capacity, and find no difficulty in placing their entire output. Quotations are as follows:

Best Refined, Nos. 26, 27 and 28....3 1/4¢ @ 3 1/2¢
Best Refined, Nos. 18 to 25....3¢ @ 3 1/4¢
Common, 1/16¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28....4 1/4¢ @ 4 1/2¢
Best Bloom Sheets, Nos. 22 to 25....4¢ @ 4 1/4¢
Best Bloom Sheets, Nos. 16 to 21....3 1/2¢ @ 3 3/4¢
Blue Annealed.....2.8¢ @ 3¢
Best Bloom, Galvanized, discount.....62 1/2¢
Common, discount.....67 1/2¢

Steel Rails.—There is more inquiry for rails, but not much actual business has been taken of late. For fall and winter delivery \$29 at mill is quoted, although concessions might possibly be had on very desirable orders. Manufacturers are very cautious in quoting for next year's deliveries, as the cost of production is increasing and present prices are too low to permit of any risks being taken. Probably \$30 might be quoted for that delivery on moderate-sized lots.

Old Rails.—No business to report in this market. There are bids of \$23 for spot T's, with sellers at \$24 for shipment or \$24.50 for lots in store.

Scrap Iron.—Market firm and moderately active, but without change in prices,

which are about as follows: \$20.50 @ \$21 for cargo lots; \$21.50 @ \$22 for carload lots, delivered, or for choice \$22.50 @ \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought Iron Pipe.—The mills are all very busy, the bulk of the demand being for the smaller sizes. Prices continue firm, and are generally adhered to. Discounts are quoted as follows: Black Butt-Welded, 55¢; on Galvanized do., 45¢; on Black Lap-Welded, 65¢; on Galvanized do., 52 1/2¢; on Boiler Tubes, 60¢.

Nails.—A slightly improved demand is the only feature worthy of note. Prices do not improve to any extent, although mills are looking for an advance at an early date and say it would prove beneficial to the trade at large, and claim that at the prices now ruling it would pay better to stop the machines. We quote \$2 for small lots from store, with the usual discount on large quantities.

By Telegraph.—The market for Bars and Skelp Iron shows increasing strength and activity; a large amount of business is offered at full prices, but sellers now ask 2¢ for Skelp.

E. J. Etting, of Philadelphia, has been appointed agent for the sale of Wire and Wire Rope made by the Trenton Iron Co., of Trenton, N. J. Quotations on application to Mr. Etting, 222 South Third street, Philadelphia.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, October 1, 1888.

Pig Iron.—The condition of business has been very much the same as the preceding week. Buying was largely confined to small-lot orders. One sale of 2000 tons Charcoal Iron for Car Wheels is reported. The period of delivery covering ten months forced the purchaser to pay a small advance on prices for immediate shipment. Furnacemen do not anticipate much change in the prices of iron for this year's delivery, but, at the same time, are not willing to make additional contracts at prevailing figures when deliveries extend beyond December. Some furnaces have contracted so far ahead that they claim to be temporarily out of the market. There is no anxiety on the part of sellers to take orders, at least not enough to offer concessions to buyers who are still in the market. Freight rates from Mahoning and Shenango valleys to Chicago have been advanced 15¢ per ton, taking effect to-day. This will have no direct effect upon business or prices, as the advance was anticipated on late sales and former rates on existing contracts protected by railroads. The Southern Coke furnaces have adopted the system of grading which is used by all Northern furnaces and announce that all shipments on and after October 1st will be made under the new schedule. We change our nomenclature to correspond with the circular published elsewhere. We make the following cash quotations, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$19.50 @ \$20.50; Alabama Car-Wheel, \$26.25; Jackson County Softeners, No. 1, \$18 @ \$18.50; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband) No. 1, \$19 @ \$20; other Ohio Scotch Irons, No. 1, \$18 @ \$19; Lake Superior Coke, No. 1, \$17.50 @ \$19; No. 2, \$17; No. 3, \$15.50 @ \$16; Southern Coke, No. 1 Foundry, \$17.75 @ \$18; No. 2 Foundry, \$17 @ \$17.50; No. 3 Foundry, \$16.75; No. 1 Soft, \$17.25; No. 2 Soft, \$16.75; Gray Forge, \$16.25.

Bar Iron.—The demand is principally for small lots both from consumers and country dealers. From the latter mixed orders covering a variety of articles not classified as Bar Iron, to make up a carload, are very common among large jobbers, one house reporting an average of 8 to 10 cars a day. Large buyers are either supplied or waiting for future events. It is said that the mills are full of work and stocks in jobbers hands in good shape, but not large. Prices are quoted at 1.90¢ in carloads and 2¢ in small lots from store. Mill price, Chicago delivery, range from \$1.75 to \$1.80 to most of the trade, and claims of weakness made by some who wish to place orders.

Structural Iron.—The season is so far advanced that new business is confined to small lots from stock and deliveries under contract. Mill prices f.o.b. Chicago are: Angles, 2.25¢; Universal Plates, 2.25¢ @ 2.30¢; Tees, 2.50¢; Beams and Channels, 3.40¢. Store prices: Angles, 2.40¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢.

Plates, Tubes, &c.—Some improvement in the demand for Heavy Sheets is noted, though orders, as a rule, are for small lots at full market prices. No new features are mentioned in connection with the trade on Plates and Tubes. Store quotations are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢ @ 2.70¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 62½¢ off.

Sheet Iron.—It seldom occurs that this market is not well supplied with Light Sheets. In fact, the supply has usually been so abundant that consumers gave themselves no concern about obtaining material in advance of their requirements. The condition, however, is very different this fall. Buyers are searching in every quarter for stock that cannot be had. Jobbers who are regularly receiving a portion of their supply under contract say that it is distributed as fast as it comes in, never remaining long enough in their hands to be stored. All numbers are scarce, but No. 26 seems to be most wanted and the most difficult to obtain. On recent inquiries mills quoted on a basis of 3.30¢ for No. 27, Chicago delivery. Jobbers' prices from store are 3.20¢ for No. 24; 3.50¢ for Nos. 25 and 26 and 3.40¢ for No. 27.

Galvanized Iron.—The volume of trade continues to be very large, but the broken line of stock is a menace to increasing the business to still greater figures. In dull times the special brands have the preference with consumers at a shade higher prices, but in the present condition of the market all good Iron is in demand and commands the same price. The quantity of Iron consumed by the Cornice trade this season is much less than for several years previous. Out of store jobbers quote Juniata at 60% off and Charcoal at 60% and 5% off for small lots.

Merchant Steel.—The immediate future gives no promise of buyers for general consumption breaking loose from their established policy of ordering small lots of Steel as they need it. Implement manufacturers having placed their orders for the year's supply, business resumes the old rut of a half-alive trade and irregularity in prices. Regular store quotations are as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢. The above prices are frequently shaded. The demand for Plow Steel in special shapes this season has been considerably above the average.

Steel Rails.—Small lots aggregating perhaps 10,000 tons were booked in this market during the past week for delivery this fall. Negotiations have been opened with some roads for Rails to be delivered in the early part of next year, but no sales are reported. It is rumored that one mill offered to accept an order for 5000 tons, March, 1889, delivery, at less than \$30 per ton. The statement has neither been verified nor denied. If true, it is reasonable to suppose the low figures were made for the purpose of securing enough work to keep their mills in operation during the winter months. Rail-makers here repudiate the statement published in the daily press that the American Association contemplate forming a combine with foreign manufacturers. Mills continue to quote as a nominal price \$30 @ \$31.

Old Rails and Wheels.—Dealers report that there were no transactions in Old Rails during the past week. On one lot of 500 to 1000 tons \$24, Chicago, was offered and refused. Holders are asking about \$24 at yard, and mills are unwilling to pay more than \$24 at mill, one buyer having offered \$23, Chicago, the rate of freight being 75¢ between this and the point of consumption. The demand for Old Steel Rails has also been very light. Nominal quotations for long lengths are \$19.50; Short Ends, \$16.50. Car-Wheels are reported very scarce and the market quiet. Quotations range from \$19 to \$20, according to the selection.

Scrap Iron.—Few transactions in the Scrap market have occurred. Prices asked by dealers are somewhat higher than mills feel warranted in paying. The demand does not seem to be very urgent, and both sides are holding pretty firmly to their ideas. We make the following quotations per ton of 2000 lb: No. 1 Forge, \$19.50 @ \$20.50; Track, \$18.50 @ \$19.50; No. 1 Mill, \$14.50 @ \$15; Tank and Pipe, \$13; Sheet, \$9.50; Horseshoes, \$19; Axles, \$25; Cast Machinery, \$14.50; Stove Plate, \$11; Cast Borings, \$8.75; Locomotive Tires, \$16.50; for Mixed Country Scrap dealers offer \$13.50 @ \$14.

Hardware.—Business among the larger jobbing houses continues to be very active. Competition has become quite strong and those who have the most adequate means of purchasing goods and canvassing the trade are reaping the greatest benefit from the season's business. The demand for fall goods started up at least 30 days earlier than usual, but it does not now look as though this would bring a decline in the demand any earlier than in former years. The excellent crops and the recent great advance in the price of wheat in this market are being felt throughout the Northwest. The impression prevails that the advanced prices for grain will continue during the winter and give to consumers a better supply of money than they have had for a long time. While there is a general hardening of prices all along the line, Lead and Tin and articles in which they are largely a part of the manufacture are most conspicuous in the advance. Prices have been fairly well supported during the entire season, and business in the aggregate has been much better, notwithstanding frequent cuts on specials or leaders.

Nails.—The demand for Nails at this season is a little disappointing. Trade is referred to as being lighter than for several years before, though prices continue to be pretty well maintained. Steel Cut Nails are quoted at \$2.05 @ \$2.10, carload lots, and \$2.15 from store, in small lots. Wire Nails, \$2.50 @ \$2.60. The Paralle! Chisel Pointed Nail is beginning to be recognized as a factor in the trade for which there is considerable demand for sample lots. Manufacturers quote \$2.50 rates, Wire Nail card.

Barb Wire.—The condition of the market remains unchanged. The demand continues very light and only for small quantities. The stocks in manufacturers' hands are large, but those in the hands of jobbers are lighter than usual. Quotations are nominally 2.90¢ for Painted and 3.65¢ for Galvanized.

Pig Lead.—Consumers have taken a trifle more interest in the market during the week and prices ruled steady at 4.90¢ @ 4.95¢ for October delivery.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, October 1, 1888.

The opening up of nearly all the channels of transportation, which has occurred during the past two or three days, has given a stimulus to business, and trade in nearly all lines has resumed, practically, its normal condition. There is now no interruption in traffic between this point and any of the trade centers of the South, with the exception of perhaps one or two in Florida, and a few days will probably remove them. Merchants and railroads are already beginning to feel the beneficial effects of the unusually large crops that have been raised throughout the entire South, and from the present time forward there is every likelihood of a period of great activity in all lines of business. Many of the railroads have, during the present year, endeavored to fortify themselves on the question of transportation by adding very much to their rolling stock, but still the deficiency is very great, and some of the largest furnaces are beginning to be inconvenienced for want of cars to haul their stocks and take away their products.

Pig Iron.—There is no particular change to note in this article. The demand is fully equal to the output of the furnaces, and prices are being well maintained. The local demand fell off slightly during the past two or three weeks, but there is no doubt that it will soon assume its usual proportions, as there are now no practical obstructions in the way. From inquiries that are being received from Southern foundries it is fair to presume that the consumption from this quarter will considerably exceed any former period, as the winter months are generally the most active with them. The Western markets appear still to be the most favorable ones to which the Southern furnaces can ship their output, although the East is not behind in their requirements. There have not been the large transactions that have characterized the trade in times gone by, but sales are confined more to small round lots, and inquiries from speculators have not been as frequent as they were some weeks ago. Upon the whole, the market is in a very satisfactory condition, and the furnaces are being kept comfortably sold ahead on current demands.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts.,
CINCINNATI, October 1, 1888.

Pig Iron.—In general the local market for Pig Iron has been quiet, yet the volume of business has not been small, and a few large buyers are reported to have entered the market quietly, made several large contracts and retired, without knowledge by the trade at large of their presence. A confident tone has prevailed, but there has been no advance in market prices. There is scarcely a new feature in the Iron interest proper upon which to dwell; sellers are satisfied for the time being, and buyers are not anxious. Transportation rates from Southern furnaces to

points on and north of the Ohio River have been advanced 15¢, and some purchases and contracts have been made recently at the old schedule. The local money market is extremely easy, unusually so for this season. Among the sales, in addition to the large contracts previously referred to, are 800 tons of Southern Car-Wheel Iron, 100 tons per month for eight months, at \$24.50, cash, and \$25, four months' time; 500 tons No. 2 Southern Foundry, at \$16.50; 600 tons No. 1 Mill at \$15.25, and moderate amounts No. 2 Mill at \$14.50 per ton, cash. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$17.50 @	\$18.50
Southern Coke, No. 2.....	16.50 @	17.50
Southern Coke, No. 3.....	15.50 @	16.00
Ohio Soft Stone Coal, No. 1.....	17.00 @	17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @	16.00
Mahoning and Shenango Valley.....	17.50 @	18.50
Hanging Rock Charcoal, No. 1.....	20.50 @	22.50
Hanging Rock Charcoal, No. 2.....	19.50 @	22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @	19.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @	18.00
Forge.		
Strong Neutral Coke.....	14.75 @	15.25
Mottled Neutral Coke.....	13.50 @	14.00
No. 1 Mill Coke.....	15.00 @	15.50
No. 2 Mill Coke.....	14.50 @	14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @	23.00
Hanging Rock, Cold Blast.....	22.00 @	25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @	21.50

Manufactured Iron.—There has been an increased volume of business and a much stronger tone. The orders from Stove manufacturers are liberal and the demand for Sheet Iron is especially active. One thousand tons Bar Iron sold at 1.70¢ at the mill. Full prices on all kinds are now realized, and an advance is imminent. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3½¢ @ 4½¢ per lb.

Nails.—The market has ruled strong in tone, in sympathy with Pig and Manufactured Iron, and a fair volume of business has been transacted. Jobbing prices are based upon 12d @ 40d, which sell at \$2.10 per keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2.10 and Steel Wire Nails at \$2.75 per keg.

Old Material.—The market has been unsettled; the offerings of Old Wheels have been freer and prices have declined. At the close it would be difficult to sell Old Rails at \$23.50, but several days ago this rate was bid here, and sales were made in St. Louis at \$24, cash. Old Wheels have met less inquiry, but the offerings are not large; the nominal quotable rate is \$19 @ \$20, spot cash.

Louisville.

LOUISVILLE, KY., October 1, 1888.

Pig Iron.—The market has remained steady during the past week. Sales of Iron in small lots have been made, with no large transactions to report. It is thought, however, that during the next two or three weeks the market will be more active and that prices will slightly advance. The contemplated change of names to designate the grades of Southern Irons in accordance with other localities takes effect October 1. Fifteen furnaces have agreed to follow out this plan, which, it is thought, is an advantageous one. Old Rails continue active, prices being held firm at \$24. Old Wheels at \$21. It was thought that the trouble in the South over yellow fever would curtail the production of Pig Iron, but furnaces have continued to run steady, and the output has been fairly good. We quote as follows:

Southern Coke, No. 1 Foundry.....	\$17.00 @	\$18.00
" No. 2.....	16.00 @	16.50
" No. 2½.....	15.50 @	16.00
Hanging Rock Coke, No. 1 Foundry.....	17.25 @	17.75

Hanging Rock Charcoal, No. 1 Foundry.....	21.00 @	23.25
Southern Charcoal, No. 1 Foundry.....	18.00 @	18.50
Silver Gray, different grades.....	14.50 @	15.25
Southern Coke, No. 1 Mill, Neutral.....	14.75 @	15.25
" No. 2.....	13.75 @	14.75
" No. 1 " Cold Short.....	14.25 @	14.75
" Charcoal, No. 1 Mill.....	15.75 @	16.50
White and Mottled, different grades.....	13.50 @	13.75
Southern Car-Wheel, standard brands.....	23.00 @	24.00
Southern Car-Wheel, other brands.....	19.25 @	21.25
Hanging Rock, Cold Blast.....	22.25 @	25.25
Hanging Rock, Warm Blast.....	19.25 @	20.25

Cleveland.

CLEVELAND, October 1, 1888.

Iron Ore.—The market has lost some of its activity by reason of the fact that the Hard Ores are nearly all sold up and buyers are hesitating about paying the advanced price for other brands. Ore consumers in the East are making heavy demands, and are said to have purchased 25,000 tons of non-Bessemer Hematites at \$4.40, the same Ore having sold at the opening of the season for \$3.75. Additional sales of a second-class grade of Bessemer Ore have also occurred, the price paid being 60¢ in advance of midsummer quotations. Transportation rates have advanced another point, and the consequent addition in the cost of Ore at the mines causes buyers to hesitate about taking Ores that would be eagerly purchased at 30¢ per ton less. Furnacemen insist that the condition of the Iron market does not warrant them in paying high prices for Ore. There is little doubt, however, about the sale of all the Ore mined. With all the advances made during the past three weeks, prices for Ore are still \$1 below those prevailing at a corresponding period last year. The season's shipments closely aggregate 3,310,000 tons, and will undoubtedly aggregate 4,000,000 tons by December 1.

Pig Iron.—Mahoning and Shenango Mill Irons have advanced 50¢ per ton, and a still further increase in price is anticipated. Select Foundry is bringing \$18, and Mill Irons are quoted at \$16, cash. Dealers report the market very firm, with an upward tendency all around, although Lake Superior Charcoals are somewhat weak.

Manufactured Iron.—Structural Iron sells very freely. Bar Iron at \$1.70 is in excellent demand, and Sheets at \$3.10 for No. 27 are eagerly inquired for.

Scrap Iron.—Old American Rails are still held at \$25, and, although a few scattering sales are reported, there is a general belief that such a price cannot be much longer maintained.

Nails.—Steel Wire Nails have advanced a point, but local dealers have cut common Iron Nails to \$1.90, and Steel Nails to \$2 per keg. Cut Iron Spikes have advanced to \$2.50, and Steel spikes to \$2.75.

Detroit.

WILLIAM F. JARVIS & Co., under date of October 1, report as follows: While the market has shown no signs of weakness during the past week, the volume of business has been a little under that of the previous one. The demand for 50 to 100 ton lots has been up to the average, but no very large sales have been made. Car-Wheel Irons are in the best demand, and more inquiries are received for high numbers than is usually the case, thus showing that Old Car-Wheels are scarce, and what few lots are offered are held at from \$1 to \$1.50 per ton above price of regular brands of L. S. Charcoal. With a quiet but firm market we quote as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @	\$20.50
Lake Superior Coke, all ore.....	19.75 @	20.25
Lake Superior Coke, cinder mixed.....	18.50 @	19.00
Standard Ohio Black Band.....	19.75 @	20.25
Southern No. 2.....	17.75 @	18.25
Southern Gray Forge.....	16.25 @	16.75
Southern Silvery.....	17.00 @	17.50
Jackson County (Ohio) Silvery.....	16.50 @	17.00
Old Wheels.....	20.50 @	21.50

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., Pittsburgh, October 2, 1888.

River navigation is again suspended, which, of course, restricts business somewhat; but it is not a matter of so much importance now as it was some years ago, before we were so well supplied with railroads. It will not be many years before the Ohio River is slack-watered all the way from Pittsburgh to Cincinnati, a distance of almost 500 miles; and once it is, the Ohio Valley will be filled with manufactories; as it is, this great valley is becoming noted more and more every year for her manufacturing interests. In addition to Iron, Steel and Glass, the potteries of East Liverpool and brickyards of New Cumberland are looming up. Nearly all manufacturers between Pittsburgh and Wheeling are supplied with natural gas, and, in not a few instances, at a less price than the Pittsburgh manufacturers have to pay. Here the cost of gas has been almost doubled within the past year, and some consumers have gone back to coal.

Pig Iron.—There has been no important change in the situation during the past week. Business continues quiet as compared with what it was a few weeks ago, but still there is a very fair degree of activity. The outlook indicates that there will be a good, healthy trade for some time to come, and the apprehension entertained of a speculative movement has subsided. There is some Iron held on speculation, but it does not amount to much, and is not likely to have any effect upon the market. Some furnacemen refuse to sell to speculators. We quote prices as follows:

Neutral Gray Forge.....	\$15.50 @	\$16.50	cash.
All Ore Mill.....	16.75 @	17.50	"
White and Mottled.....	15.00 @	15.50	"
No. 1 Foundry.....	18.00 @	18.50	"
No. 2 Foundry.....	17.00 @	17.50	"
No. 1 Charcoal Foundry.....	24.00 @	24.50	"
Cold Blast Charcoal.....	25.00 @	27.00	"
Bessemer Iron.....	18.00 @		"

Included in the sales reported was a lot of 12,000 tons Gray Forge, standard brand, for immediate delivery, at \$16.50, cash, but this is an outside price; brokers state that they have very good Irons to sell at \$16.25, and even \$16, cash. We can report sales of some 3000 tons Bessemer, at \$18, cash.

Muck Bar.—There is less inquiry, and, while prices remain unchanged, the market is weaker; we continue to quote at \$28.50 @ \$29, cash, as to quality, delivery, &c. There is nothing like the demand there was a few weeks ago.

Ferromanganese.—Sales of 80 ¢ at \$55.50, cash; Speigel quoted at \$28.50, cash, for 20 ¢.

Manufactured Iron.—There is a continued fair degree of activity. Orders are still coming forward pretty freely, and the mills generally are pretty well employed. Some of them have all they can do. Manufacturers continue to complain that prices have not advanced sufficiently to cover the enhanced cost of the raw article, and it was this more than anything else that arrested the upward course of the latter. We continue to quote Bars at 1.80¢ @ 1.85¢; Plate, 2.20¢ @ 2.25¢, and No. 24 Sheet, 2.80¢ @ 2.85¢; Skelp Iron is in good demand, and prices are quoted steady at the recent advance—Sheared: 2.12¢ @ 2.15¢, Grooved, 1.85¢ @ 1.90¢.

Nails.—There is a continued fair business, although the factories here are by no means busy, but it is all possibly that we can reasonably expect at this particular time and under existing circumstances. So far as we can learn, full card rates are still being realized, and there is no room to cut, as the cost of Nail Plate has gone up fully \$1 per ton. Pittsburgh manufacturers are refusing to make any concession whatsoever from the card, and there is

reason to believe that Wheeling manufacturers are acting likewise. We continue to quote at \$1.90, 60 days, 2 % off for cash.

Wrought Iron Pipe.—There is a continued good demand for small sizes; large sizes continue dull, owing to the fact that natural gas companies are buying very sparingly as compared with former years, as those points near to the gas territories are pretty well "piped." Prices remain unchanged with the exception of Boiler Tubes, which are higher. Discounts on Black Butt-Welded Pipe, 55 %; on Galvanized do., 50 %; on Black Lap-Welded, 65 %; on Galvanized do., 55 %; Boiler Tubes, 62½ % off; 2-inch Tubing, 13¢ per foot net; 5½-inch Casing, 40¢ per foot net, large lots.

Steel Rails.—Heavy sections are still quoted at \$29.50 @ \$30, free on cars at mill.

Billets.—Bessemer Steel Billets are still quoted at \$29 @ \$29.50, cash, delivered on cars at makers' works; sale 1000 tons at \$29 and 500 tons Nail Slabs at \$29. Sales of Bloom and Rail Ends (domestic) reported at \$19 @ \$19.50.

Old Rails.—There has been very little business during the past week; consumers generally are pretty well stocked and for the time are out of the market; however, the offerings are light and prices are fully maintained. We continue to quote American Tees at \$25 @ \$25.25, with some few small sales reported within the range.

Merchant Steel.—There is a fair business at unchanged prices. Tool Steel, standard brands, 8½¢; Crucible Machinery, 5¢; ditto Spring, 4½¢; Open Hearth Machinery, 2½¢.

Railway Track Supplies.—No change reported in prices, but there is a possibility that they might be shaded on a desirable order. Spikes, 2¢, 30 days, delivered; Splice Bars, 1.80¢ @ 1.85¢; Track Bolts, 2.85¢ with square and 2.95¢ with hexagon Nuts.

Old Material.—There is less doing, but prices are maintained. No. 1 Wrought Scrap, \$21, net ton; Car Axles, \$26 @ \$27; Wrought Turnings, \$14.50 @ \$15; Cast Scrap, \$16 @ \$16.50, gross; Old Car Wheels, \$20, gross.

New York.

Office of *The Iron Age*, 66 and 68 Duane street, NEW YORK, October 3, 1888.

American Pig.—The week has been uneventful, sales being on a moderate scale, but at firm prices, though it is reported that some of the Southern furnaces are less sanguine of the immediate future than they have been of late. Reports relating to the condition of consumers vary. The general conclusion, however, seems to be that the majority of them have covered their requirements for the next few months, and that that is particularly the case with those who secured low rates of freight by canal. It is insisted, however, that others have not yet bought all that they need, and their appearance in the market is looked forward to in the near future. Standard No. 1 Northern Iron is still available between the range of \$18 and \$19, while No. 2 is quoted at \$17 @ \$17.50, and Gray Forge, nominally, \$16 @ \$16.50.

Scotch Pig.—From Albany and Troy and from New England come reports of greater interest on the part of foundries in those substitutes for Scotch Iron which are chiefly used in the West—that is American Scotch of the Mahoning Valley and the Jackson County softeners. We hear that these are offered at Albany at \$20 @ \$20.75, with reports of shading

under the former figure for some grades. When it is considered that it is necessary to add from 70¢ to 80¢ to the price of tide-water foreign Scotch prices to arrive at the figures for the same point, it will be observed that there is considerable saving to those who use the American product. Some sellers of Scotch Iron in this market are still placing a little at figures which are below the cost price on the basis of present freights. This they are able to do, since they have freight room contracted at lower figures. We quote: Coltness, \$21.75 @ \$22, nominally; Shotts, \$20.50 @ \$21; Langloan, \$20.50 @ \$20.75, and Dalmellington, \$20.25 @ \$20.50.

Spiegeleisen.—Besides a lot of 10,000 tons of 10% closed recently, we hear of sales of over 5000 tons of 20 % Spiegel, for early delivery, all at private terms. A part of this was afloat in sailers, so that low figures could be made. For the same delivery steamer shipment would be necessary, which would cost from \$27.50 to \$27.75. For later delivery, \$27 may be quoted for English. The rise has been due both to high freights on the metal and particularly to scarcity of Ore and high freights thereon. Thus we hear that 19/ was paid for freight on Manganiferous Ore from Spain to Maryport, England. In Ferromanganese similar quotations of freights exist. Foreign is quoted \$55 @ \$56 at tide. We hear of a small lot of domestic 80 % sold by second hands at \$56, delivery Wheeling.

Plates.—We quote Iron Tank, 2.1¢ @ 2.2¢; Shell, 2.3¢ @ 2.4¢; Steel Tank, 2.2¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.65¢ @ 2.75¢, and Fire-box, 3.5¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢.

Steel Rails.—There is an evident disposition to keep sales as quiet as possible, and the impression is gaining ground that in reality more has been done than comes to the surface. We hear of sales by Eastern mills aggregating about 16,000 tons, a part of it for early delivery, and also of 20,000 tons sold by one Western mill during the past four or five days. An effort is being made to secure somewhat better prices for delivery in 1889, the aim of the Western mills being \$31 at Chicago, and of the Eastern mills \$29 at mill. We do not hear of any business having been done at these figures. We continue to quote, for winter delivery, \$28 @ \$28.50 at Eastern mill.

Wire Rods.—The only transaction of any consequence reported is a lot of 1200 tons of foreign for the St. Louis market, to be shipped via New Orleans. We quote \$39.50 @ \$40.

Old Rails.—The market has been very quiet, no sales of any consequence being reported during the week under review. It is generally conceded that the feeling is a little less heated, and we hear of at least one lot of Tees being offered at \$23.50. It is evident that the majority of the Eastern and Western mills have pretty well covered requirements for the present, with one notable exception, and it is likely that for the next 30 or 60 days they will hold aloof. We hear that a growing number of trades have been made with Steel mills, which have taken the old material and furnished new Rails to the purchaser.

Scrap.—We hear of the sale of a number of lots, between 200 and 300 tons each, at \$21 from yard, and \$21 delivered to lighter. The market is strong at the close.

Fastenings.—Manufacturers continue to ask \$2.25, delivered, for Spikes. Angle Bars are 2.05¢ @ 2.10¢.

Financial.

Accounts from some sections of the South are rather more favorable, indicating some relaxation of the quarantine imposed at various points, and jobbers in this city are receiving a renewal of orders for merchandise; but September will not make as favorable a showing in the amount of sales as the corresponding month last year. Railroad traffic is remarkably good, so that, although the season for increased activity has hardly opened, some of the principal lines complain of their inadequate equipment. Wild speculation in wheat has caused much disturbance, but the effects, it is believed, must be temporary. The enormous corn crop, on account of scarcity in Europe, must move forward in full volume, as the failure of the harvest in Germany is attracting attention. Herr Richter, in an article in the *Liberal Zeitung*, calculates that Germany will require 13,000,000 hl. of grain to meet the deficiency. The people, he says, must therefore demand an immediate diminution of the duty on cereal imports. The official report of the crops in France shows that 7,055,161 hectares of land were this year planted with corn, yielding 96,430,062 hl., against 8,967,466 hectares in 1887, yielding 112,456,107 hl. The Washington weather crop bulletin shows conditions favorable for cotton, cane and rice during the past week. The financial outlook is also favorable, both as regards the general market and the Government Treasury. It is a fact worthy of special observation that with the reduction of \$12,000,000 and upward in the public debt during September the aggregate interest-bearing debt for the first time drops below the \$1,000,000,000 limit.

The Stock Exchange market has been active and strong, mainly on the announcement that the Granger roads had come to a harmonious agreement respecting rates, the St. Paul having assented to a restoration of former tariff. London prices were higher, with some buying orders. Reading was heavy on the report of decreased net earnings. On Friday, as on the previous day, the market was in full possession of the bulls. The adjustment of Northwestern rates was considered important, especially for the reason that failure had attended previous efforts to bring the Burlington and Northern and other belligerent roads into line. On Saturday speculation was again buoyant. Southern stocks were bought on reports of low temperature in that section, which indicated the possibility of early frost, the abatement of yellow fever and the consequent resumption of traffic. On Monday the news that the Chesapeake and Ohio would be reorganized without foreclosure started the stocks and bonds of that company upward. Coalers were bought freely. On Tuesday the tone was unsettled by the dearer money and news of the failure of the Traders' Bank of Chicago—an event which proved to have little significance.

United States bonds are quoted as follows:

U. S. 4½, 1891, registered.....	108
U. S. 4½, 1891, coupon.....	108
U. S. 4, 1907, registered.....	129
U. S. 4, 1907, coupon.....	129
U. S. currency 6s.....	121

The wheat market, especially during the latter part of the week, has been much excited by speculation in Chicago, but prices here have been seriously disturbed. The immediate effect was to paralyze the export movement. On Friday one of the oldest firms in the trade was unable to meet its obligations, but in the final settlement there were no serious consequences. With wheat in Chicago advanced to \$2 per bushel for September, spot stock in New York advanced on Monday 3¢ to 3½¢ per bushel compared with Saturday, and speculative trading was on an enormous scale, but there was no cash demand.

On Tuesday wheat again advanced 3¢ over the previous day, and the deal is still going on. Corn also advanced. Cotton was dull. Coffee was quiet at a slight advance in futures. Petroleum was strong, with a fair business for export. Provisions were excited and higher, but declined with the advance in wheat. Sugar is strong, but easier for refined, which is now 1¢ per pound higher than before the trust. The Bay State Refinery, in Boston, shut down by order of the trustees, to check production, and orders were received to shut down the big refineries of Decastro & Donner, in Brooklyn.

The law firm of Shipman-Barlow, Laroque & Choate sent to the Farmers' Loan and Trust Company a certified check for \$112,664.84 in settlement for the moneys which James E. Bedell, their employee, obtained from the trust company by means of bogus mortgages.

The weekly bank statement showed a large increase in surplus reserve, amounting to \$2,813,450. This makes the surplus now held \$14,757,175, against \$9,017,100 at the corresponding time last year and \$5,963,925 in the first week of October, 1886. In loans there was a further contraction of \$690,000; the specie is increased \$4,726,700; the legal tenders are down \$1,311,800, the deposits other than United States are increased \$2,405,800, and the circulation is down \$1,091,300. The improvement is largely due to Treasury operations, its disbursements being far in excess of the interior demand for funds. Money on call is 2 @ 3%. Time loans are quoted at 3% for 60 days, 4% for 90 days, 4½% for 4 months, and 5% for 7 months. Single-named paper sells at 5 @ 6%, and fair indorsed at 5%. The total amount of bonds purchased under the circular of April 17 is \$60,186,900, of which \$41,631,700 are 4's, and \$18,555,200 are 4½'s. Their cost was \$73,340,268, of which \$53,415,353 was paid for the 4's, and \$19,924,915 for the 4½'s. The public debt was reduced \$12,247,026 during September and \$23,709,000 during the last three months. Net cash in the Treasury amounts to \$9,644,845, against \$10,676,320 on September 1. The public money in national banks amounts to \$57,817,385. The receipts for September were \$31,698,174; for three months, \$97,526,253; expenditures, \$80,161,197.

Sterling exchange is quiet, with rates about \$4.84½ for long bills, and \$4.88½ for demand. In London, the condition of the money market is uncertain on account of the possible continued withdrawals of gold for South America, where the speculative fever has broken out anew. The *Economist*, of September 22, says: "Judging from the ease that prevails in the New York money market, there does not seem much likelihood of gold being taken for that quarter this autumn, even though we have to buy more wheat than usual, and have to pay higher prices. Gold will not go in payment of these purchases unless it is needed on the other side, and at present it looks as if no such need will arise." The aggregate clearings of 38 cities for the past week show an increase of nearly 10½%, outside New York the increase was 10½%. New York shows an increase of 10.3%, Boston 13½, Philadelphia 4.6, Chicago 20.7, St. Louis 17.4, Baltimore 27.8, Kansas City 11.3, Omaha 22.1, Minneapolis 7.9, Denver 24.5, Galveston 24.7, Detroit 12, Peoria 33.9, Duluth 21.9, Topeka, 26.7, Cincinnati, decrease, 2.4, New Orleans 14.9, Louisville 5.9, Milwaukee 10.8, St. Paul 2.3, Indianapolis 11.8, Memphis 12.3, Wichita 22.6, Norfolk 26.1.

The official reports from Washington of the foreign commerce of the United States for the month of August show a remarkable change, the imports having fallen off from \$73,430,384 to \$59,929,185. For

eight months of the calendar year the comparison is as follows:

	1886.	1887.	1888.
Total exports.	\$488,789,465	\$459,413,678	\$440,223,691
Total imports.	483,229,769	504,539,992	504,568,814
Excess of im-ports.	\$45,123,314	\$64,345,123
Excess of ex-ports.	\$25,539,696

For the first eight months of 1886 the exports from the United States exceeded the imports over \$25,000,000. For the same months of the current year the balance is reversed and the imports exceed the exports upward of \$64,000,000, making a difference in the balance of trade of about \$90,000,000.

The imports of merchandise at this port during the week were valued at \$8,495,000, of which \$2,792,000 represent dry goods. Since January 1 the total is \$352,141,000, as compared with \$354,124,900 for the same time in 1887 and \$328,021,000 in 1886. The exports were \$7,196,743.

According to the Custom-House report, the exports of specie from this port during the week were \$344,000 and the imports \$85,000. The total since January 1, respectively, is \$28,569,000 and \$6,674,000.

According to the estimates made by *Bradstreet's*, the total number of failures in the United States during the nine months of 1888 is 7330. This indicates on a basis of the record for five years past a total of 10,180 failures for the calendar year 1888. The total number of failures in 1887 was 9740. The increase in assets of failing traders, accompanied by the decrease of about one-seventh of the liabilities, as compared with 1887, constitutes a favorable feature of the exhibit, and an examination of the figures shows that the improvement has been general.

The annual report of the Produce Exchange for 1888-89 shows a net surplus of \$69,232.27, a gain of \$7684.21 over 1887-88. The report of the Gratuity Fund—which was, of course, prepared before Foster's defalcation was discovered—states the surplus or guarantee fund to be \$1,138,573.96.

Coal Market.

Coal is in rather better demand with the approach of cold weather, and a fair business is reported at the advanced prices, but the furor lately experienced is gradually subsiding. At a meeting of the New York Coal agents on Friday, it was determined to make no change for October, and the same was true of the Lehigh Coal Exchange. The companies all report a large business in hand on former orders sufficient to keep them busy for some time ahead. This is true more particularly of orders for the domestic sizes, and for Pea the demand is increasing. To some extent the latter is finding a sale for domestic purposes. Efforts are now chiefly directed to the supply of those points which are liable to be closed by the suspension of navigation and the latter are given a preference. The Western market is absorbing large amounts. Fancy brands are in demand up to the full limit of supply, but the demand for manufacturing sizes is comparatively slow. Inadequate means of transportation continues to cause complaint, interfering with prompt delivery. The Reading company are enlarging their sources of supply in Lykens Valley, also in the Mahanoy region, where a mammoth 50-foot vein lately struck is spoken of as a "bonanza." Tidewater prices are believed to be fully maintained, but it is supposed that the maximum for the season has been reached. Quotations are as follows: Hard White Ash, Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Fine White Ash, Broken, \$3.95; Egg, \$4.30; Stove, \$4.65, Chestnut, \$4.55.

Production for the week ended September 29 is on a scale of magnitude unprecedented for this season of the year, from which it may be inferred that operators are fortifying themselves in anticipation of actual needs. For the week the tonnage is 889,553, against 711,248 for the corresponding week last year, and since January 1 27,591,000, as compared with 25,374,000 for the same time in 1887. The Pennsylvania Railroad transported during the week 223,000 tons of Coal, and since January 1 8,427,000 tons, an increase of nearly 1,000,000 tons compared with last year. Reading's shipments comprised 194,000 tons, of which 32,000 went to Port Richmond and 10,000 to Elizabethport.

Bituminous Coal is in good demand; prices irregular. There is some delay in shipments.

Contracts have just been awarded by the Pennsylvania Railroad Company for the construction of a Coal pier at Harsimus Cove, Jersey City, 1200 feet long by 80 feet wide, on which is a trestle for cars, so that Coal can be dumped directly into vessels.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from September 24 to September 29, and from January 1 to September 29, inclusive, were as follows:

	Sept. 24 to Sept. 29.		Jan. 1 to Sept. 29.

Metal Market.

Copper.—London has been unsettled and lower, with spot Chili Bars, which gave way from £101 to £96 owing perhaps to the unfavorable statistics, the visible supply on October 1 being 89,154 tons in England and France, against 94,170 on September 1. Futures meanwhile rose from £77 to £79. 10/; good merchantable brands declined from £78. 5/ to £78. Best Selected is cabled £82 this morning. Here the shorts covered on Monday, November and December contracts at 17.70¢ @ 17.75¢; since then the market has become weak and unsettled at 17¢, bid for spot and October, and 17.30¢ November, with offerings at 17.75¢ @ 17.95¢. The closing prices at the Metal Exchange to-day were 17.10¢ bid, 17.90¢ asked. The consumptive demand for Copper is represented as being good, and the lowest at which the syndicate has been willing to sell is, we hear, 17.70¢. The following was telegraphed from Washington:

The Senate Committee on Finance to-day began the inquiry into the operations in this country of the French Copper syndicate. The witnesses examined were Charles H. Pine, of Ansonia, Conn., treasurer of the Parrot Silver and Copper Mining Company, of Montana; Charles Raht, of New York, a Copper broker, and John Stanton, of New York, treasurer of three lake Copper mining companies. It was

explained by all the witnesses that the Société took all the surplus Copper produced in America and sold it abroad, paying the American companies one-half of the sum realized above 13¢ ¢ lb, and making the deficit good when the price realized was less than 13¢, whether sold at home or abroad. The Société had the right at all times to fix the price of sale. The Société had contracts, witnesses understood, with practically all the mines in the country. The Société had not a monopoly of Copper manufacture in France, although it controlled many mills. No Copper had been imported into this country for several years. All the witnesses agreed that but for the protection afforded by the tariff originally neither the mines of Lake Superior, Arizona nor Montana would or could have been developed. The protection afforded by the tariff had made the United States the largest Copper producing country in the world. A few years ago—in 1883 and 1884—the English market controlled the prices of Copper, and English speculators so manipulated the market as to run the price down below the point where American mines could be worked with profit. It was at this juncture that the Société began its operations and it had increased the price of Copper to a paying basis.

The import into Liverpool and South Wales from January 1 to September 17 of American Copper has been 18,991 tons, as compared with 7881 tons same time last year.

Tin.—This metal has been ill sustained in the London market, declining as it did from £103. 17/6 to £101. 15/, spot, and from £102. 17/6 to £101. 15/; total sales, 260 tons. The visible supply is reduced but little, being on October 1 12,451 tons, against 12,740 on September 1 and 11,907 on October 1, 1887. Here the available supply is light, hence the spot figure is sustained at 23.55¢, but in a speculative way the tendency has been downward, the dealings summing up about 100 tons, October selling from 23.10¢ down to 22.85¢, 22.65¢ being bid for November, but 23.10¢ @ 23.25¢ asked. From January 1 to August 16, the latter inclusive, the Straits Settlements shipped to the United States 19,348 piculs of Tin. At the Metal Exchange 10 tons prompt shipment still brought 22.95¢ and 10 tons November the same figure. The closing price to-day was 23.90¢ asked. **Tin Plates.**—The demand has been rather quiet for the past week, partly accounted for by the fruit-packing season being about over. Prices are a shade easier on the spot. The inquiry for futures has fallen off somewhat. The quotation at Liverpool still continues at 14/ for Cokes, but it is being shaded in actual business. We quote at the close, large lines, ¢ box: Siemens-Martin Steel, Charcoal finish, \$5.25 @ \$5.75; Coke finish, \$4.70; Terns, \$4.30 @ \$4.40; Bessemer Cokes, \$4.60 @ \$4.62½, and Wasters, \$4.30.

Lead.—Since our last week's report 1094 tons were sold on the Metal Exchange, October from 5.05¢ to 5.10¢, and even 5.12½¢, closing at 5.10¢, and November at 4.95¢, the market being rather unsettled; still the spot price to-day is 5.12½¢. The closing price at the Metal Exchange to-day is 5.02½¢ bid, 5.10¢ asked. Consumers did little or nothing. There have been rumors of a revival of the Corroders pool, and the thing seems to be in a fair way toward accomplishment. In London, meanwhile, Soft Spanish dropped from £14. 17/8 to £14. 15/, while English Pig is cabled 15/.

Spelter.—The market here has become a little livelier; under 5½¢ no Domestic Spelter can be had; Silesian cannot be laid down here for less than 6¢, as it has improved to £19. 2/6 in London. The Vieille Montagne Company have raised the price for Sheet Zinc 2 francs ¢ 100 kg.

Antimony.—Hallett advanced to £42 in London; we quote the same 10½¢ here and Cookson 12½¢. There is a fair jobbing demand and the market is steady.

New York Metal Exchange.

The following sales are reported:

FRIDAY, September 28.	
200 tons Lead, October.....	5.05¢
SATURDAY, September 29.

65 tons Lead, October.....	5.02½¢

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Oct. 3, 1888.

Information comes from a trustworthy source that late negotiations between M. Secrétan as representative of the so-called "syndicate" and the several copper mining companies for an extension of existing contracts have resulted favorably. It is stated, in fact, that contracts with the leading companies will be closed within the next ten days for their entire production for a period of nine years at £72 per ton. A certain amount of the profits over and above that price will be shared with the various companies, according to the proportion of their output. The production will be restricted, but as yet particulars do not come to the surface on this important point. The announcement is reflected in a hardening tendency to the market for Chili Bar futures, and of prices for outside brands, the latter showing 25/ rise, with the tendency still upward. Furnace material is also higher and in active demand, mainly from smelters. James Lewis & Son report sales of 2000 tons Anaconda Matte at 15/3 ¢ unit and 500 ditto at 15/4½ ¢ unit. Sellers now ask 15/6, an advance of 6d the past few weeks. The business in spot Chili Bars the past week has been confined mainly to closing out old contracts, and, as purchases to cover short sales were smaller than they have been heretofore, prices show some decline.

The Block-Tin market has received a very fair measure of support during the week from purchases reported to be for American account. From other sources the demand has been moderate. American orders have dropped off somewhat the past few days, however, and prices have weakened a little in consequence and there has been limited trading. There is no material change in the market from the statistical standpoint.

In the Tin Plate market the situation is practically the same as it was a week ago. There is considerable inquiry, but buyers and sellers are wide apart on prices in negotiations involving large lots, and transactions are therefore of moderate volume.

Prices for Pig-Iron "warrants" generally have averaged somewhat lower, consequent upon more or less disposition to realize profits and more aggressive methods pursued by "bear" operators. The home demand for consumption continues active, however, as does also

he export trade, and this, coupled with the lively trade in Finished Iron and Steel, acts as an offset to "bear" operations in the "warrant" market. However, maker's brands of Scotch are 6d. to 1/6 off, and Hematites have sold from second hands at 1/6 decline. Spiegeleisen is a shade higher and very firm. Steel Rails have dropped over 5/ under sharp competition; but Billets and Slabs, on the other hand, are held at a slight advance.

There has been a livelier demand for Old Iron Rails, and bids are reported that come very near to holders' figures. The drift of the American market is watched with considerable interest. The endurance of the strength reported there and the outcome of the present demand will be largely instrumental in shaping this market. At the present time £3. 2/6 for Flanges and £3. 5/ for Double-Heads, f.o.b., are apparently sellers' lowest figures.

Scotch Pig.—Business fairly active, but prices affected by the decline on warrants.

No. 1 Coltness, f.o.b. Glasgow	50/6
No. 1 Summerlee, " "	52/
No. 1 Gartsherrie, " "	46/6
No. 1 Langloan, " "	49/6
No. 1 Carnbroe, " "	43/6
No. 1 Shotts, " at Leith	48/6
No. 1 Glengarnock, " Ardrossan	46/6
No. 1 Dalmeilington, " "	43/
No. 1 Eglinton, " "	42/
Steamer freights, Glasgow to New York, 10/ Liverpool to New York, 10/.	

Cleveland Pig.—The demand has slackened somewhat and prices are not so firm. No. 1 Middlesboro', G.M.B., 37/; No. 3 do., 34/6.

Bessemer Pig.—Prices have weakened under pressure to sell at second hands. Business liberal at the decline. West Coast brands, mixed numbers, 44/6, f.o.b. shipping point.

Spiegeleisen.—Offerings are moderate, and higher prices are asked. English 20% quoted 78/6, f.o.b. N. W. England shipping point.

Steel Rails.—There has been a fair business at somewhat lower prices. Standard sections quoted at £3. 16/3 @ £3. 17/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—The market fairly active, and prices very firm. We quote £4 @ £4. 1/3 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—Demand continues brisk and prices are firm. Bessemer, 2½ x 2½ inch, £4. 1/3, @ £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—Business moderate and prices unchanged. Mild Steel No. 6 quoted at £5. 18/6 and No. 5 at £5. 17/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—Very little demand, but offerings moderate and prices firm. Bessemer, £4 @ £4. 1/3, f.o.b. at N. W. England shipping point.

Old Rails.—Transactions moderate, but holders very firm. Tees held at £3. 2/6, and Double Heads £3. 5/, f.o.b.

Scrap Iron.—Demand very slow and prices weaker. Heavy Wrought quoted at £2. 5/, f.o.b.

Crop Ends.—The market quiet, but very steady. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Manufactured Iron.—There is still a good business, and prices remain very firm. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d.	£ s. d.
" Common	@ 7 12 6	@ 5 2 6

Staff. Bl'k Sheet, singles	@ 5 2 0
Welsh Bars (f.o.b. Wales)	@ 4 17 6

Tin Plate.—Demand is quite active, and moderate sales have been made at higher prices. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/6 @ 16/
IC Bessemer steel, Coke finish	14/3 @ 14/6
IC Siemens	14/6 @ 14/9
IC Coke, B. V. grade	14/ @ 14/3
Charcoal Terne, Dean grade	12/6 @ 13/

Tin.—Very little change is apparent in the situation. Straits quoted at £101. 15/ @ £102, spot, and £102 for three months' futures.

Copper.—Future Chili Bars and Best Selected very firm, with fairly good demand. Chili Bars, £96 @ £98, spot, and £79. 10/ three months' futures. Best Selected, £81. 10/.

Lead.—The market has continued strong, with demand good. Soft Spanish, £14. 17/6 @ £15.

Spelter.—The market firm and fairly active. Silesian, ordinary, £18. 17/6 @ £19.

WEST INDIES.

PORT OF SPAIN, TRINIDAD, August 31, 1888.—**Asphaltum.**—Our market has been moderately active and steady at \$14.4 per ton for Boiled and \$6.84 for Crude, f.o.b., export duty included. Shipments during the first eight months amounted to 37,891 tons, against 29,578 tons last year, and 22,614 tons in 1886. *Exchange*, 90 days' sight on London \$4.86 @ \$4.88.—*E. P. Masson.*

CHILI.

VALPARAISO, August 3, 1888.—**Copper.**—Although cable advices from England have been favorable enough, the volume of dealings has remained restricted for the lack of copper offering for sale, nearly all that can be shipped before the end of next month being disposed of. Sales figure up 10,742 quintals all told at \$29.45 @ \$30; the price of \$29.85 equals £75. 5/6, with 26/6 steam freight. *Nitrate.*—There has been a revival in the demand, but not much has transpired in the way of sales, because of the extreme stiffness exhibited by holders. Sales aggregate for the fortnight 220,000 quintals at \$2.70 @ \$2.80; the price of \$2.75 for 95% equals 8/4½, with 27/6 freight and 26½ d. exchange. Futures, September to November, are worth \$2.72½ @ \$2.77½. July shipments to Europe have been 37,000 tons, and to the United States 2500; loading 1st inst., 85,000 and 6000 tons respectively, chartered in July for Europe 39,800 tons, and for the United States 3200. *Coal.*—Continues drooping, Newcastle being offered at 40/ and June shipments having been paid 35/. *Exchange*, 90 days' bank, 26½ d.—*Weber & Co*

EAST INDIES.

SINGAPORE, August 8, 1888.—Our last report was dated 25th ult. **Tin.**—The sales have amounted to 300 tons, and supplies are coming in more freely; we close with buyers at \$35 and sellers at \$35.25. Shipments this month will probably exceed 1500 tons. *Gum Copal.*—There is hardly any demand and stocks are large. *Gum Damar.*—No transactions. *Tonnage.*—London rates are steady at 25/ @ 30/ for weight and 36/6 @ 40/ for light stuff. New York via canal, there is no tonnage offering. Via cape, the Tabique and Maccabeo are loading and the Sonntag has been fixed to arrive at 25/ for weight and 30/ for light stuff. *Exchange* is steady at 3/1½ for six months' sight credits. Total Tin shipments from the Straits Settlements to the United States during the first seven months have been as follows: 16,520 piculs, against 46,858 in 1887, 40,706 in 1886, 16,471 in 1885, 37,408 in 1884 and 67,119 in 1883.—*Gillfillan, Wood & Co.*

PENANG, August 17, 1888.—**Tin.**—The market opened a fortnight ago at \$34.15 per picul in order to improve to \$37.10 subsequently, and finally wound up at \$35.90. Receipts for the two weeks have been 10,000 piculs, of which

Europeans took 3700 and Chinese 6300. *Exchange*, 4 months' bank, 3/1.—*Schmidt, Kustermann & Co.*

MANILA, September 24, 1888.—**Hemp.**—There are buyers at \$9.87½ per picul, against \$10.50 same time last year, the former figure equaling per ton, cost and freight, £32. 17/6, and the latter £37 5/. There have cleared for the United States since last cable 12,000 bales, against 4000, and since January 1st, 137,000, against 154,000. There are still loading for the same destination 36,000 bales, against 55,000. The clearances for Great Britain since January 1st have been 252,000 bales, against 157,000 last year, and there remain loading 13,000, against none. There were cleared for all other ports 55,000, against 30,000, whereas receipts from all ports since last cable amounted to 18,000, against 13,000 bales, and since January 1st they have been 457,000 bales, against 367,000 last year, and 294,000 in 1886. *Freight*, \$6, against \$5.50 in 1887. *Exchange*, six months' sight, 3/5½, against 3/8½ last year.—*Ker & Co. to Charles Nordhaus, 89 Water street, New York, per cable direct.*

BOMBAY, August 15, 1888.—**Petroleum.**—There have been sold in this market during the fiscal year from June 1st, 1887, to June 1st, 1888, 870,000 boxes of refined Petroleum of 10 gallons each; 320,000 came from America, and 550,000 from Russia, both 125° Government test, each box containing two tins of 5 gallons each. The American oil brought on an average 3.70 rupees per box; the Russian, 3.50, there being but a slight difference in the quality. Russian has been well introduced, is popular, and seems to have a good future before it. Sunflake American of 150° can be placed to a moderate extent at a higher figure, but the bulk of consumption runs on American and Russian of 125°.—*Times of India.*

GERMANY.

HAMBURG, September 22, 1888.—**Pig Iron.**—There has not been much of a change except so far as Spiegel is concerned, for which at a reduction in price to 53 marks for 10 to 12% large American orders have been filled. The remaining sorts have been neglected, with the exception of Thomas. The general demand for Forged Pig is rather slack. Luxembourg has nevertheless remained steady; Finished Iron has been slightly looking up lately, the domestic inquiry increasing a little, and to some extent it is also moving off more readily for export. Orders received are all to the close of the year. The lowest figure for Rod Iron at a recent adjudication at Cologne was 115 marks, and the highest 128. Beams are selling as largely as ever; Hoop Iron has undergone no change. Without exception the works turning out boiler plates are as fully engaged as ever at firm prices; thin sheets still lag behind. The Wire branch reports no particular change except that there is for the time being less fear of the syndicate dissolving. A continued good trade is reported by foundries, machine shops and car works. The latest adjudication of Steel Rails that came off in Baden showed the lowest figure to be 120.50 marks per ton delivered at Mannheim. We quote at the close Bessemer Steel Billets 135 marks and Steel Rail for mines 115. During the first nine months the export of Finished Iron from Germany has been only 101,940 tons as compared with 199,902 same time last year, and of Hardware, &c., 482,277, against 541,469—together 582,217, against 941,391 last year. The import was as follows: Finished Iron this year 116,320, against 82,258 last year, and of Hardware 20,020, against 28,358—together 142,340, against 112,616. *Metals.*—Lead continues rising, and Copper and Spelter are both firm. International Lead Syndicate negotiations proceed successfully; Mechernich and the Commern Union will be largely benefited should the matter be clinched.—*Borsenhalle.*

Alex. Laughlin & Co., engineers and contractors, of Cleveland, Ohio, report, under date of October 1, that they have contracted with the Ohio Iron Company, Zanesville, Ohio, to erect, equip and place in operation at their works one regenerative gas furnace, with working hearth 7 x 18 feet, together with the artificial gas producers necessary to operate the same. They have also closed contract with the Lake Erie Iron Company, of Cleveland, Ohio, to erect a furnace, with working hearth 7 x 14 feet, for heating iron for their 9-inch train; and have just completed two furnaces for the Knoxville Iron Company, Knoxville, Tenn., and two for the Belfont Iron Works Company, Ironton, Ohio, which are working in a very satisfactory manner.

Hardware.

During the past week there have been comparatively few changes in price, and the volume of business about as at our last report. Orders are coming in freely and indicate a good condition of general business. Manufacturers in some lines are behind their orders and seasonable goods especially are in excellent demand.

Cut Nails.

The New York market has not improved so far as prices for Iron Nails are concerned, low sellers cropping up periodically. In Steel Nails the situation is somewhat different. For some time, until lately, any differences in price between the two materials had practically disappeared. Now they are again being insisted upon by some manufacturers of Steel Nails declining to meet the low prices on Iron Nails. We quote \$1.85 @ \$1.90 for carload lots of Iron Nails.

Barb Wire.

The New York Barb-Wire market continues steady, with about the same conditions as were alluded to in last week's report. The present price in New York for carload lots may be quoted as 3.6 cents for four point Galvanized, small lots being sold at 3.8 to 3.87½ cents. Manufacturers are evincing a conservative disposition in regard to booking orders for future delivery.

Miscellaneous Prices.

The price of goods in which Copper enters largely remains generally without change, it not being found feasible to advance the quotations in accordance with the advance in the raw material. Some manufacturers also have had large stocks of Copper, which have enabled them to produce the goods without the increased expense of the metal at prices now ruling. Referring to this feature of the market a well-known manufacturer writes:

We have found the same demand for our goods this year as we did last. The Presidential election does not seem to affect our trade. The only serious trouble this year is the advance in the price of Copper which has been brought about by the Copper syndicate. With the competition we have it is impossible to get the advanced price for our goods to correspond with the advance in Copper. It is not very pleasant to know that the great industries of our country are held down by the throat by a few French-Jew bankers in France, who have control of the metal that is of so much importance to the interests of our country.

The Grand Crossing Tack Company, Grand Crossing, Ill., have issued what they designate as a net price list, which is of interest, especially as it indicates their method of putting up Tacks. In this pamphlet the regular Tack list is dispensed with and net prices are named on the goods, which also in some lines are put up in new ways. For example, the first page of the list is occupied with prices on Copper Plated, Tinned, Silver Steel and Blued Steel Carpet Tacks, prices being given on the Tacks with 75, 100, 150, 200 and 250 Tacks in a paper. As illustrating their method, we reproduce below their quotations on

Blued Steel Carpet Tacks.

75 Tacks in a paper.	100 Tacks in a paper.	150 Tacks in a paper.	200 Tacks in a paper.	250 Tacks in a paper.
oz. per doz.	per doz.	per doz.	per doz.	per doz.
6.....\$0.08½	\$0.07	\$0.13	\$0.13½	\$0.16½
8......07½	.08	.14½	.15	.18½
10......08½	.09½	.16½	.17½	.21½
12......09½	.10½	.19	.20½	.24½
14......10½	.12½	.21½	.23	.27
16......12	.13½	.24	.26	.29½

The company also explain their method of putting up Carpet Tacks in cases containing a wide variety of assortments, both as to the number of Tacks in a pasteboard

box and the number and assortment of boxes in a case. For example, the cases contain 100, half gross or one gross, of boxes, which in turn contain, as above, 75, 100, 150, 200 and 250 Tacks, either Silver Steel, Tinned Steel, Copper Plated or Blued Steel. As illustrating this method of putting up the goods, and the assortments, we give below the prices of cases containing 100 papers with 100 Tacks in each:

	Silver Steel.	Per Case.
[1001]	6 8 10 oz.	
	30 40 50 bxs.....	\$0.71
[1002]	6 8 10 oz.	
	20 50 30 bxs.....	.72
[1003]	8 10 oz.	
	60 40 bxs.....	.75
[1004]	8 10 12 oz.	
	30 40 30 bxs.....	.81
[1005]	8 10 oz.	
	50 50 bxs.....	.76
[1006]	6 8 10 12 oz.	
	15 40 30 15 bxs.....	.75

Blued Steel.
Same Price as Silver Steel.
Tinned Steel.

		Per Case.
[1101]	6 8 10 oz.	
	30 40 30 bxs.....	\$0.83
[1102]	6 8 10 oz.	
	20 50 30 bxs.....	.84
[1103]	8 10 oz.	
	60 40 bxs.....	.87
[1104]	8 10 12 oz.	
	30 40 30 bxs.....	.94
[1105]	8 10 oz.	
	50 50 bxs.....	.89
[1106]	6 8 10 12 oz.	
	15 40 30 15 bxs.....	.87

Assorted Cut Tacks and other goods are put up similarly. Prices are also given on the other goods in the varied line made by the company.

Chas. A. Bowen & Co., Sterling, Ohio, issue a circular relating to Taft's Vise Wrench, in which they illustrate its special features and allude to its advantages. It is quoted at a discount of 50 and 10 per cent. from the regular list.

Sterling Wrench Company, Sterling, Ohio, alluding to their additions to their manufacturing facilities, make the following quotations on Wrenches of their manufacture:

	Discount.
No. 1, Machinists'.....	70&10
No. 2, Agricultural.....	80&5

A slight decline has taken place in both Manila and Sisal Rope, the prices of which have fallen off ¼ to ½ cent per pound. This is owing to competition between the different markets, and the price is regarded now as more settled.

The prices agreed upon by the manufacturers of Sheet Copper, &c., have for some time been well maintained, but there are indications of slight concessions, as some new competition is entering the market.

An advance has been made in the price of Emery Wheels, by which the general discount on 1 inch and larger has been fixed at 55 per cent, and on smaller than 1 inch at 45 per cent., subject to a discount of 2 per cent. for cash.

The price of the Standard Apple Parer, made by the Henry C. Hart Mfg. Company, Detroit, Mich., is \$9 per dozen, with a discount of 50 and 10 per cent.

In the Ammunition market the irregularities to which we have heretofore referred continue without abatement and with some increase. A large business is being done by the manufacturers and dealers at regular prices, but goods continue to be offered by houses who are not in contract with the association at cut prices, and it appears that such houses are enabled to procure the goods required for their trade with less difficulty than earlier in the season. The extent to which such irregularities are carried is regarded by many as indi-

cating an indisposition on the part of the association to prevent them, growing probably out of a conviction on their part that it would not be feasible to do so. The present system, which has for a long time served a good purpose in securing a general maintenance of prices, has apparently ceased to meet the existing conditions, and it would not be surprising if some new arrangement were found necessary to accomplish the desired results.

Obituary.

In the recent death of Augustus Stanley, New Britain, Conn., another veteran manufacturer has been removed from that busy city. His connection with the manufacture of Rules commenced in 1854 as senior partner of the firm of A. Santley & Co. In 1857 the business of this firm was consolidated with others in the organization of the Stanley Rule and Level Company. Mr. Stanley has been one of the directors of the company since its incorporation, and, until recently, was actively identified with its manufacturing interests. His loss is sincerely mourned in the community where he spent his whole life and was best known.

Charles B. Tatham, who died on Thursday, September 6, at his residence, 276 De Kalb avenue, Brooklyn, was born at Elwood, near Philadelphia, in 1811. In 1838 he came to this city, and together with Benjamin Tatham, a brother, established the house of Tatham Brothers, engaging in the manufacture of lead. This house carried on the business in conjunction with a Philadelphia house, conducted by the three brothers, Henry B., William P., and George N. Tatham. Some years ago the house moved from Water street to its present place, 82 Beekman street. Mr. Tatham was ill about a week, dying at the age of 77. He leaves a widow and one son.

The death of N. Murphy, of the firm of N. Murphy & Son, Erie, Pa., is announced. Hereafter the business will be carried on by H. H. Murphy and Fred. Murphy under the firm name of Murphy Bros.

Trade.

From our Louisville correspondent we have, under date September 29, the following advices in regard to that market:

For the past week the Hardware trade of Louisville, Ky., has been quite up to promise, and the last few days were brightened by a few orders coming voluntarily from the section of the South afflicted with yellow fever. Business has undoubtedly been seriously affected by the scare, but is satisfactorily righting itself into a more natural state.

Consumers and country merchants in the infected districts are beginning to realize that they will need quite as much, or even more goods than usual, on account of the abundant crops, which in turn give heavy tonnage to the railroads, and when they prosper Iron, the index to trade, receives an impetus that benefits all lines. Bar Iron is held firmly by the mills, giving the dealers opportunities to advance on their late low prices, and sells readily at \$1.75 from store for common. Some mills are feeling the market for another advance. The dealers, though, deprecate such action, and would prefer to see prices remain steady. Sheet Iron is scarce from the mills; those usually supplying this market are not able to take any new orders, and are very backward in filling the ones already booked.

Cut Nails are also firm, dealers' large stocks going off readily. Jobbers should get more for them than they do, this stock being used by many as simply a leader to sell other goods. Wire Nails are in fair demand from store. Very few mills show any desire to take orders at less than price adopted at last meeting of the association.

Barbed Wire is quiet, but firm. The mills being satisfactorily fixed on contracts, and raw material higher, there are no inducements to shade prices. The jobbers' trade is fair, Wire selling from store at full figures.

Items.

It will be seen in the special announcement on page 82, that the Palmer Hardware Mfg. Co., Troy, N. Y., have discon-

tinued infringement suits against the Empire Portable Forge Company, Cohoes, N. Y., to whom a license has been granted for the manufacture of the goods in question.

The Gibbs Lawn Rake Company, of Canton, Ohio, will hereafter be represented in Chicago by J. E. Davis & Co., 115 Dearborn street, in place of Hiram Sibley & Co. A speciality of the company to which they call particular attention is the Gibbs Post-hole Digger, which they refer to as meeting with much favor and increasing sales.

Hibbard, Spencer, Bartlett & Co., of Chicago, are building up a large trade in Lamps, the assortment they offer enabling them to supply a complete line for every use. Their orders recently received cover almost every part of the West, extending up into British Columbia.

It is reported that the Russians are complaining of the falsification of trade-marks and imitation of foreign manufactures by the Germans. According to a paper read before the Pan Slavist Society for the Promotion of Industry and Trade, Germany is said to be filling the Russian markets with her home-made English, French, Belgian, and American manufactures. And these goods, notwithstanding their inferior quality, find ready purchasers. According to M. Pobudoff, the reader of the paper, real English Plows and American Sewing Machines are all but unknown in Russia, the German imitations supplying their places.

The Calumet Iron and Steel Company, Chicago, Ill., whose Parallel Sided Chisel Pointed Steel Nail was illustrated in our last issue, call the attention of the trade to the merits possessed by it and the advantage with which it may be handled by the Hardware trade. They state that with the view of introducing these Nails they will send sample lots of five kegs or more, and, on receipt of specifications, will quote bottom prices. The manner in which they call attention to it is shown in their advertisement.

The Rogers & Hamilton Company, Waterbury, Conn., issue a circular relating to the Rogers & Hamilton Combination Set, No. 32. The Knives are described as made from crucible steel plated 14 dwts., and after plating hand burnished, making them especially durable. The Forks are made from nicked silver, and are plated by their sectional plating process, which is illustrated in their advertisement on page 102.

The Samuel Winslow Skate Mfg. Company, Worcester, Mass., issue a neat catalogue of Ice Skates for the season 1888-89. It represents a varied line, of which illustrations are given, with list prices. Extra parts are also represented, with price list.

The Merriam Mfg. Company, Durham, Conn., announce that they have purchased the Mosler Index Combination Lock and that the Yale Lock Mfg. Company have improved the same by substituting a revolving dial for the pointer heretofore used thereon. It will hereafter be known as the Yale Dial Lock, and its exclusive use, as applied to tin boxes, is retained by the Merriam Mfg. Company, the Yale & Towne Mfg. Company having modifications of this Lock adapted for use on drawers, desks, tills, &c. The internal parts of the Lock are referred to as remaining unchanged and the advantages of the new revolving dial pointed out.

The excellent illustration of Stanley's Roofing Brackets, on the inside page of our cover, will show how these articles can be utilized for campaign purposes—sitting out on the roof to see the procession, &c.—but they will interest mechanics more

for their permanent uses in providing a secure and rapid means of placing stagings, for shingling or painting roofs.

Merrie, Verhage & Co., 11 West Seventh street, Cincinnati, Ohio, favor us with their handsome illustrated catalogue and price list of Plumbing, Steam and Gas Goods. The catalogue is a substantial and well-gotten up cloth-bound book some 11 x 7 inches in size, and contains over 300 pages. Running over it, we notice that the first 80 pages are filled with illustrations, general and sectional, of an extensive variety of Stops, Cocks and Bibs. The engravings are well executed, and accompanying the illustrations are lists giving prices of the different sizes. Miscellaneous Fittings, Couplings, Ferrules, &c., are next taken up, after which considerable space is devoted to Bathtubs, Range Boilers, Sinks, Washtubs, Urinals, Washstands, Water-Closets and Supply-Cisterns. A number of pages are devoted to Lift and Force Pumps, with their various attachments, and lists are given of a variety of sizes of Steam Radiators, the Eclipse Radiator occupying a prominent part. Some 50 pages are filled with illustrations and list of Iron Fittings, followed by an extensive variety of Valves, including several Steam Goods Specialties. The volume closes with Plumbers' Furnaces, Gas Pliers, Pipe-Cutters, Vises and other steam-fitters' tools. Reference to the contents of the volume is facilitated by a complete alphabetical index in the front of the book. The catalogue, which has just been issued from the press, is found of great service to plumbers, steam fitters and all who are interested in similar work.

Trade-Mark Decision.

The following extract is from the decision of Judge Holmes granting an injunction against the Le Page Glue and Cement Company, to which reference was made in our last issue. An injunction was ordered:

Restraining the defendant from the use of the words "Le Page's Glue" or "W. N. Le Page's Glue" on parcels or bottles or cans of Liquid Glue, or from using the name of the defendant corporation on parcels or bottles or cans of Liquid Glue, or from advertising in the name of the defendant corporation as manufacturing or selling Liquid Glue (but without prejudice to the right of said corporation to buy or sell Liquid Glue or make out bills therefor in its own name) or from in any manner representing, or causing or procuring to be represented, that the defendant corporation has been or is carrying on the business formerly carried on by Rueben Brooks and W. N. Le Page as copartners, or by the Russia Cement Company, or is the successor in business of either the said copartnership or the said company, or that the goods manufactured by the defendant company are the goods of the said Brooks and Le Page copartners, or of the Russia Cement Company, without prejudice to the right of the defendant to use certain new labels of which samples have been exhibited to the court and counsel for the complainant and are to be filed in the case.

The new labels state the fact that the Le Page Company are the manufacturers of the Glue to which the labels are applied, but do not designate it as Le Page's Glue, that being the name by which the Russia Cement Company's article has been known and to which the Court decides they have the exclusive right.

Exports.

We give below abstracts from recent manifests showing the exports in Hardware and related lines which have recently been made to Australia and South Africa:

PER BARK GEFION, SEPTEMBER 21, FOR PORT ELIZABETH, AFRICA.

By W. H. Crossman & Bro.—40 dozen Handles, 1 case Hardware, 1800 pounds Sash Weights, 52 pounds Cord, 90 dozen Axes, 158 dozen Hatchets, 12 dozen Hammers, 30 dozen Shovels, 5½ dozen Sledges, 4 dozen Picks, 3 dozen Meat Cutters, 25 Scales, 2 packages

Pumps, 119 cases Plow parts, 102 dozen Hatchets, 5783 pounds Sisal Rope.

By Strong & Trowbridge.—1500 Handles, 30 cases Clothes Pins.

By H. W. Peabody & Co.—20 cases Agricultural Implements.

By Knauth, Nachod & Kuhne.—3 cases Plow Castings, 50 pairs Plow Handles.

By Corner Bros. & Co.—8 dozen Tools, 22 cases Agricultural Implements.

By Coombs, Crosby & Eddy.—16 Plows, 6 Corn Shellers.

By J. Norton & Sons.—3600 pairs Staves, 1 Carriage, 12 dozen Slates, 124½ dozen Cocks, 5 cases Castings.

By Arkell & Douglas.—88 pounds Sash Cord, 1500 pounds Agricultural Implements, 66 pounds Sash Cord, 4 dozen Lifts, 100 pounds Sash Cord, 35 pounds Sash Cord, 2½ dozen Blocks, 16 Picks, 4 dozen Axes, 1 dozen Pulleys, 30 dozen Brooms, 600 feet Hose, ½ gross Fruit Jars, 3 dozen Scales, 20 Pumps, 32 dozen Handles, 9 dozen Lampware, ½ dozen Oil Stoves, 1 dozen Traps, 1 Lawn Mower, 1 dozen Traps, ½ dozen Bows, 8 Agricultural Implements, 6 dozen Saws, 4000 Cartridges, 167 pounds Hardware, ½ dozen Barrows, 6 gross Screw Nails, 2 dozen Locks, 5 pounds Oil Stoves, 3½ dozen Lampware, 2 dozen Traps, 128 pounds Sandpaper, 1½ gross Fruit Jars, 1 dozen Faucets, 1½ dozen Saws, ½ dozen Meat Choppers, 8 dozen Picks, 1½ dozen Braces, ½ dozen Sausage Stuffers, 40 Agricultural Implements, 1-6 dozen Pumps, 25 dozen Brooms, 1 dozen Perambulators, 20 dozen Shovels, 20 dozen Axes, 1½ dozen Sausage Stuffers, 2755 pounds Agricultural Implements, 1-6 dozen Pumps, 60 dozen Axes, 2 dozen Wagons, 24 dozen Washboards, 24 dozen Axes, 16 dozen Hatchets, 80 kegs Nails, 60 dozen Handles, 10 dozen Picks, 16 dozen Racks, 200 Agricultural Implements, 14 cases Sash Weights.

PER BARK SULITELMA, SEPTEMBER 15, FOR SYDNEY, N. S. W.

By Arnold, Cheney & Co.—6 crates Washboards, 3 cases Axes, 1 case Hoes, 2 cases Wagons, 5 cases Hardware, 1 case Wheels, 4 cases Wheels, 103 cases handles, 1 case Wicks, 18 cases Carriageware, 3 cases Shovels, 3574 pounds Paint, 7 cases Wagons, 2 cases Brooms, 4 cases Axes, 29,000 pieces Roofing Slate, 12 cases Varnish, 6 cases Wheels, 4 cases Polish, 3 cases Saddlery, 1 Barrel Bells, 1 case Saddlery, 2 cases Blacking, 1 box Hardware, 4 Boxes Horse-Shoe Nails, 4 cases Brooms.

By Hsley, Doubleday & Co.—15 gross Axle Grease, 6720 pounds Axle Grease, 10 gross Glass Cutters, 1½ gross Metal Toys, 20½ dozen Horse Brushes, 15 gross Axle Grease, 264 pounds Paints.

By R. W. Forbes & Son.—98 sets Harness, 24 cases Wagons, complete, 23 packages Hardware, 4 cases Plated Ware, 2 cases Letter Files, 15 Scales, 3 dozen Scales, 4 cases Agricultural implements, 1 dozen Oil Gates, 6 Horse Hoes, complete, 4 cases Fire Arms, 16 packages Agricultural implements, 49 cases Sewing Machines, 1 dozen Forks, 6 crates Machinery, 65,900 pieces Roofing Slate, 7 casks Glue.

By F. B. Wheeler & Co.—50 gross Wicks, 3 Organs, 66 sets Harness, 2 cases Hardware, 6 crates Woodware, 21 packages Stoves and Parts, 2 packages Plated Ware, 13 cases Clocks, 1 case Clocks, 26 dozen Whips, 84 dozen Handles, 100 boxes Clothes Pins.

By R. W. Cameron & Co.—200 pounds Brushes, 574 pieces Hardware, 40 crates Blacking, 1 case Machinery, 26 boxes Steel.

By Coombs, Crosby & Eddy.—49 dozen Saws, 6 dozen Lemon Squeezers, 3 dozen Wringers, 3 gross Woodware, 63 Pails, 1350 pounds Slate, 1 gross Graters, 24 dozen House-Furnishing Goods.

By Strong & Trowbridge.—5 cases Hardware, 1 case Forks, 1 case Miter Boxes, 4 cases Picks and Axes, 1 case Hammers, 1 case planes, 20 gross Guns, Tools and Cartridges, 1 box Hardware, 3 packages Corn Shellers.

By H. W. Peabody & Co.—5105 pounds Wire Rope, 10,039 pounds Fence Wire, 1 case Machinery, 47 Sewing Machines.

By Mosbacher & Co.—1100 pounds Shears.

By A. Field & Co.—2 gross Shade Rollers, 42 Stoves.

By Winchester Repeating Arms Company.—10 Guns, 40 sets Tools, 100,000 Primers, 3000 Shells, 84,000 Cartridges.

By W. R. Freeman.—1290 pounds Files and Saws, 4852 pounds Axes, 16 cases Axes.

By A. S. Lascelles & Co.—8 gross Mouse Traps, 2 gross Hardware, ½ dozen Brooms, 30 dozen Axes.

By Healy & Earl.—1 case Saws, 1 case Hardware, 3 cases Saw Mills, 1 case Planing Machines, 7 cases Woodworking Machinery.

By P. D. Ackerman & Bro.—300 pounds Plated Ware.

By Peters & Calhoun Company.—4 cases Saddlery.

By H. A. Rogers.—3 boxes Woodworking Machinery.
 By J. A. Ten Eyck.—6 cases Wagon Springs.
 By Rogers, Smith & Co.—7 packages Plated Ware.
 By Meriden Britannia Company.—5 packages Plated Ware.
 By Ansonia Clock Company.—43 boxes Clocks.
 By E. N. Welch Mfg. Company.—45 boxes Clocks.
 By Barber & Co.—2220 pounds Castings.
 By J. Mathews.—250 pounds Nails, 808 pounds Hoop Iron.
 By Crane & McMahon.—8 packages Carriage Ware.
 By Reed & Barton.—26 packages Plated Ware.
 By V. Basanta.—60 dozen Handles, 21 dozen Hoes, 33 dozen Axes, 24 Corn Shellers, 48 Stepladders, 24 Lawn Mowers, 200 Lamp Goods, 42 Velocipedes, 5 dozen Clocks, 700 dozen Handles, 80 Velocipedes, 5½ gross Fruit Jars.
 By McLean Bros. & Rigg.—54 dozen Handles, 2 gross Vegetable Presses, 12 dozen Hammers, 3 dozen Roasters, 3 Churns, 41 Pistols, 30 dozen Rat Traps, 12 dozen Handles, 1 case Hardware, 4½ dozen Hammers, 81 dozen Wire Goods, 3 Rope Reels, 139 dozen Granite Ware, 6 dozen Saws, 1 dozen Fluters, 102 dozen Chimneys, 33 dozen Padlocks, 23 dozen Cow Bells, 4 cases Sporting Goods, 1½ dozen Well Wheels, 6 crates Bats, 50 dozen Illuminators, 123 dozen Hardware, 400 dozen Handles, 4½ dozen Braces, 18 sets Wheels.
 By Arkell & Douglas.—2 dozen Jacks, 141 Axes, 5 dozen sets Axes, 13 dozen Horse Collars, 2 dozen Bench Screws, 17 dozen Hammers, 4 dozen Saws, 975 pounds Hardware, 3 dozen Lanterns, 30 dozen Guns, 45,000 Cartridges, 52 dozen Hatchets, 30 dozen Axes, 8 dozen Picks, 3 dozen Braces, 12 gross Whips, 40 dozen Shovels, 3 dozen Traps, 40 dozen Hammers, 2168 pounds Locks, 5 dozen Axes, 10 dozen Picks, 3 dozen Wrenches, 4 dozen Sad Irons, 254 dozen Handles, 2 dozen Braces, 12 dozen Shovels, 6 dozen Ranges, 4 dozen Stencils, ½ dozen Lawn Mowers, 17 dozen Latches, 22 dozen Wrenches, 315 dozen Lampware, 12 gross Chisel Handles, 71 sets Double Trees, 11 cases Carriage Ware.
 By W. H. Crossman & Bro.—24 dozen Axes, 20 dozen Hatchets, 1 barrel Carpenters' Tools, 3 gross Shade Rollers, 1 dozen Air Guns, 1 dozen Sausage Stuffers, 3 gross Machine Oil, 1 dozen Corn Mills, 17 cases Hardware, 1 case Tools, 213 dozen Handles, 20 dozen Paint Brushes, 2 cases Hardware, 2 cases Tools, 2 gross Pencils, 1 case Sleeve Supporters and Carpenters' Tools, 10 gross Machine Oil, 5 dozen Wrenches, 3 dozen Axes, 40 dozen Hatchets, 7 packages Hardware, 1 dozen Meat Choppers, 2 cases Hardware, 4 packages Tools, 1 dozen Air Guns, 2 dozen Carpet Sweepers, 2 gross Egg Beaters, 48 dozen Axes, 12 dozen Hatchets, 4 bundles Barrow Parts, 1 case Hardware, 2 gross Wood Spoons, 4 dozen Pails, ½ dozen Bowls, ½ dozen Guns, 3000 Cartridges, 1 case Carriage Drills, 7 cases Hardware, 3 gross Axle Grease, 1 case Tools, 1 case Hardware, 68 dozen Hatchets, 12 dozen Picks, 146 dozen Handles, 103 dozen Mouse Traps, 2 cases Tools, 1 case Hardware, 12 dozen Axes, 10 gross Machine Oil, 1 Lawn Mower, 2 cases Hardware, 1 case Tools, 147 pairs Roller Skates.

Nason Mfg. Company,

71 Beekman street, New York, have issued, under date September 25, a discount sheet referring to their catalogue, April, 1886, with subsequent revisions. It thus gives prices on a large variety of goods in their line. The prices named on some of the leading goods are as follows:

	Dis. per cent.
Lap Welded American Charcoal Iron Boiler Tubes.....	50
Wrought-Iron Pipe:	
On List prices as revised 23d March, 1887:	
Plain 1¼ inch and under, whole lengths.....	55
1½ in. and over.....	65
Galvanized, 1¼ in. and under, whole lengths.....	47½
Galvanized, 1½ in. and over, whole lengths.....	55
When cut to order, advance 5% on discount, and labor cutting charged extra.	
Extra and Double Extra Heavy W. I. Pipe:	
Plain 1¼ in. and under, whole lengths.....	50
1½ in. and over.....	60
When cut to order, advance 10% on discount, and cutting extra.	
Iron Hydraulic Pipe.....	Net
Heavy Drive Well Pump.....	Net
Light Galvanized Leader Pipe.....	50
Galvanized Adjustable Elbows.....	10
Spiral Riveted Pressure Pipe.....	50
Fittings for Spiral Riveted Pipe.....	20
Cast-Iron Drain, Water and Smoke Pipe.....	60
Cast-Iron Water and Gas Pipe.....	Market rates.
Lead Pipe, 6¼ cents per pound.....	Net
Cast-Iron Fittings.....	70
Bushings and Plugs.....	75&10
Cast-Iron Flanges.....	70

Branch Tees, Hook and Expansion Plates.....	67½
Malleable-Iron Rushings.....	75&10
Malleable-Iron Unions.....	67½
American Unions.....	45
Wrought-Iron Fittings:	
Quarter Bonds and Long Screws.....	67½
W. I. Couplings and Nipples, List Prices Revised on 20th January, 1887.....	67½
Cook Wrenches.....	60
Gas-Pipe Hooks, Wrought Iron.....	Net
Ceiling and Floor Plates.....	67½
Blake's Adjustable Pipe Hangers.....	30
Malleable-Iron Fittings.....	25
Iron Stop Cocks, 65&10%, with brass plugs.....	60&10
Foot Valves and Strainers:	
Iron Foot Valves and Strainers.....	65&10
Nason's Foot Valves and Strainers.....	60
Mushroom Strainers.....	25
Expansion Joints, Iron Body.....	65
Iron Body Valves, Brass Mounted:	
Standard Pattern.....	65&10
Heavy.....	50
Brass Valves, Cocks, &c.:	
Valves, Standard Pattern.....	60&10
Heavy.....	50
Steam Cocks, Standard.....	57½&10
Heavy Pattern.....	50&10
Expansion Joints, Heavy Pattern.....	50
Air Cocks.....	60&10
Cylinder Cocks.....	50&10
Gauge Cocks.....	55&10
Gas Cocks and Soldering Fittings.....	57½&10
Quick Opening Elevator Valves.....	50
Water Gauges.....	60&10
Nason's Improved Water Columns.....	15
Steam Gauge Cocks.....	55&10
Radiator Valves and Cocks:	
Radiator Angle Valves.....	60&10
Air Cocks.....	60&10
Jenkins' Radiator Angle Valves.....	60
Radiator Angle Valves with Spindle.....	60
Automatic Air Valves for Radiators:	
Breckenridge's patent.....	30
Davis'.....	25
Oil Cups.....	60&10
Lubricators.....	60&10
Steam Whistles.....	60&10
Single Bell Chime Whistles.....	10
Chime Steam Whistles.....	40
Whistle Valves.....	60
Brass Fittings.....	60&10
Brass Bushings.....	60&10
Steam Bibbs and Stops.....	50&10
Steam Swing Joints.....	50&10
Swinging Check Valves:	
Improved Pattern.....	35
Van Wies'.....	35
Patent Straightway Gate Valves:	
Haydenville Double Gate Valves.....	40
Ludlow Sliding Stop Valves.....	35
Peet Sliding Gate Valves.....	40
Jenkins' Straightway Gate Valves.....	35
Kennedy's Double Gate Valves.....	55
Eddy's.....	25
Chapman's Gate Valves.....	35
Jenkins' Globe and Angle Valves.....	60
Check Valves.....	60
Benton's Lubricators.....	60
Handy Drop Feed Lubricators.....	20
Nathan's Self-Acting Lubricators.....	20

J. F. Wollensak's Sample Case.

J. F. Wollensak, manufacturer of Locksmiths' and other Hardware specialties, 225 to 229 Lake street, Chicago, has invented

Fig. 1.—J. F. Wollensak's Sample Case.

a sample case of striking merit, which he uses for displaying samples of Keys, but which is well adapted for a variety of other goods. Two illustrations of this case are presented herewith. One shows the case complete, with the lid partly

Fig. 2.—Detail of Sample Case.

open. The other shows one of the pulleys or rolls on which the samples are fastened. The pulleys, of which six are thus used, are made of cast iron, with the rim incased in wood. Billiard cloth is fastened on the face of the pulley to form a background for the samples, which are secured in their places by small staples. Space is left under each row of samples for price tags. The pulleys used in this case are 20 inches in diameter, outside measurement, with a face 6 inches wide. They revolve on the shaft independently, screw-eyes being inserted at frequent intervals on their face to take hold of when turning

were dealers on the subject, both through the columns of *The Metal Worker* and by direct correspondence.

The Cipher Competition.

Since publishing the solutions to the cipher problem presented in *The Iron Age* of August 30 we have received the following from a correspondent at Greenville, Miss. The date of his letter is sufficient evidence that he had not seen the previous solutions, so we take pleasure in presenting his method of solving the enigma.

In *The Iron Age* of recent date I find a cipher problem for which solutions are invited: 6ol = akl; hence l must be 2, 4, 6 or 8. 6r = lt; hence l must be less than 6. If r is 4 the product would be lr. Hence l must be 4, and the only other number that will make a product ending with l (4) is s or 9. Hence we get l = 4; r = 7; t = 2 and s = 9. The remainder of the problem is worked out as follows:

$r \times 6 = lt$
 $7 \times 6 = 42$
 $s \times 6 = wt$
 $9 \times 6 = 54$
 $w \times 6 = am$
 $5 \times 6 = 30$
 $a \times 6 = ek$
 $3 \times 6 = 18$
 $tae \times 6 = eako$
 $231 \times 6 = 1386$
METAL WORKS
 0 1 2 3 4 5 6 7 8 9

After working out the above problem, on looking behind me on one of the boxes I saw the words I use written out in the following cipher. Perhaps some of your readers might wish to solve it:

	Each.	$\frac{1}{2}$ doz.

" No. 41P.....	ts.....bin	
" No. 472I.....	nh.....anc	
" No. 934I.....	cb.....isc	
" No. 841S.....	hci.....cht	

Equalization of Stove Prices.

With stoves manufactured in as many different parts of the country as at present, and with a very large consumptive demand at points remote from the foundries, the need of branch houses located at prominent distributive points becomes very apparent. When, for example, a half dozen foundries have established warehouses and their managing representatives at a certain point, there is nothing more natural nor anything more advantageous to all concerned than a general understanding about prices. Otherwise indiscriminate cutting would soon prevail, and profits would rapidly disappear. With a friendly understanding established in this way things are very likely to run along smoothly until some untoward event disturbs the harmony. If, for further example, one of the foundries with aggressive enterprise pushes out a new branch, say 500 miles or more toward the great consuming territory of the country, and begins to supply stoves from that point at the same rates as are made at home or at the distributing center where the original branch houses were located, the other concerns are at once placed at a disadvantage, and soon see that something must be done in order to hold their trade. The result of such circumstances, as we have briefly outlined, are sometimes most disastrous. In other cases they are happily managed in a way to save great loss.

The situation in the West at the present time is very inadequately typified by the hypothetical instance above cited, but the little flurry in prices on certain lines of stoves which has caused the managers of branch houses in Chicago some uneasiness of late has for its cause circumstances in some particulars comparable with those we have described. Agreements to equalize prices, by which a concern situated near the consumer shall have no advantage,

in this one item at least, over those further away, stand at best on an uncertain foundation, and there is ever present the temptation to break them. Sharp competition and the natural jealousies of men in the same trade make it almost impossible for rival houses to govern themselves by agreements which in however slight a degree reduce their opportunities for trade to a point below that to which their geographical location would seem to entitle them. When a break occurs, however small it may be at first, the tendency is toward a stampede, and a stampede once instituted, irrespective of whom the original guilty party may be, it is very difficult to stop. If differences which have been troubling the Chicago houses and other Western concerns the past few weeks have been permanently and satisfactorily adjusted, and if the danger of a break in prices at the commencement of what promises to be an active season's trade has been averted, the stove industry at large is to be congratulated. The first reports that reached us were alarming in character, but later advices are reassuring, although it is still evident that there are some houses that are disposed to pursue their own course and to act independently of the others.

Agreements to equalize prices are not the only contracts which in the heat of competition it is convenient to break or modify to suit circumstances. The buyer of stoves watches the game with great interest and with entire willingness to take a hand in it whenever it may be to his advantage to do so. With freights to a given point conceded, he next turns his attention to a special discount for cash, or to an allowance for some other reason; or he tries to get invoices dated ahead as a concession for a liberal order to an over-anxious stove salesman. In one way or another he frequently manages to buy stoves below the market price. The different concessions, allowances and rebates which stove manufacturers are thus called upon to face at the present time are most serious in character, and promise to work great injury if not speedily stopped. What the remedy is, beyond fair trading and a decent respect for one's competitors, we shall not attempt to point out. We simply direct attention to these things because they are so frequently mentioned in our correspondence of late, and because they are uppermost in the mind of every managing stoveman.

The stove manufacturers of the entire country, and particularly those who find their largest market in the West, have before them, we believe, a season of large demand. The fall and winter at present promise well, and all that is needed to make it satisfactory in final results is healing the breaches that exist—in other words, closing up the ranks and standing shoulder to shoulder. Reports from the entire country continue to be favorable, and nothing, therefore, can be more foolish or disastrous at this time than a disagreement between leading concerns, or a competitive struggle for trade, that shall result in the demoralization of prices. Retailers are interested in the stability of prices to almost as great an extent as the manufacturer, and, therefore, the welfare of all is to be served by careful and conservative action.

Why Stove Orders are Tardy.

It is generally conceded that the prospects in the stove trade at the present time are excellent, and yet we hear numerous complaints that orders are slow in coming in, and that, instead of experiencing the brisk trade at this season that is usual, some warehouses are comparatively dull. In view of the fact that the crops are good, business interests are prosperous, and that there is a very large demand to be supplied this fall, the question naturally arises: Why are stove orders tardy? The answer

is readily found, and is, in brief, the excellent shipping facilities which are at present enjoyed in almost every part of the land. The improved transportation enjoyed by the West has affected trade in Chicago, perhaps, more than at any other point. Orders are delayed simply because goods when bought can be shipped in short time. During the past week or ten days a considerable number of visitors have been in Chicago, and their presence has to some extent revived the recollections of former years when Chicago salesrooms were fairly thronged at certain seasons of the year by customers from distant localities. There is, however, less occasion for customers to visit Chicago at the present time than formerly, because the enterprise of manufacturers causes their travelers to call upon customers; while, on the other hand, the action of the Interstate Commerce law, which has tended to diminish the number of passes, has made it more expensive for dealers to visit the city. But, as already stated, the great increase in commercial facilities probably has much to do in influencing many dealers to withhold orders for stocks of stoves. They know that within a very short time from the receipt of an order the manufacturers will have their stoves on the way, and that they will be promptly delivered, whether the season be winter or summer. Railroads now reach almost every town of any importance in the Northwest, and many towns are served by two or more lines, between which there is great rivalry for business. Because of this rivalry the time for delivering goods by freight has been greatly shortened. Stoves can now be delivered in St. Paul in two days' time from Chicago, instead of a week as formerly. Denver is reached in four days, instead of two weeks. Shipments even to Los Angeles, Cal., are guaranteed in eight days, against the former time of a month.

The Bee Hive Bank.

Wm. Mitchell Gobeille, who is located at the corner of Monroe and Penn streets, Cleveland Ohio, has brought out an attractive addition to the general line of toy

Bee Hive Bank.

banks which are at present before the public. It may be described as the Bee Hive Bank, and is very satisfactorily represented by the accompanying engraving. The ornamentation makes it resemble an old-fashioned straw beehive. The base measures 6 inches square, and the height is also 6 inches. The corners of the base are inscribed with the words, "Industry," "Honesty," "Economy" and "Temperance." The slot is adapted to receive anything from a silver dollar to the smallest coin. It is provided on the inside with a rubber piece, which prevents the coins from being rattled out. The bottom of the bank underneath the base is provided with a lock and key. By releasing the lock an opening is revealed in the base through which the savings may be withdrawn.

Duplex Pencil Pointer.

Kolesch & Co., 155 Fulton street, New York, are putting on the market a pencil pointer, designed especially for draftsmen's and artists' use, which is illustrated in the accompanying cut. It is intended for sharpening the lead of a pencil to a very fine point, either round or knife edged. It is made of brass, handsomely nickel-

The Duplex Pencil Pointer.

plated, so arranged as to hold a piece of fine emery cloth in the position shown in the cut. This gives the abrading surfaces by means of which the pencil is pointed. The substitution of a new piece of emery cloth is easily accomplished, as the inside holder can be pushed out, when a new sheet can be readily inserted. The illustration represents the use of the pointer in giving a round point to a pencil, but if a flat edge is desired it is explained that the point may be pressed lightly in the groove of the sharpener and drawn lengthwise from end to end. The sharpener retails for 25 cents.

The Perfection Curling Iron and Heater.

The illustration given below represents this article, which is put on the market by the Perfection Mfg. Company, Rochester, N. Y., for whom it is made by Yawman & Erbe, of that city. The heater, which is 3½ inches long, is made of brass and nickel-plated. It is filled with cotton to prevent the spilling of the alcohol. The wick-holder is easily removable, so as to permit the convenient filling of the heater. The arms on which the curling iron rests while being heated, as shown in the cut, after the lid has been shut down, fold compactly, so as to make the heater occupy

The Perfection Curling Iron and Heater.

very little space. The form of the curling iron, which is 7 inches in length, is shown in the engraving. The points made by the manufacturers in regard to this neat and simple contrivance are—that there is no odor or smoke connected with its use, and that the iron will not soil the hands; that it can be carried in the pocket; that it gives an intense heat, heating the iron, it is claimed, in half a minute, and that it is

inexpensive. The heater and the iron are put up in a neat box, and it is anticipated that it will meet a want of the trade.

Labor-Saving Dust Pan.

The Cline Mfg. Company, 70 and 72 West Washington street, Chicago, are manufacturing a dust-pan of new design.

It is made of tin, neatly japanned, and is intended to lie flat on the floor, where it is held in position by the operator's foot, as shown in the accompanying cut. A projection extends beyond the point of the pan for this purpose, and it also has a hole

Labor-Saving Dust Pan.

punched in it by which the pan can be hung up. The pressure of the foot causes the edge of the pan to stick close to the floor so that none of the sweepings can pass under it. As the pan is not held by the hand, bending over is unnecessary. A handle is attached on the top of the pan so that it can be held by the hand when used as a crumb-pan. A patent has been applied for.

The Crown Picture Hanger.

The illustrations given below represent a new picture hanger, which is put on the market by the Brinkerhoff Company, Auburn, N. Y., of which a full description is given in their very complete catalogue, which is devoted to an exhibition of the

different styles and patterns which they are making. This hanger is intended to furnish something for the purpose of hanging pictures more artistic than the goods which are now generally in use, while

Fig. 1.—Crown Picture Hanger.—Wire Before Adjustment.

at the same time it possesses, it will be observed, special features. These hangers are intended to hold the pictures securely, their construction being such as to prevent the moving of the wire on the hook and the falling of the picture to the floor in case the fastening of the wire at one side of the frame should give way. The patent locking construction is a feature of these hangers, on which special emphasis is laid. The hanger is illustrated in the cuts, Fig. 1 showing the wire placed upon the hanger before adjustment, and Fig. 2 showing the wire adjusted in the position required for locking it. These picture hangers are made in different patterns and in a variety of finish. Besides the regular line of single hangers double hangers are also made which furnish means for suspending a picture from any desired point, even though the ends of the molding should meet at the point where it is desired to hang the picture. In these double hangers between the engaging hooks is an

Fig. 2.—Crown Picture Hanger.—Wire Adjusted.

extra hanger from which a small picture can be suspended and be free from the supporting wires of the larger picture. Another modification of the same hanger is for use in connection with nails or knobs, in which the nail or the screw by which the knob is fastened passes through a hole in the upper part of the hanger, thus fastening it securely in place, and giving the advantages of the locking device.

Rivet Boxes.

In respect to the rivet box illustrated in Fig. 1, a correspondent writes referring to it as having been found very satisfactory in use: "I would like to submit a box that I made some time since, and which I have been using very satisfactorily for a term of months. I think it is the best box I have ever seen. I send by this mail a model, from which you will understand what I refer to. The box may be made with any number of bins to suit, and can be arranged to hang on the wall or carry in a tool box, and may be of such diameter as the user

Rivet Boxes.—Fig. 1.—A Novel Construction.

prefers. The one that I am using is 5½ inches in diameter and 1½ inches deep, and arranged to hold 4 sizes of rivets; by making the box larger more sizes could be included. There is no trouble about the rivets catching in the sliding top, provided the partitions are brought up to the slide cover. The box referred to has the special advantage of never spilling and mixing the rivets. It is equally serviceable for use for stove bolts."

From the model which our correspondent sends us we have had the accompanying engraving prepared. The box, it will be noticed, is drum-like in shape with one head put on in such a way as to turn by means of a central pivot. This head has a quarter opening through which the rivets may be withdrawn. When one division of the box is open all the others are closed. For the purpose of shutting up the box entirely an auxiliary sliding lid is provided, which shuts over the opening. As mentioned by our correspondent, the box may be carried in a tool box, or it may be hung on the wall. The model that has been sent us is arranged for hanging up.

Another style of rivet box is illustrated below, Fig. 2, concerning which our correspondent says: "Inclosed I hand you a sketch of a rivet box for holding 14 sizes; or it may be used for holding seven sizes of

Fig. 2.—A Useful Rivet Box.

rivets, one-half of each being tinned and the other half black. When using two or more kinds of rivets, a box constructed on this plan is very handy to pick from. It is readily placed in front of the workman on the bench. The usual way of taking a box with one kind of rivets, and then being compelled to go after another box

with a different kind of rivets as the work changes, is very expensive, and by the use of this device is entirely avoided. The box here shown can be made by taking a sheet of tin

saw will be observed, it being fastened readily at any desired point by means of a thumb-nut on the lower side. Besides being used as a saw set, this tool also will serve as a punch, the manner in which the

Avery's Combined Punch and Saw Set.

12 x 14 inches, dividing it the 12-inch way into two pieces, and the 14-inch way in seven pieces for the partitions. Then form the pieces so as to make a tube 14 inches long. Then bend it backward in the middle, thus forming it in the

punch tube is attached to the arm being shown in the illustration. The simplicity of this article and its efficiency and convenience for the purposes for which it is designed are points that are made in regard to it by the manufacturers. Each

New Safety Ash Pan.

shape of half tubes, the adjacent sides of which are connected; next solder on the two ends, the shape of which is clearly shown in the engraving. Afterward insert the partitions, and supply a handle.

tool is fully nickel-plated and is packed in a separate box with directions for use.

Combined Leather Punch and Saw Set.

W. G. Avery Mfg. Company, Cleveland, Ohio, are manufacturing Avery's Com-

New Safety Ash-Pan.

Arthur W. Walker, 31 Union street, Boston, Mass., has recently devised a new safety ash-pan, the general features of which are illustrated in the accompanying engraving. As indicated in the cut, there is a second rim, *b*, inside of the usual top rim, *a*. By raising the handle the inside rim rises about an inch and this prevents the ashes from scattering. When the handle is lowered, after the pan is empty, the rim falls down in position. The motion of the upper rim is limited by wire loops or rivets shown at the ends. The same result may be accomplished by rising flaps, false bottom or other device, by means of which the capacity of the pan is increased by raising the handle. The rims, we are informed, may be of either cast or sheet iron; but if the upper rim, *b*, is of cast iron, the rim *a* may be dispensed with. The appliance is said to be exactly adapted to end hearth ranges.

The largest sorghum sugar mill in the country has commenced manufacturing at Topeka, Kan., and is expected to turn out 1,000,000 pounds of sugar this season and about 150,000 gallons of syrup. Farmers are paid \$2 per ton for the cane, and the product of 1800 acres will be consumed.

Panel Gauge, Trammel and Measuring Rod.

Fig. 1 of the engravings represents a new tool which the Humphrey Tool Company, of Warren, Mass., are putting upon the market. It is known as Humphrey's Panel Gauge, and combines with this function a trammel and measuring rod.

Fig. 1.—Panel Gauge, Trammel and Measuring Rod.

The tool is designed for wood-workers where the work is too wide for the common gauge. It consists of three sections, adapted to telescope together, as shown in the engraving, which represents the tool as partly extended. The sections are held at any length required by the thumb nuts which terminate the different parts, and which are arranged to clamp one part against the other. A smaller nut is pro-

Fig. 2.—End View of Trammel Gauge.

vided on the end, which is useful for fine adjustments. A pencil may be passed through the head, and the tool in this form can be used as a trammel. Or the head may be removed, and the bar used as a measuring-rod, being in this form of sufficient length to measure a common window or door. The second engraving, Fig. 2, shows a view of the device end

at best was unhandy, not only in use but to take care of when not in use. The compact form in which this tool can be placed when out of use is in itself a great advantage. The tooth is extended on the top side, so as to be used as a point or pivot on which to swing when a pencil is passed through the head, converting the tool into a trammel. Each end of the rod

is furnished with a point to facilitate the use of the device as a measuring-rod. By this means the points of contact, as for example for measuring a door or other opening, are reduced to the smallest possible surface.

The Kizer Hammer.

The Kizer Hammer Company, Washington, D. C., for whom Danforth & Pike, 114 Washington street, Boston, Mass., are agents, are introducing to the trade a new hammer called the "Kizer," which is represented in the accompanying illustration. It will be seen that this hammer differs from a regular nail hammer in the construction of the claw, which has a new device for drawing nails and terminates in a blade. The nail is drawn by means of a slot in the side, which bites or grips the nail at the point of contact. It is pointed out that the grip being transverse to the slot instead of parallel to it, as in other hammers, it is much stronger and the nail is drawn with certainty. It is claimed that wire nails, which are coming into such general use and are drawn with so much difficulty with the regular hammers, are drawn readily with this hammer, which from its construction is referred to a

The Kizer Hammer.

on, so to speak, and indicates the nature of the head and also of the right-angled groove in the head, shown in profile in the previous engraving, by which the gauge is operated. The model before us is well made, the parts being carefully fitted and the workmanship excellent. The sections of the rod are plated, and the head japanned. This tool takes the place of a common gauge where the work is too wide for it. The old way was to use a bar of wood or a strip of metal, according to circumstances, which

adapted to drawing a headless nail as well as one with a head. Its utility in drawing screws, the heads of which are broken off, is also alluded to, and it is claimed that if the screw projects sufficiently to permit the hammer to grip it it can be withdrawn. In the repairing of houses and frequently in the construction of new buildings it is desirable to remove the trimmings, such as moldings, &c., and to take the nails therefrom is difficult, as they cannot be driven through the face without damaging the molding, so that it is necessary frequently

to cut off the nails. It is claimed that this trouble is avoided by using the Kizer hammer, as the head can be drawn through from the back. The blade of the hammer is described as finely tempered and given an edge, as shown, so that it may be used as a box scraper, for cutting hoops, beveling the edges of boxes preparatory to hooping them, and other uses, as an adze or draw knife, while it can also be used as a small vise for filing bolts, &c. The Kizer hammer is stated to be forged from the best tool steel and is made in two styles, the plain and the bell face, and the manufacturers guarantee to replace every hammer which is broken in legitimate use.

Fox-Tail Plumes.

The Chapman Mfg. Company., Meriden, Conn., have been making additions to their line of plumes for sleighs, one of

Fox-Tail Plumes.

which is represented in the accompanying illustration, which is referred to as one of the latest novelties in sleigh decoration. The plumes are used, as our readers will understand, on the dash of fine turnouts, and are furnished gray, red or black. Similar plumes are also made in several other styles besides that illustrated in the cut.

A Large Steel Casting.—Reports of large steel castings come up from time to time. Among those of which we have lately heard is one made at the Homestead works of Carnegie, Phipps & Co., Pittsburgh, Pa. It was for the 42-inch cylinder of the 3000-ton shear in the slabbing mill. It weighed 54,600 pounds, and is a reserve casting for the tool in question. The same company have made a number of castings weighing 40,000 pounds and over.

CURRENT HARDWARE PRICES.

OCTOBER 3, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

THE IRON AGE

THURSDAY, OCTOBER 11, 1888.

New Emery Grinders.

We illustrate on this page two new emery grinders built by the Norton Emery Wheel Company, of Worcester, Mass., the nature of the design being well shown and requiring little description. The machines

heavy, and this point has not been forgotten. Fig. 1 represents a 2-inch grinder, the distance between the wheels being 40 inches and the entire length of spindle 55 inches. The bearings are 12 inches long and the height from floor to the center of the spindle is 29½ inches. The spindle, for

ing countershaft, is only 180 pounds. Both machines will work equally well wet or dry.

Experiments in submarine telephony have been made by the French Government at Brest. The instrument is called a hydro-

NEW EMERY GRINDING MACHINERY, BUILT BY THE NORTON EMERY WHEEL CO., WORCESTER, MASS.

are furnished with self-oiling boxes, which keep the bearings supplied with oil for a long time without refilling, and they are so arranged as to prevent dust from entering the journals. It will be noticed that the bearings are of extra length and that unusual distance is given between wheels. It is a well-known fact that the machinery for this purpose should be strong, firm and

slow speed, runs at 925 revolutions per minute, and of quick speed, at 1350. The weight of the machine complete is 1000 pounds. Fig. 2 shows a 1-inch bench grinder running at 1600 and 2250 turns per minute for slow and quick speed work respectively. The wheels here are 21¼ inches apart and the entire length of the spindle is 29 inches. The weight, includ-

ing countershaft, is only 180 pounds. Both machines will work equally well wet or dry. Experiments in submarine telephony have been made by the French Government at Brest. The instrument is called a hydro-

Minnesota Iron Ores.—II.

BY JOHN BIRKINBINE, PHILADELPHIA, PA.

The Tower Mine.

Two hundred feet is the present working depth of part of the Tower mines, but a shaft is sunk 70 feet further, from which drifts are being run so as to keep several years' work in sight. The large open pits are still operated, but all new work is underground. The policy which General Superintendent Bacon has adopted, of keeping so far in advance of actual mining, has somewhat increased the proportion of lean ores; but even this "Red Lake" ore, yielding 62 to 65 per cent. of iron, cannot be considered lean. The "Minnesota Bessemer" ore is fully up to the high standard of excellence adopted by the company. The season's average being reported as "67 per cent. strong." The complimentary names assigned to the various openings have given place to the shorter system of numbers, for diamond drill explorations indicate that the ore lenses overlap each other, and new openings will probably soon be necessary.

A most interesting study of the peculiarities of the occurrence of red hematite ore is found in the western end of the Ely pit, where over one-half of the ore body was cut out by a nearly perpendicular face of jasper, but deeper down the ore penetrated into the horse, and at a greater depth the ore-lense apparently divides and passes on either side, between the horse and the foot and hanging walls. Viewed from the opening, this horse resembles a nearly vertical pier, standing some distance from the foot wall, carrying an arch, which extends from it to the hanging wall, the arch being nearly a true half circle, seamed so as to closely resemble stone voussoirs. The ore was followed into this arch and gradually pinched out, so that the horse stops short of presenting the appearance of a natural bridge. The almost perpendicular face of the pillar, rising from the present workings over 100 feet to the level from which the surface drift was removed, and the arch which it supports presents a most impressive picture when the miners working at its base emphasize its size. The magnificent proportions of the open quarry, which has heretofore been known as the Tower Pit, make it fully as impressive as any other of our large open iron mines.

The Chandler Mine.

The extension of the Duluth and Iron Range Railroad from Tower north-eastwardly for 21 miles to Ely, has added to the shipping mines the "Chandler," and it is expected to contribute 40,000 tons or more of ore to Minnesota's output of probably 500,000 tons of iron ore in 1888.

While the character of the ore from the Chandler mine resembles that at the Tower mines, its physical condition and occurrence are quite different. The Chandler may be described as a *gravel bank* of hard specular ore, while the Tower mines are quarries of compact masses of hard specular ore. In occurrence the ore in the Chandler mine more nearly resembles some of the Gogebic mines, but the individual pieces are hard ore. As it now appears, the Chandler mine is an open pit, from which about 20 feet of drift has been stripped, and some 20 feet of loosely agglomerated ore is being taken by inclined skip roads. Two shafts, 750 feet apart, are sunk outside of the ore body, from these drifts are run and chutes or raises are being cut to take the ore out of the open pit below the present working level. These shafts are vertical, 82 and 92 feet from the surface, respectively, fitted with cages on which the tram-cars are run. The ore

below the surface drift is very much broken and can be picked and shoveled readily. There is no close selection necessary, for the deposit is practically all clean ore. Cross cuts have shown the body to vary in width; the present workings measure at various cross cuts widths of 40 feet, 33 feet, 70 feet, and 108 feet, the latter being the widest part discovered; at the east end the indications do not promise such great width. While not comparable to the Tower mines, the Chandler is a magnificent deposit of Bessemer ore, the only drawbacks being that it is not held in fee, but is worked under a royalty of 50 cents per ton; and the broken condition of the ore which will make underground operations expensive. It is, however, the opinion of Captain Sellwood and Captain Pengilly that the ore will be harder and more compact as it is followed deeper into the earth. A full equipment of machinery is now being erected, and the owners anticipate that in 1889 the Chandler mine will rank among the large producers. The ore taken from the open workings is designated as "long lake," it carries 60 per cent. and over of iron, and is below the Bessemer limit of phosphorus; the "blue ore" at east end is claimed to average close to 67 per cent. of iron with 0.04 of phosphorus. As lake shipments have just commenced no cargo analyses are obtainable, but the following determinations which have been made will permit of liberal discount on account of selection and still indicate a superior ore.

Analyses of Ore from the Chandler Mine.

Iron.....	66.50	} Personally selected for average of deposit.
Phosphorus.....	0.053	
Silica.....	2.62	

Iron.	Phosphorus.	Silica.	
69.07	0.019	1.40	
67.76	0.036	1.40	
69.00	0.018	0.82	drill core 150 feet deep.
66.79	0.036	4.07	drill core 150 feet deep.
68.73	0.050	1.13	80 feet deep large sampling.
66.23	0.058	2.60	

All analyses are made at 212° F., but the ore carries but little water.

The Chandler mine has large stock piles ready for shipment, some of which have accumulated on account of delays in getting the extension of the railroad from Tower to Ely in operation. The road-bed, which was made during the winter, passed over a "muskeg" or peat bog. When the frost left the bog the embankment disappeared; it was filled up and again sank, until, after repeated efforts, dumping two train loads of roots and timbers and 1500 carloads of gravel into a length of 150 feet of road-bed, a secure bottom was had. On either side of the railroad track are enormous furrows, as if cut by a gigantic plow, which show how the peat has been forced up by the filling settling to a bottom.

While explorations are not so active as a year ago, there is considerable life along the iron ranges, the diamond drill as well as pick, and dynamite being utilized. Some very favorable showings are reported, but outside of the mines now shipping, no others can be mentioned without doing injustice by omissions of some which may exhibit equally good indications. In making this statement, it is well to recall the high standard of excellence which characterizes the district. There is abundance of outcroppings pointing to ore considered lean in Minnesota, which in Pennsylvania, Virginia, Alabama and Tennessee would be ranked as merchantable. The seekers have invariably made Bessemer ore the desideratum, and any deposit which fails to meet the requirements of our steel works has disappointed the explorers. The establishment of industries at the head of Lake Superior will, however, have a tendency to bring some of these less desirable ores in demand.

The blast furnace of the Duluth Iron and Steel Company is sufficiently advanced to insure it going into operation next season, and the establishment of a carworks immediately adjoining the blast furnace will offer a market for considerable foundry iron, which will be supplemented by the requirements of the two foundries in Duluth and those of St. Paul and Minneapolis.

An industry once established at Duluth will expand, and the fact of ores being comparatively lean or carrying phosphorus beyond the Bessemer limit will not condemn them. The pipeworks, for which foundations are being laid in West Superior, Wis., show the faith of those interested in the supply of cheap foundry irons. Whether this company will follow the pipeworks with a blast furnace plant or depend at first upon the iron to be supplied by the Duluth Iron and Steel Company's furnace will be a question only for the initial operation, for other industries will surely follow. The project of a stove foundry at Duluth is now under consideration by some St. Louis parties. The problem of transporting coal to the head of Lake Superior and there coking it will soon be solved by practical tests in the battery of coke ovens constructed near the docks of the Lehigh Coal Company.

We may confidently expect that Minnesota will continue to be an important source of supply for high grade Bessemer iron ores, and also furnish a considerable amount of ores suited for foundry and mill irons. As but one-third of the pig-iron product of 1887 was of Bessemer grade the opportunities for utilizing non-Bessemer ores from Minnesota are encouraging, and the probabilities are favorable for the development of some of the leaner red hematites and the exploitation of some of the magnetites. The presence of titanium in the latter has discouraged operations along the Mesabi range, but there are numerous analyses shown which exhibit little or none of this element. There is no reason to anticipate that the entire range will produce titaniferous magnetites, for in the Lake Champlain district we find titaniferous and non-titaniferous, Bessemer or non-Bessemer magnetites in deposits located close to each other.

Wages in the Pittsburgh Coal Field.

—As was announced in these columns some time since, the wages of the railroad coal miners in Pennsylvania will be advanced 5 cents per ton on November 1, increasing the mining rate to 79 cents a ton, according to the agreement made last April. It was then decided by the operators and miners in joint session that the mining rate should be 74 cents from May 1 to November 1, and from the latter date to May next 79 cents. Some of the operators who were not represented at the joint convention, it is stated, will not pay the advance, and unless an amicable arrangement is made before November 1, it is probable that trouble will ensue, as the miners say they will enforce the advance.

Mahoning Valley Coke Rates.—Some time ago the iron manufacturers and blast-furnace operators of the Mahoning Valley, Ohio, through Robert Bentley, secretary of their organization, presented a petition to the managers of the various railroads asking that the rate on coke from the Connelville region to the valley be reduced from \$1.35 per ton to \$1.25 per ton. An answer has been received, stating that at present the roads were overtaxed, cars were scarce, and they felt that they could not comply with the request. They promised not to advance the rate, and intimated that when business should slacken somewhat they might reconsider their decision.

Rolling Seamless Tubes.

A subject which more recently has attracted a good deal of attention, both in England and Germany, is the rolling of seamless tubes from solid bars or ingots by what is known as the Mannesmann process. At the late meeting of the British Association Mr. Frederick Siemens presented a paper describing it in detail, and from this we take the following, together with the engravings:

The process consists generally in a method of rolling metal into seamless tubes, and it will contribute greatly to increase the use of steel, and principally of those kinds of cheap steel produced by the methods mentioned above. The open-hearth or Siemens steel, above all, possesses the advantage of being cheap, of having the right amount of toughness, homogeneity and other qualities which fit it for the special purpose of rolling solid

pected to arise, as we now have the means of bringing into use the best of material in the lightest and at the same time strongest form.

At the present time, to roll a bar of iron, two horizontal rolls, as shown in Figs. 1 and 2, revolving in opposite directions, are used. If the section of the finished bar is required to be of any given form, grooves are cut around the rolls of the sectional form which the bar is required to assume. Passed longitudinally between the revolving rolls the bar is forced into the grooves and reappears molded to the desired form. The rolls do not make the bar revolve, they act simply on its surface drawing the material forward and forcing it into the prepared grooves, at the same time elongate it and reduce its sectional area. The fiber produced in the finished product is of course longitudinal. Tubes are also made in this way. The prepared sheet of wrought iron is bent till the sides

tube, whereas the latter actually makes the tube, and, in making it, displaces the material of the bar or ingot acted on, and imparts to it a fiber running in a spiral around it. In both systems two or three rolls may be used together, turning in the same direction, and, consequently, imparting a rotating movement in the opposite direction to a bar laid between them. The two or more rolls (Figs. 5 and 6), however, do not lie normally, nor even parallel, but at angles to the axis of each other, and the axis of these rolls cross one another and that of the bar, forming somewhere in space acute angles in opposite directions with each other, and with the bar lying between them. When thus set the rolls act on the bar to draw it forward as well as to make it revolve—or, in other words, they impart to it a spiral movement. Though constructively both systems of mills may appear much the same, they differ widely in their mode of work-

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

Fig. 6.

ROLLING SEAMLESS TUBES BY THE MANNESMANN PROCESS.

ingots direct into tubes. Tubes occupy an important place in the wants of mankind. Besides their use as tubes properly so-called they possess, also, the most advantageous form for columns, rods, axles, bearers, struts, &c. A given quantity of material can be formed into no shape so strong as the tubular.

Hitherto steel tubes could only be made with difficulty and at high cost by a complicated process with imperfectly welded seams and a longitudinal fiber. Now from a rough ingot of cheap steel with one, or, at the most, two operations, a perfect tube without seam and with a circular fiber is produced. It may be seen from this bare statement how great is the importance of this invention. If it is considered that by the process in question tubes of great length and diameter, and of almost any desired thickness of metal, can be produced at a comparatively low cost, airtight and possessing treble or quadruple the resisting power of the best welded tubes of wrought iron, it can hardly be doubted that a great future is opened out for their use in technical arts, industries, architecture, and also in war materials. New branches of industry may also be ex-

overlap and the longitudinal seam thus made is welded while passing through the rolls on a mandrel placed inside. The ordinary patent welded wrought-iron tubes made in this way have also a longitudinal fiber.

Another way (Figs. 3 and 4) of rolling is known and is used for straightening and polishing bars to which a rotating motion is imparted by two or three rolls revolving in the same direction. These rolls are for the most part placed parallel to one another, and the bar to be operated on is introduced in the direction of their longitudinal axis—that is, at the ends instead of at a right angle to the rolls. If such rolls the bar is not drawn forward but simply rotates, and if sufficient pressure is given the bar is elongated, but no decided fiber is produced.

Between the two kinds of rolling described above, which may for convenience be called longitudinal and circular respectively, another system of polishing and straightening bars and tubes occupies a kind of middle position. So also does the Mannesmann tube-rolling process. The systems differ, however; the first acts on the surface only of the bar or finished

ing and in their results. This arises from the position which the article acted upon and which we will continue to call a bar, is made to take up, and the very different action and form of the rolls. In the Mannesmann machine a certain relation is maintained between the forward movement of the bar and its rotating movement, and if the proportion between longitudinal and rotary motion is properly adjusted to the special material acted on, the displacement in the substance of the bar is regulated so that a systematic twist is given to the fiber, by which not only irregular breakage of the material is avoided, but an energetic working action is secured, causing the great strength and toughness the tubes produced by this process are proved to possess.

The old straightening and polishing machine, although outwardly similar to the Mannesmann tube-rolling machine, owing to the form and position of the rolls and bars, admits of no twisting and displacement of material, and, consequently, this machine confines itself to surface action as, indeed, it professes to do by its title. The following remarks may assist in clearing up this singular difference, and explain

the peculiar action of the Mannesmann roll which, while acting on the outer surface of a solid bar, produce a regular hollow space inside the same—in short, a tube. To obtain a simple forward spiral action of the bar, the length of the rolls is immaterial; it will take place when the rolls are reduced to the form of thin disks. Supposing the disks to be infinitely thin, or what is the same thing, that their outer edges are reduced to a mathematical line and no sliding motion takes place, the bar must still move forward spirally, its spiral velocity being equal to the velocity of the outer circumference of the disks. If, instead of one pair of such thin disks, several pairs of disks of regularly increasing diameters are made to revolve on the same axis, the outer circumference of each disk will revolve with greater velocity than that of the preceding one. The same bar is, however, drawn forward through the several pairs of disk, and thus as each part of the bar enters successively a more advanced pair of disks, the velocity with which that portion of the bar rotates increases, and it is drawn forward by each succeeding pair of disks as they catch hold of it with ever-increasing speed.

It will be understood that a bar passing through such a series of disks, no slipping being possible, the material of which it is composed cannot retain its original area or volume. The diameter of the bar being regulated by the disks, while simultaneously a violent stretching action is carried on, the material required can only be drawn from the inside of the bar, and thus a hollow space is formed. Instead of this peculiar arrangement of disks a conical or rather conoidal, pair of rolls, which amount to the same thing as the disks, considered as joined together, may be provided. It follows that a bar or rod of suitable dimensions which is passed through the Mannesmann rolls will, provided its substance is sufficiently homogeneous and plastic, undergo a violent twisting and stretching action, the fiber being spun as is the fiber in a rope on account of which the process may appropriately be called a torsional process. The bar in its passage through the rolls is twisted as thread is twisted in a spinning machine. As, however, it cannot be fed from the outside as is the thread, and as has been said, the diameter cannot be reduced on account of the action of the rolls, it is forced to draw on the interior for a supply of material.

I will attempt to explain in another way. The tube is made thus: A bar is placed between the conoidal rolls at the part where their diameter being least the speed at which they move to make a revolution is also least. The rolls seize the bar and draw it into contact with parts of the cones which move more and more rapidly, though, owing to the way in which the rolls are set, the space left between them for the passage of the bar decreases slightly. Slight, however, as is this decrease in the space between the rolls a certain amount of material has to be shifted. The action of the rolls prevents this material from being taken from the outside of the bar, and consequently it is drawn from the interior—hence the hollow, hence the tube. Soon after entering the rolls a small central fracture is formed, which widens out to a hollow space as the increased stretch is made to take effect in an increased twist acted on from the surface. The increasing twist of the fiber of the bar while passing through the rolls and the peculiar relation kept up between longitudinal and turning action is the characteristic of the Mannesmann tube-rolling machine, and this action it is that enables it to make a tube from a solid bar or ingot. Though the bar is thus converted into a tube by the action of the rolls, and their action only, a mandrel is generally used to finish and smooth the interior and enlarge the tube. This use

of the mandrel has led to the erroneous belief that it is necessary to form the hole in the bar. No machine, however, could stand the strain if it were attempted to force a mandrel longitudinally through a solid bar of hot steel. Such an operation is impossible. Just sufficient power is used to form the hollow in the bar from the action of the rolls on its outside, and into this hollow the mandrel enters, smooths the inside, and, when required, enlarges the tube. Thus we have the strange experience in rolling that, by one operation, the bar is made hollow and also longer and wider than when it entered the rolls a few seconds before. In a specimen placed before you is the proof that the hollow in the interior of the bar is formed without the intervention of a mandrel. This piece in its present shape is obtained by interrupting the action of the rolls while the bar is still on its way through them, and then breaking off the bar so as to expose that part where the hollow is just commencing to form. This piece is sound in its solid part, as well as in the hollow part, and the inner surface of the commencing tube is crystalline. This shows that no mandrel can have acted on it. Besides this, the inner surface is not oxidized as it would have been if it had been exposed to the air at a red or white heat. The bright surface is preserved because no air need enter the tube during formation. Until such a specimen as you have before you is cut open a vacuum exists in the interior, both ends being hermetically closed. Such a specimen is made by slightly pointing the bar at the two ends, so that they escape the full action of the rolls at its entry and exit.

This curious result can always be obtained, and it quite disposes of the allegations that the whole is made by a mandrel. The specimen shows also both how the tube in the center commences by a fracture of the metal and widens out, and also the twist of the fibre is seen which has the appearance of a rope. This peculiar twist of the fibre assists in giving the tubes their great toughness and resisting power. The various specimens put before you are mostly produced from the relatively cheap open-hearth steel. The Mannesmann process in shaping metals upsets most of the hitherto accepted ideas and conditions, inasmuch as, instead of avoiding any twist of the fibers, it by one operation gives the greatest possible twist to the fiber with a corresponding stretch of material. It moreover, as I have already said, may, assisted by a mandrel, increase the outer diameter of a bar instead of diminishing it, as do all other rolling mills. The tube produced by the Mannesmann process is generally greater in diameter than the bar from which it is formed.

The child is at its birth larger than the parent. From this description and the facts here attempted to be given, it is evident that we have in the Mannesmann process a system of rolling as new as it is capable of producing effects hitherto not contemplated. In combining all the various systems of rolling, as described above, it may claim to be called the universal system of rolling, in which all hitherto known rolling processes represent a part. The old polishing and straightening machine could never, it is evident, produce like results, because the essential constructive conditions are wanting. It is remarkable that not only competitors, but otherwise competent men, rejected the Mannesmann process as either not new, or as being wrong in principle and generally impracticable, and this sweeping condemnation was supported by arguments apparently logical and sound. I trust this short explanation of an intricate and novel process, and I may say principle, of rolling tubes from solid ingots may assist in dispelling the incredulity and prejudice that has grown up around it.

A New Cane Mill.

Messrs. Krajewski & Pesant, proprietors of the Erie Basin Iron Works, at Brooklyn, N. Y., have just completed and ready for shipment an improved form of cane mill which, aside from novelty of design, is remarkable for the fact that it is probably the largest piece of machinery of this kind that has ever been turned out.

The mill was built for the estate San Ramon, Cuba, and, unlike the ordinary forms having simply two crusher rolls, it has four rolls, two of them being what are termed cutter rolls for breaking up the cane before it passes to the crusher rolls proper. These cutter rolls are about 28 inches in diameter and 7 feet long, and consist of steel rings with suitable cutter projections slipped over wrought-iron shafts. The cane in passing through them is thoroughly broken up, and yields about one-half its juice. It is then fed through the crusher rolls, which also measure 7 feet in length, but are 6 feet 6 inches in diameter, and which extract the remaining juice, all of which falls into a large pan underneath, and can there be drawn off. By means of a pressure regulating device a pressure ranging up to 1000 tons can be brought on the rolls. Power for driving these is supplied by a 250 horse-power engine of the plain slide-valve type, the exhaust being used for heating the vacuum pans. Some idea of the size of the mill can perhaps be formed when we state that with engine and gearing complete it weighs over 300 tons. By means of the cutter rolls, which constitute the principal feature of the mill, a large increase is secured in the proportion of juice obtained as compared with the delivery of the ordinary two-roll crusher mill, and Mr. Krajewski tells us that they are now furnishing independent cutter-roll attachments to be used in connection with the older type mills. In this way the advantages of increased juice production can readily be secured without putting down an entirely new crushing plant.

Combined Engine and Boiler.—Mr.

F. J. Curtis, of Spencerport, N. Y., is putting on the market a combined engine and boiler, which in many respects will be found convenient for small power users. The engine is made either automatic or of the throttling type, as may be desired, and is rated at three horse-power. The cylinder is $8\frac{1}{4}$ inches in diameter by $4\frac{1}{4}$ -inch stroke. The bearings are made to take up wear, and the cross head is provided with adjustable brasses. Boiler and engine are on one base, making a compact and simple outfit. The boiler feed pump is inside the frame.

In our description of the Wheeling Steel Works in *The Iron Age* of October 4 a few errors were committed which require correction. The works were built by the three companies now operating them—namely, the Benwood Iron Works, the Belmont Nail Works and the Wheeling Iron and Nail Works—to manufacture steel for their own use and for the general market. The maximum output has been 450 tons per day and a weekly product of 2200 tons of finished material. The blooming mill is a 36-inch reversing mill built by Mackintosh & Hemphill, driven by a 40 x 48-inch engine constructed by the Southwalk Foundry and Machine Company. The capacity of the shear is to cut an 8 x 15-inch hot section. The E. P. Allis blowing engines are double, having 36-inch steam and 48-inch blast cylinders, of 5-foot stroke. The engine is of special design, the power being transmitted through rocking disks on principal shafts, with a fly-wheel on a countershaft rotated by direct connection with the disks.

Iron Ores and Coals on the South Atlantic and Ohio Railroad.

The control of the South Atlantic and Ohio Road, which extends from Bristol, Tenn., northwest about 40 miles, and which is to be extended to Big Stone Gap, on the line between Virginia and Kentucky, has passed into the hands of Dr. J. M. Bailey, president of the Bailey Construction Company, who has bought all the stock and bonds, and about 30,000 acres of mineral and coal lands lying contiguous to the line of the proposed extension, together with 1000 acres of town lots in Bristol, Tenn., and a similar quantity in Elizabethton, about 20 miles south on the Watauga River in the magnetic ore regions. These purchases aggregate \$1,200,000, and Dr. Bailey has also bought out the interests of the Virginia, Tennessee and Carolina Steel and Iron Company in this region. The money has been provided for the building of the road to Big Stone Gap. The Louisville and Nashville is to extend its Cumberland Valley branch from Pineville to Big Stone Gap, where connection will be made with this road. Arrangements are completed for the erection of a large furnace, with 160 tons daily capacity, at Bristol. The plan proposes two furnaces of that size and a rolling mill. State geologist, John R. Proctor, of Kentucky, has made the following report on the iron and coal fields along the line of the road:

Coals.—Big Stone Gap is one of the natural passes leading from the South Appalachian coal field to the great coalless area stretching from southwestward to the Atlantic Ocean. Immediately north of the Gap the coal measures have a very great thickness above drainage, and there are found a number of thick coals, some of exceptional excellence. One coal has a thickness over a large area immediately tributary to the Gap of from 6 to 8 feet of coal, is most advantageously located for cheap mining, and is a superior coke, having from 93 to 95 per cent. of fixed carbon, with from 3 to 5 per cent. ash, and very low in sulphur. In addition to this very superior coking coal are cannel, splint and excellent gas coals. In Powell's mountain there is a southern extension of this field where three coals are present. An excellent coke has been made from one of these coals. Your company owns the most valuable portion of this outlying coal field. These coals are the more valuable because of the proximity of the iron ores along the line of your road and because they are the nearest coal to the great deposits of high grade Bessemer steel ores in East Tennessee and western North Carolina, and they are of especial value to the South Atlantic and Ohio Railroad because that road has secured the shortest and most available route for the bringing together these cokes and steel-making ores.

Iron Ores.—The red fossil or Clinton iron ore is parallel and immediately along the line of the railway for a distance of 14 miles. This ore is a reliable stratified ore, and three beds are known to be present, one ranging from 30° to 65° thick of excellent soft ore, averaging from a large number of analyses from 45 per cent. to 54 per cent. of metallic iron, another ranging from 18° to 24° thick. This ore can be mined at low cost, say from 50 cents to \$1 per ton, and I think it safe to assume that you have on the line of the S. O. & O. R. R. 20,000,000 tons of this ore that can be put upon the cars at the above named rate. This will give a freightage of 1000 tons a day for 54 years. Recently a new ore horizon has been developed from Big Stone Gap along the line of the road parallel to the above mentioned, and again along the Southern base of Clinch Mount. This is a limonite or brown ore, and is

a reliable and extensive deposit. It is in the Oriskany of the upper Silurian. I superintended the openings made in this ore at a number of places along the line of the road, enough to convince me that there is a deposit of very fine limonite ore exceeding in quantity the Clinton or red fossil ore above referred to. At one point where several openings were made, I was convinced that, along a line of 3500 feet, 780,000 tons of ore can be had above drainage. This ore will yield from 50 per cent. to 55 per cent. of iron, and is low in silica and phosphorus. There is enough of this ore immediately along the line of the road to furnish freight sufficient for a long time to pay a large interest upon the cost of the road. At Clifton Forge District in West Virginia, where this same ore has been developed, the furnaces and industries developed by it furnish one-eleventh of all the freight of the Chesapeake and Ohio Railroad, and the ore there is 90 miles from a coking coal.

In addition to the above, ores are found near to the line of the road: 1, masses in the Trenton and Knox limestones and shales of the lower Silurian. Rich ores, with, in one instance, low enough phosphorus for Bessemer pig; 2, pockets of ore in Medina sandstone near top of Clinch Mountain; 3, stratified ore 2 feet thick in Chemung Shales. Immediately beyond (southeast) Bristol, and only from two to seven miles distant, are large deposits of semi-magnetic ores, with from 55 per cent. to 60 per cent. iron and very low in phosphorus. I will not dwell here on the immense deposits of limonite ores on the waters of the Watauga, and the specular and magnetic ores, nor on the large deposits of manganese, although these great deposits must in large measure be smelted by the coke from Big Stone Gap and Stock Creek, and thus furnish an immense freightage to the S. A. and O. R. R. The Norfolk and Western extended a branch road to the Cripple Creek ores on the south and to the coal on the north, and developed a mineral freightage of 48,311 tons in 1882 to 1,417,549 tons in 1887. The S. A. and O. will penetrate a coal field equal if not superior, and passes through deposits of ore more abundant and superior in quality to anything yet reached by the N. & W., and there is no reason why the freightage of the S. A. & O. may not be developed to the utmost capacity of the road.

I wish to call attention to the great advantage possessed by your road in the manner in which it secures great natural passes through the mountains. There are seven ranges of mountains running northeast and southwest, opposing almost impassable barriers to the construction of railways except by the route secured by this road. Some of the most successful manufacturers of iron and steel in Pennsylvania have made large investments along the line of the S. A. & O. R. R., intending to develop their properties as soon as the road reaches the coking coals. This insures a heavy permanent traffic to the road. The extension of roads now in progress of construction both to the southeast of Bristol and to the northeast and northwest of Big Stone Gap will make the S. A. & O. R. R. an important and indispensable link connecting the Great Ohio Valley with the South Atlantic Seaboard. I know of no road with a greater combination of advantages: Coals, iron ores of exceptional excellence, and in the greatest abundance, timber and building stone, fertile soils, and the certainty of favorable connections with important railways at both termini.

The product of the Calumet and Hecla mine for the month of September was the largest it has ever made, amounting to 3084 tons, 1305 pounds. Its product for

the week ending Monday, October 1, was also the largest ever made in one week, amounting to 789 tons, 135 pounds. Lately the mine made its best record for one day, the profit on the yield of 24 hours' work being estimated at \$18,000.

Pittsburgh Freight Rates Eastward!

—At a meeting of the Pittsburgh Committee of Freight Agents, held in that city on Friday, the 5th inst., new rates were made to all points East. This was done to make the tariff conform with the through rates from Chicago to New York, which go into effect on the 15th inst. The rates from Pittsburgh and all Pittsburgh group points are: To New York, first-class, 45 cents; second, 39 cents; third, 30 cents; fourth, 21 cents; fifth, 18 cents; sixth, 15 cents. Iron and steel less than carloads, 19 cents, and carloads, 16 cents per 100 pounds. Pig iron, in carload lots, \$2.40 per gross ton. To Philadelphia, 39 cents, 33 cents, 28 cents, 19 cents, 16 cents, 13 cents, 14 cents, 11 cents and \$2. To Boston, 51 cents, 45 cents, 33 cents, 24 cents, 21 cents, 18 cents, 19 cents and 16 cents. To Baltimore, 37 cents, 31 cents, 27 cents, 18 cents, 15 cents, 12 cents, 13 cents and 10 cents and \$1.80.

Shrinkage Allowance for Tires.

Breakages of tires on railways may, to some extent, be accounted for by the fact that many tires are put on with too great an allowance for shrinkage. This keeps the tire in severe tension all the time and is a constant source of danger. There is every reason to believe that the allowances established about a year ago by the Master Mechanics' Association are about right, and it may, therefore, not be without interest to give them here. They are for inside diameters of tire:

38 inches less 0.040 inch.	56 inches less 0.060 inch.
44 inches less 0.047 inch.	62 inches less 0.068 inch.
50 inches less 0.053 inch.	68 inches less 0.070 inch.

Judge Andrews, of the Supreme Court in this city, has decided in favor of the application of the Elevated Railroad Companies for the appointment of Commissioners to assess the value of the easement which they require in operating their lines in front of private property. He became satisfied that all efforts of the petitioners to purchase real estate, in cases where suits are pending, would be fruitless on account of the impossibility of agreeing upon a "reasonable" valuation. Therefore, each of the parties may nominate a commissioner, and a third will be appointed by the court to act in all the proceedings.

The question has been asked, and last year was submitted to a committee of the Master Mechanics' Association, how big should a locomotive boiler be? The committee submitted their answer in a report to the last convention of the association, and the rule given in that report for calculating the heating surface of a locomotive boiler for engines with cylinders of 24-inch stroke was that the area of one piston in square inches should be multiplied by 5.8 and the product would be the total heating surface in square feet.

The suit of I. Townsend Burden against James A. Burden and the Burden Iron Company which was being heard before Justice Parker in the Circuit Court at Troy, N. Y., has been postponed till November 15.

It is reported that the Kishpaugh mines, in Warren County, N. J., have suspended operations. They were owned and operated by Pardee & Co. A shaft has been sunk to the depth of 500 feet, and the vein is found to be exhausted.

Our Population in 1890.

The census of 1890, preparations for which are already being made, promises to show in the United States a population of more than 70,000,000. The population in 1880, according to the census of that year, was 50,155,783 persons, of whom 43,475,840 were native, and 6,679,943 foreign-born. The natives had increased 10,484,698 from the figures of 1870—32,991,142—or 31.5 per cent. The foreign element had gained more slowly, however, bringing the percentage for the entire population down to 30 per cent. The same rate of increase applied to the census of 1880 will, according to the *Philadelphia Record*, give an increase of 15,046,639 persons during ten years ending in 1890.

The immigration between 1870 and 1880 was comparatively light, only 1,112,714 persons having come to this country during that decade. For the past few years, however, it has been unprecedented. The immigration since the last census has been as follows :

1880.....	457,257	1886.....	334,203
1881.....	669,431	1887.....	400,109
1882.....	788,992	1888 (8 months)	380,000
1883.....	603,322		
1884.....	518,592		4,637,252
1885.....	395,346		

Estimate for 2 years and 4 months....1,100,000

Total for 10 years.....5,737,252

Add this total to the increase in the native-born population at the rate which prevailed from 1870 to 1880, and it will be found that the probable increase in population during the present decade, after making due allowances for births and deaths, will have been 20,246,639, and the total population in 1890, native and foreign-born, 70,322,479, divided as follows :

Native.....	32,991,142	43,475,840	58,522,479
Foreign-born...	5,567,229	6,679,943	11,800,000

Total.....38,558,371 50,155,783 70,322,479

It is very evident that the foreign element will form a much larger proportion of the population in 1890 than ever before. In 1860 this proportion was about 13 per cent.; in 1870, 14 per cent., and in 1880, about 15 per cent. In 1890 it will not be far from 18 per cent.

New Car Mortiser and Borer.

We illustrate on this page a new car mortiser, built by the Egan Company, 179 to 199 West Front street, Cincinnati, Ohio. It is a very heavy and substantial machine, designed to cut any size mortise from $\frac{1}{4}$ to 3 inches wide and 6 inches deep in all kinds of wood.

The column is one casting, and, being hollow, makes it amply strong enough to stand up to the heaviest strain to which a machine of this kind may be put. The tight and loose pulleys are placed on the fly-wheel shaft to run between bearings, thus equalizing the strain of the belt and keeping the shaft in line. All the working parts are planed perfectly true, and are accurately fitted and gibbed, which allows the machine to cut a perfectly straight mortise. The chisel mandrel is large in diameter, and is made of the best cast steel. It is connected to a solid ram working in planed ways, making it impossible for the mandrel to spring when mortising the hardest kind of wood at the full stroke. The chisel-reverser is entirely new and perfectly automatic. It is controlled by the treadle movement operating upon the chisel mandrel, and reversing the chisel every time the treadle is brought to the up-stroke. All other car mortisers with a graduating stroke are reversed by hand. The radial slide is entirely new, and is covered by letters patent. It is at-

tached to the connections and operated by the treadle, and prevents the slightest jar on the foot, even when mortising without first boring a hole to admit the chisel, which, it is claimed, has never been accomplished heretofore on a machine of this class. The bed is very large, and is

in. The auxiliary mandrel has a 16-inch stroke, and may be moved by a hand-wheel and screw to bore at any point within the width of the bed, which is 18 inches. Each boring mandrel is driven by a pulley on the machine, making the machine complete and self-contained.

CAR MORTISING AND BORING MACHINE, BUILT BY THE EGAN CO., CINCINNATI, OHIO.

raised and lowered by a right and left hand screw, placed vertically between the bottom of the bed and the base of the column. It has a lateral movement of 4 feet, and a cross movement for mortising of 16-inch timbers.

There are two boring mandrels. One is in line with the chisel, and is intended to bore the hole for the chisel to start to work

Each machine is furnished with seven chisels, $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$, 1, 1 $\frac{1}{2}$ and 1 $\frac{3}{4}$ inch, with augers to match; also with three boring bits for the auxiliary boring mandrel, $\frac{1}{4}$, $\frac{1}{2}$ and $\frac{3}{4}$ inch. One of these mortisers was recently shipped to the American Refrigerator Transit Company, St. Louis, Mo., for use in their car-shops, where it is doing good work.

THE MINING ENGINEERS

MEETING AT BUFFALO.

The 52d meeting of the American Institute of Mining Engineers was held in Buffalo last week, the members gathering for the opening session on Wednesday evening in the rooms of the Society of Natural Science, an address of welcome being delivered by Dr. Julius Pohlman, which was responded to by Prof. William B. Potter, of the Washington University, St. Louis, president of the Institute. The latter delivered an address dealing largely with the necessity of supplementing theoretical instruction with training in practical work. Dr. R. W. Raymond presented a brief paper on "A Gold Breast-plate from Central America," found by miners who were digging the foundation for a stamp mill at the Great Remance quartz mine, 15 miles from Santiago, United States of Colombia.

Wednesday morning the members were taken by a special train on the Western New York and Philadelphia Railroad to Dunkirk, where they visited the Brooks Locomotive Works, and were entertained subsequently. The evening session was opened by a paper read by F. V. Greene, formerly in charge of Government work at Washington, and now Vice-President of the Barber Asphalt Paving Company.

ASPHALT AND ITS USES.

He reviews briefly the characteristics of hydraulic and bituminous cements, the solid native mineral pitch or hard bitumen found in nature being what is known as asphalt. By far the most important, commercially, are the combinations of bitumen with quartz or limestone. Among the former are the bituminous sandstones and sands of France, which contain from 5 to 15 per cent. of bitumen mixed with sand and a small amount of limestone and clay. They are used for the extraction of bitumen, the process consisting of boiling in water at a temperature which fuses the bitumen and allows the sand to settle. The greater portion of this supply has now been exhausted. The bituminous sandstones of California have been used lately to supply the material for paving in Los Angeles and other cities on the Pacific coast, the reports of the quality being conflicting.

The bitumen limestones of France, at Seysell and Val-de-Travers contain about 10 to 11 per cent. of bitumen and have furnished the material with which portions of the streets of Paris and other cities are paved, Paris having about 13 miles, London 15 miles, Berlin 9 miles, and other cities 10 miles. Their main drawback has been the tendency to polish under traffic, which has made the pavement slippery. For sidewalks in Paris and elsewhere a preparation known as "asphalt mastic" is used. The powdered rock is mixed with 8 per cent. of molten Trinidad asphalt cooked for five hours at 280° F., and run into molds weighing about 50 pounds, in which form the mastic is sold. In use 60 parts of broken mastic is mixed with 4 parts of Trinidad asphalt and 36 parts of fine gravel and sand cooked for about two hours at 300° F., stirred and poured on the prepared foundation of the sidewalk. The aggregate length of these sidewalks in Paris is about 1000 miles.

The asphalt of Trinidad is found in a so-called "lake," situated at an altitude of about 100 feet above the sea, and about 3 miles from the shore of the island at the village of La Brea. Its area is about 114 acres and its depth as far as ascertained by rude borings is reported to be about 18 feet at the sides and 78 feet in the center, a bed of blue clay underlying it. If these figures are correct the lake contains about 6,000,000 tons of asphalt, the

excavation thus far of 180,000 tons not having appreciably lowered its level. It is an entire misnomer to call it a lake. It is a level tract of brownish material, cracks or fissures, having a width and depth of a few feet, appearing here and there over the surface, a part of them filled with rain water or with dust and vegetation. It is shipped in bulk, and on being unloaded is treated by a slow fire in large tanks for about five hours, the moisture only being expelled without changing its chemical condition. The crude asphalt by analysis of Prof. H. C. Bowen contains 56.79 per cent. of bitumen, 33.99 per cent. of earthy matter, chiefly clay and fine sand, and 9.31 per cent. of vegetable matter.

In its natural state it is too brittle at ordinary temperatures, so that it is tempered with some form of oil, one-third of turpentine and one-sixth of shellac being used for varnish, and one-sixth of petroleum for paving cement or for coating water pipes. Asphalt is employed also as an ingredient in the mixture known as bitile, made by the Callendar Insulating Company, used to insulate electric cables. Mr. Greene cited some interesting applications of asphalt as a cement in masonry work, among others the brick arch spanning the large wrought-iron water main on the high bridge over the Harlem River, and the La Salle street tunnel under the Chicago River. Of the use of asphalt in foundations, two samples are given in a paper read before the English Institution of Civil Engineers in 1880, by W. H. Delano. One was the foundation of a rock disintegrator running at a high rate of speed, first built upon a concrete foundation. On the opposite side of the street was an establishment for painting on glass and china, the business of which was seriously interfered with by the vibrations. After rebuilding the foundation in bituminous concrete the vibrations were imperceptible.

The second case was the foundation of a large trip hammer, weighing 45 tons, erected at the Paris Exhibition of 1867. In order to reduce the concussion, this was built in bituminous concrete with entire success.

Of all the uses made of asphalt, by far the most important is the paving of roadways. During the last 12 years, upward of 3,500,000 square yards of genuine asphalt pavements have been laid in the United States. They extend a length of more than 200 miles, and are used daily by probably 50,000 vehicles. The cubical contents are over 7,000,000 cubic feet, and with their foundations of concrete, of 16,000,000 cubic feet, their weight represents 1,500,000 tons.

The city of Buffalo has now the distinction of having more asphalt pavements than any city in the world, though the combined area of the asphalt and the tar pavements in Washington is still greater by about 50 per cent. The area of the asphalt at Buffalo is 1,000,248 square yards, extending over a length of 51 miles more than the combined area of all the asphalt roadways in Europe.

Mr. Greene described the method of making the asphalt pavement, and noted the following striking illustration of the strength of such a concrete with age: At Washington he observed a small hole in such a pavement, and having had it opened found that the cavity was about 20 x 40 feet in extent and from 4 to 5 feet deep. The earth had been washed into a defective sewer, and it must have taken months, if not a year, for this to occur, the hole in the sewer being quite small. During all this time the pavement was simply a concrete arch 6 inches thick and paving a space of about 20 feet.

Mr. Greene gave the following excellent reason for the fact that a good deal of the so-called asphalt pavement, in reality

made of tar, soon becomes worthless: The products of coal tar are subject to oxidation by the atmosphere, which in time renders them brittle and friable and devoid of cementing qualities. The Trinidad asphalt is not subject to this defect, for the reason that it has been exposed for centuries to the burning sun of a tropical climate and the atmosphere can have no further effect upon it. After dealing with these so-called monolithic pavements, Mr. Greene described the block pavements, which are very serviceable under certain conditions. The fact, however, that sand cannot be used in the mixture of the blocks, because it cuts the molds, makes it impossible to employ them for heavy traffic.

One interesting point was raised by Mr. Greene in conclusion in his paper, and that is the saving in traction force and in wear and tear of vehicles. He stated that it was susceptible of direct proof that if the cost of paving a large city like New York with asphalt be counted, maintaining it at the price shown by years of experience under varying weights of traffic, and if the saving in cost of transportation and wear and tear of vehicles be counted, the saving is nearly three times the cost. The transportation through the streets of New York is something over 40,000,000 ton miles per annum, costing over \$15,000,000, and the repairs of its 30,000 vehicles and the shoeing of its 40,000 horses cost nearly \$4,000,000 in addition.

The same force that draws one ton over a stone block pavement can draw three tons over asphalt, and the cost of repairs of vehicles and horses can be reduced about one-quarter by the use of smooth pavements. The saving runs into the millions of dollars annually.

During the course of the discussion Dr. Raymond gave the experience of the Brooklyn Subway Commission, of which he is a member, with asphalt pipe, the main difficulty being that in endeavoring to make joints ridges formed on the inside which injured the covering of the cables.

Dr. Julius Pohlman then presented a sketch of his views on the life history of Niagara Falls, in which he took the ground, elaborating his evidence, that the Falls did not cut their way back from Lewiston, but from a point about the present Whirlpool Rapids. He condemned also the opinion so generally held that the Falls moved upward at a slow rate by showing that between 1841 and 1886, the first and last surveys made, the Horseshoe Falls went back 485 feet, or at the rate of about 9 feet a year. Dr. Pohlman's address was received with hearty applause, and he was urged to present his paper in form for the transactions.

Dr. R. W. Raymond then read a paper on "Soaping Geysers." It appears that his attention was directed to it by the story of a party of returned tourists of a Chinese laundryman in the National Park who had included in his cabin a hot spring, of which he was accustomed to avail himself in his business, and who, on one occasion, having thrown a lot of linen into this spring to soak over night, had added a piece of soap to facilitate the process, and had been considerably surprised when, stimulated by this soap, the spring had suddenly become a geyser and wrecked his establishment.

Mr. Arnold Hague, geologist in charge of that part of the Survey which includes the National Park, confirmed the action of soap upon geysers in a letter to Dr. Raymond, and noted the effect of the substitution of soap by lye, which produces much more rapid action. Mr. Hague's letter goes into detail in regard to the results of his investigations, to which Dr. Raymond has added his views on the probable causes of the action of soluble salts thrown into the water.

Thursday had been set aside for a number of excursions, which were to enable the members to inspect the coal and ore docks and elevators for which Buffalo has grown so famous, but inclement weather interfered with the projected tour, only a few undertaking the trip. The afternoon was occupied with a visit to the water works pumping station, the Buffalo Cement Company and the Barber Asphalt Paving Company, a number of carriages conveying the party over a long route through different parts of the city, to enable them to judge by themselves of the difference between the ordinary methods of paving streets and those based upon the use of asphalt.

In the evening the secretary read an interesting paper by Bernard E. Fernow, of Washington, on "Forestry and Mining," and a note by Uriah Cummings, of Buffalo, on the "Artificial Propagation of Mushrooms in the Abandoned Quarries of the Akron Cement Company, at Akron, N. Y."

Friday morning was devoted to a session, the first most important paper being read by R. W. Hunt, formerly of the Troy Steel and Iron Company, and now located at Chicago. We shall present Mr. Hunt's paper in greater detail, but may state that its object was to give the grounds for the adoption of a series of new specifications for rails. Mr. Hunt, we may say in passing, expressed the opinion that, generally speaking, the heaviest sections which have begun to secure recognition in the United States have been disappointing, so far as their wear is concerned, and that in the majority of instances their relative failure to yield adequate wear is due to faulty design. Generally speaking, the increased weight has been secured by a greater depth of metal in the head, a policy which Mr. Hunt questions chiefly on the basis of a long experience in rail manufacturer. He quoted an instance of two rails, a 65-pound and a 60-pound, which were identical except that the additional weight of the former had been secured by adding to the top. The lighter rail gave the better results. Mr. Hunt urges that the rails should be straightened as much as possible when hot, the minimum of work being done by the gagging press, and condemns the application of a gag to flanges. He urges the use of harder steel for heavier rails, and insists that the practice of turning the ingots on their side before their interior has entirely chilled is dangerous, because it is liable to create lengthwise crevices.

R. P. Rothwell, of New York, spoke on the subject of "Electrical Transmission of Power in Mining," the first application of which was made in New Zealand to drive a stamp mill. In Aspen, Col., water-power has been transmitted to the mines, to the pumping and hoisting machinery, and also to the machinery at the coke ovens. A large installation is now being put in at the Nevada mill on the Comstock Lode, water being taken to the level of the Sutro tunnel, giving a 1630-foot head, which drives six 40-inch Pelton wheels, each of 135 horse-power, driving the dynamos direct. The Brush Electric Company have provided the dynamos, each of 135 horse-power, and six electric motors, each of 90 horse-power, which are to drive the machinery of the Nevada mill. The longest transmission thus far has been on the Feather River in California, the circuit being about 18 miles. In Alaska, the water-power on the mainland is to be used to drive 240 stamps, of the famous Treadwell mine.

In the afternoon the Institute visited the works of the Holly Mfg. Company, at Lockport, and the Cowles Electric Reduction Works at the same point. On Saturday morning the members took a special train to Piffards, where they visited the

rock-salt mine of the Retsof Company, near that point, the majority of the members being lowered into the 1100-foot shaft and inspecting the underground workings, which are carried on in two beds, one of 20, and one of 60 feet thickness. Above ground they viewed the operations of crushing and preparing the salt for market. Returning to Buffalo, the meeting adjourned.

The Senate Tariff Bill.

We print elsewhere a table giving, so far as it is possible, a comparison of the rates of duty provided for in the Mills and Senate bills with the tariff as it now exists. A study of it will best show where changes have been made and in what direction. We may note, besides, the following points in the Senate bill:

The iron ore clause contains a provision which puts at rest the moisture question, since it specifies "that in levying and collecting the duty on iron ore no deduction shall be made from the weight of the ore on account of moisture which may be chemically or physically combined therewith."

Mill irons and mill cranks of wrought iron, and wrought iron for ships and forgings of iron or steel, or of combined iron and steel, for vessels, steam engines and locomotives, or parts thereof, weighing each 25 pounds or more, are put at 1.8 cents per pound.

The wire-rod clause is specific and reads:

Rivet, screw, nail, fence and other iron or steel wire rods, whether round, oval, flat or square, in coils or loops or in any other shape, not smaller than No. 6 wire gauge, valued at three cents or less per pound, six-tenths of one cent per pound; and iron or steel flat, with longitudinal ribs for the manufacture of fencing, valued at three cents or less per pound, six-tenths of one cent per pound; provided that all iron or steel rods, whether rolled or drawn, smaller than No. 6 wire gauge, shall be classed and dutiable as wire.

The law relating to ingots, blooms and billets is particularly extensive, and we quote it as below:

Steel ingots, cogged ingots, blooms and slabs, by whatever process made; die blocks or blanks; billets and bars and tapered or beveled bars; steamer, crank and other shafts; shafting; wrist or crank pins; connecting-rods and piston-rods; pressed, sheared or stamped shapes; saw plates, wholly or partially manufactured; hammer molds or swaged steel; gun-barrel molds, not in bars; alloys used as substitutes for steel tools; all descriptions and shapes of dry sand, loam or iron-molded steel castings; sheets and plates not specially enumerated or provided for in this act; steel in all forms and shapes not specially enumerated or provided for in this act; all of the above valued at 1 cent per pound or less, five-tenths of a cent per pound; valued above 1 cent and not above one and four-tenths cents per pound, six-tenths of 1 cent per pound; valued above one and four-tenths cents, and not above one and eight-tenths cents per pound, eight-tenths of 1 cent per pound; valued above one and eight-tenths cents, and not above two and two-tenths cents per pound, nine-tenths of 1 cent per pound; valued above two and two-tenths cents, and not above 3 cents per pound, one and two-tenths cents per pound; valued above 3 cents and not above 4 cents per pound, one and six-tenths cents per pound; valued above 4 cents, and not above 7 cents per pound, 2 cents per pound; valued above 7 cents, and not above 10 cents per pound, two and eight-tenths cents per pound; valued above 10 cents, and not above 13 cents per pound, 3½ cents per pound; valued above 13 cents per pound, 45 per centum ad valorem.

These provisions compare as follows:

Steel valued	Existing law.	Senate substitute.
1 c. per lb. or less.....	45 per cent ..	½ c. per lb.
1 c. @ 1.4 c..	" ..	6-10 c. per lb.
1.4 c. @ 1.8 c..	" ..	8-10 c. per lb.
1.8 c. @ 2.2 c..	" ..	9-10 c. per lb.
2.2 c. @ 3 c..	" ..	1.2 c. per lb.
3 c. @ 4 c..	" ..	1.6 c. per lb.
4 c. @ 7 c..	2 c. per lb.	2 c. per lb.
7 c. @ 10 c..	2.75 c. per lb.	2.8 c. per lb.
10 c. @ 13 c..	3.25 c. per lb.	3.5 c. per lb.
above 13c.	3.25 c. per lb.	45 % ad val.

Plates are not mentioned in the Mills bill. In the Senate bill the clause relating to them reads as follows:

Boiler or other plate iron or steel, except saw plates hereinafter provided for, not thinner than number ten wire gauge, sheared or unsheared, and skelp iron or steel sheared or rolled in grooves, valued at two cents per pound or less, one cent per pound; valued above two cents and not above three cents per pound, one and two-tenths cents per pound; valued above three cents and not above four cents per pound, one and six-tenths cents per pound; valued above four cents and not above seven cents per pound, two cents per pound; valued above seven cents and not above ten cents per pound, two and eight-tenths cents per pound; valued above ten cents and not above thirteen cents per pound, three and one-half cents per pound; valued above thirteen cents per pound, forty-five per centum ad valorem; *Provided*, That all plate iron or steel thinner than number ten wire gauge shall pay duty as iron or steel sheets.

In the case of quite a number of articles changes have been proposed by the Senate Substitute bill, where the existing law and the Mills bill agree. We enumerate them as under, giving the rate of the Senate bill and adding the present rate in brackets. It will be observed that these readjustments are in the direction of a lowering of duties in the majority of instances.

Cast-iron vessels, plates, stove plates, andirons, &c., 1.2 cents per pound [1½ cents].

Malleable iron castings, 1½ cents per pound [2 cents per pound].

The Senate bill follows the present law so far as the fact that no allowance is made for discoloration or partial loss in consequence of rust is concerned. It repeats also that paragraph which defines what material is to be regarded as steel. It has also the following two new clauses:

All articles not specially enumerated or provided for in this act, wholly or partly manufactured, made from sheet, plate, hoop, band, or scroll iron or steel herein provided for, or of which such sheet, plate, hoop, band, or scroll iron or steel shall be the material of chief value, shall not pay a lower rate of duty than that imposed on the sheet, plate, hoop, band, or scroll iron or steel from which they are made, or which shall be the material of chief value.

On all iron or steel bars, rods, strips or steel sheets, of whatever shape, other than the polished, planished, or glanced sheet iron or sheet steel hereinbefore provided for, and on all iron or steel bars of irregular shape or section, which are cold-rolled, cold-hammered or polished in any way in addition to the ordinary process of hot rolling or hammering, there shall be paid one-fourth of one cent per pound in addition to the rates provided in this act; and on steel circular saw plates there shall be paid one cent per pound in addition to the rate provided in this act.

This makes the rates compare as follows:

Bar Iron and Steel.	
Existing law.	Senate substitute.
45 % plus ¼ c. per lb.	1.6 c. per lb. plus ¼ c.
2 c. plus ¼ c. per lb.	2 c. per lb. plus ¼ c.
2½ c. plus ¼ c. per lb.	2.8 c. per lb. plus ¼ c.
3½ c. plus ¼ c. per lb.	3½ c. per lb. plus ¼ c.
Strips of Iron or Steel.	
45 % plus ¼ c. per lb.	1.6 c. per lb. plus ¼ c.
2½ c. plus ¼ c. per lb.	2.8 c. per lb. plus ¼ c.
3½ c. plus ¼ c. per lb.	3½ c. per lb. plus ¼ c.
Sheet Iron.	
1.5 c. per lb. plus ¼ c.	1.5 c. per lb. plus ¼ c.
Sheet Steel.	
45 % plus ¼ c. per lb.	1.6 c. per lb. plus ¼ c.
2 c. per lb. plus ¼ c.	2 c. per lb. plus ¼ c.
2½ c. per lb. plus ¼ c.	2.8 c. per lb. plus ¼ c.
3½ c.	3.5 c. per lb. plus ¼ c.

Steel circular saw plates, 1 cent in addition, making it 4½ cents per pound [8½ cents and 4½ cents per pound].

For the following items we do not possess the equivalents in the Mills bill at this writing, but we give the present duties and the provisions of the Senate bill.

Swords, sword blades and side arms: Present, 35 per cent.; Senate, 35 per cent.
Table knives, &c.—Valued at not more than \$1 per dozen: Present, 35 per cent.; Senate, 20 cents per dozen + 30 per cent. Valued at \$1 to \$3 per dozen: Present, 35 per cent.; Senate, 50 cents per dozen + 30 per cent. ad valorem. Valued at \$3 to \$8 per dozen: Present, 35 per cent.; Senate, \$1 per dozen + 30 per cent. ad valorem.

Penknives, pocket-knives, blades and razors: Present, 50 per cent.; Senate, 50 cents per dozen blades and 25 per cent. ad valorem.

Muskets and sporting rifles: Present, 25 per cent.; Senate, 25 per cent.

Double-barreled sporting breech-loading shot-guns: Present, 35 per cent.; Senate, \$10 each and 25 per cent. ad valorem.

Pins: Present, 30 per cent.; Senate, 30 per cent.

Screws.—More than 2 inches long: Present, 6 cents per pound; Senate, 5 cents per pound. Over 1 and less than 2 inches: Present, 8 cents per pound; Senate, 7 cents per pound. One-half inch to 1 inch: Present, 10 cents per pound; Senate, 10 cents per pound. One-half inch and less: Present, 12 cents per pound; Senate, 14 cents per pound.

It will be observed that the duty on cutlery is to be modified, and that the rates on the larger screws are lowered, while those on the smallest sizes are increased.

The clause on lead ore has the following addition, which it will be observed covers a point to which the trade has given much attention of late—viz.: Lead ore

The estate of Percy Peck, at Anthony, R. I., consisted of 5 acres of land and the buildings formerly used as a machine shop by S. Colvin & Co., were sold at auction October 2 to Searles Capwell, of Coventry, for \$1400.

The will of the late George M. Cruickshank has been proved, and Mary G. Cruickshank appointed administratrix of the estate; bond, \$12,000.

The property of the Holmes Burglar Alarm Telegraph Company has been sold, and the right, title and interest of all patents belonging to the Holmes Burglar Alarm Telegraph Company, of New York, and of the Holmes Electric Protection Company have been transferred to the Rhode Island Electric Protection Company for the State of Rhode Island, making it a local company. LEONIDAS.

James R. Hosmer, Consul-General of the United States to Guatemala, in a report to

The Growth of the Stove Industry.

A reception and banquet were given last week by the business men of Boston to visiting merchants, with the object, as explained by Chairman George Hutchinson, of promoting mutual interests. Twelve long tables were spread in Mechanics' Hall, with 1400 plates. Speeches followed by Howard W. Spurr, E. Waldo Cutler, Geo. W. Walker and others. The last mentioned spoke of the marvelous growth of the stove industry, by comparison with what it was 50 years ago. He said: "No longer ago than 1829 stove plates were made from iron flowing directly from blast furnaces in Pennsylvania, Virginia and Kentucky, which was then sent to Albany, N. Y., to be mounted into stoves. Prior to 1829-30 wooden patterns for molding purposes were made of mahogany and strapped with light irons to hold them together. To the late Mr. Annis Lincoln, of Norton, Mass., belongs the distinguished honor of making the first stove plates from metal patterns. The first stoves made by him were supplied with wrought-iron feet riveted to the bottom. I wonder what General Manager Furber, of the Boston and Maine Railroad, would say if a shipment of these stoves were sent to one of his depots for transportation? I reckon he would strike against schedule rates and order them billed by the square foot. Fifty years ago cooking stoves were made with only one pot-hole, but an inventive Yankee conceived the idea of making them with two holes, until now they have more holes than pots. Foreign manufacturers acknowledge the superiority of American stoves by purchasing them and then fitting them for patterns to cast from. Stoves and ranges made in England and Scotland could not be sold in this country except for old iron, but I suppose they answer the purposes of free traders. Until within a few years Canada was a good customer for stoves. The duty of 25 per cent. imposed not only protects her mechanics, but deprives us of what was once a lucrative business. From small and crude beginnings the stove business in this country has assumed vast proportions. Our annual product is, in round numbers, not far from 3,000,000 stoves; the value of same is about \$45,000,000. Our facilities, quality of iron, mechanical skill and inventive powers cannot fail, sooner or later, of commanding a large share of the stove trade of the world. That our ranges and stoves have no equals made in any other country is an admitted fact. Those made in New England are of the finest grade, consequently meet with a ready sale at home and abroad."

In the Madras Presidency, in India, the River Kistna is crossed by a cable swung between supports 5070 feet apart, and one has just been put up in China 4648 feet in span. The versed sine of the curve formed by this cable is 514 feet. The whole weight of the suspended portion is only 6½ tons, and the breaking resistance 150,000 pounds, so that there would seem to be no great difficulty, by building the supports high enough, in bridging almost any chasm by similar ropes, and establishing footways between them.

The old Huron Furnace, at Jackson, Ohio, which has been idle since 1884, has been generally repaired and was put in operation last week under the management of a new organization, known as the Jackson Iron Company. The iron will be of the Jackson County silvery class, and the furnace has a capacity of 30 tons per day. Messrs. Charles Himrod & Co., Chicago, have been appointed sales agents for the West and Northwest.

SMALL CENTRIFUGAL PUMPING PLANT.

containing silver, or silver ore containing lead, shall pay a duty of one and one-half cents per pound.

Providence Notes.

The fine steel yacht Ballymena, 148 feet long, was launched from the boathouse of the Herreshoff Mfg. Company, at Bristol, at 8.35 o'clock on the morning of October 6. She is owned by George S. Brown, of the firm of Brown, Shepley & Co., of Baltimore. The Ballymena is the first steel vessel ever built in Rhode Island, and is pronounced to be one of the finest ever built in the country.

The building of the steel torpedo boat for the Government will be begun immediately on the spot from which the Ballymena was launched.

A gang of 30 employees of the American Long-Distance Telephone Company, who have been at work on the line between Worcester and this city, took the Shore Line express train for Bridgeport, Conn., on October 5. From the latter city to New York they will stretch 18 copper wires on poles 50 feet high.

John. A. Moore, whose building was burned down last spring on the Harris farm, Sockanosset, R. I., on which are located the Cranston coal mines, has erected another building, 30 x 40 feet, in which he has placed an engine of 20 horse-power, boiler and crusher. It has a capacity of turning out and crushing about 80 tons of coal a day. The coal from this mine, which, until about three years ago, had remained idle for more than a quarter of a century, has been used continually by Superintendent Eames at the works of the Carbon Iron Company, located on the same farm, for the past year.

the Department of State, says there are favorable inducements for the establishment of factories for glass, wagons, agricultural implements and many other articles of general use which are now imported and command exorbitant prices. Common laborers receive from 37½ to 75 cents per day, and railroad laborers \$1. American carpenters and painters are paid \$4.50 to \$5 a day and machinists \$5 to \$6. American merchants in Guatemala, Mr. Hosmer says, assert that they are compelled to purchase their wares in Europe because the goods sent from America are so carelessly packed as to be badly damaged in transit. American-made prints, agricultural implements and cutlery are preferred to those of other countries, and this has led dealers in Germany to imitate American trade-marks and endeavor thereby to sell their wares as of American make.

Direct Connected Centrifugal Pump.

The Baldwinsville Centrifugal Pump Works, of Syracuse, N. Y., are putting on the market a convenient small-size pumping plant, consisting of a centrifugal pump driven by a direct connected Climax engine. The annexed engraving explains the general design. The engine proper, illustrated in *The Iron Age* some time ago, is of the two-cylinder, vertical, single-acting type. The outfit is cheap, light and durable, and will be found desirable for many locations. Where the lift does not exceed 25 feet the engine is connected directly to the pump shaft, but, in case the lift of water exceeds 25 feet, intermediate cut gears are used, so as to attain the proper speed. The pumps are specially adapted to the use of tanners, contractors and for small irrigating plants.

THE WEEK.

When may we expect the next killing frost? On account of the unusual importance of this question just now General Greely has issued an extract from the monthly weather review for July, 1888, which gives the average date of its appearance in past years. The inference is that the outlook for the cessation of the epidemic is not very encouraging, the tables showing that, although killing frost has been observed at St. Augustine, on November 30, the average date is December 24, and one year frost did not appear until February 6.

The Knights of Labor, whose next General Assembly convenes in Indianapolis, November 13, are said to be at present in no pressing need of money. A few weeks ago, when the need of money was extremely urgent, recourse was had to the Order's investment in the knitting mills at Little Falls, N. Y., and as a result \$5000 was realized. This sum placed the board on their feet again, it is said, and will be sufficient to keep the expenses covered until the payment of the October tax affords relief. In addition to the Little Falls investment, it is said, the Order has money invested in the coke region, which is worth fully \$12,000. The headquarters in Philadelphia, for which \$45,000 was paid, have been carefully guarded against mortgages or other encumbrances, it is said, and are worth considerably over \$50,000 to-day. The printing-office plant, worth \$10,000, has also given the Order a foothold, it is claimed, which is not likely to be shaken.

The Spreckels beet sugar factory, at Watsonville, Cal., has just started up, and is expected to turn out 8,000,000 pounds of sugar this season. A rival factory is in operation at Alvarado.

Trade between New Orleans and Mississippi River towns has been very much interfered with by the steamboat quarantine.

The report of the special Park Commission for the appraisal of lands to be taken in this city and Westchester County for park purposes is now on file and shows that the city is called upon to disburse \$9,592,000, including \$239,860 to defray the expenses of the commission.

The manufacture of big guns at Watervliet arsenal, under the appropriation of \$700,000 by the Federal Government for this purpose, will not commence sooner than a year hence, but the buildings will be put under contract in the spring. Col. J. M. Whittemore, the officer in command, says the guns to be made under the new arrangements will vary in weight from 15 to 50 tons. At present 28 men are employed at the foundry. They will turn out annually one 8-inch and one 10-inch seacoast gun and 25 field pieces. The 10-inch gun now constructing will, it is expected, at its best elevation, throw a ball or shell from eight to nine miles. Referring to the cost of the big 15 and 50 ton guns Col. Whittemore said the cost of turning out such work, not including the cost of steel and other material, was estimated to be \$1000 per ton. The \$700,000 appropriation does not include the making of any guns whatever. That sum is to be expended in building the necessary plant for the construction of 8, 10 and 12-inch guns.

A firm of ship agents in New Orleans have furnished some interesting information showing how money is left in that port by every ship that goes there. The figures are from actual accounts of vessels. The disbursements of the steamship for Queenstown, 1216 tons net, loaded with 86,245 bushels of corn, in April last, were

\$1500.19, on a total freight bill of about \$11,000. The expense account of a British steamship of 1176 tons net, loaded in May with 4800 bales of cotton, footed up \$7860.35 out of a total freight bill of \$13,639. All this was left in New Orleans, except \$2400 for compressing, that having been done in the interior. The expense account of a steamship of 1764 tons net register, loaded in January, 1888, with 207 tons oil cake, was \$3018.91 out of a freight bill of about \$10,000 or £2117. Of the last named case, \$1058.50 was for the stevedore. In the second case, the ship loaded with cotton, the stevedore's bill was \$2401. In the case of the Queenstown the stevedore's bill was \$525.

The annual meeting of the National Board of Steam Navigation will take place at New York, October 23, instead of Pittsburgh, as originally intended. The change was made after consultation with several of the Pittsburgh members.

The North Georgia and Alabama Mineral and Industrial Exposition, opened in Rome during the quarantine panic, has proved highly successful. The exposition will continue until the 13th inst.

The losses by the floods in Mexico are officially estimated at \$3,000,000.

Detroit papers complain that the local authorities are obstructive in their treatment of the proposal to supply the city with natural gas. One of the editors says "the manufacturing interests of the city demand cheap fuel, and the general interest of the city call for compliance with that demand." The argument is that Detroit must have natural gas in order to keep pace with her rivals.

The village of Gloversville, N. Y., has 120 glove manufactories, and Johnstown, in the same neighborhood, 55 more, all employed in working up sheepskin, popularly called "dog skin," together with a small quantity of imported skins, such as the kid and chamois. The annual production has increased to between \$6,000,000 and \$8,000,000. The manufacturers have always been quick to protest against fraudulent valuations at the Custom-House.

Norway will be represented at the International Marine Conference, to be held in Washington city in April next.

There is reason to believe that Alonzo Lewis, a traveler for the firm of W. & B. Douglas, manufacturers of pumps, in this city, is the victim of an atrocious murder. His life is supposed to have been taken by negroes, a few miles from Norfolk, Va., to obtain his money.

The Cleveland, Ohio, Board of Industry has collected statistics which show that the sales and products of crude oil in that city during the year reach the very large aggregate of \$20,000,000, of which \$6,000,000 represents sales of crude for fuel, 10,000 barrels a day, mostly shipped to the Middle and New England States.

The Toronto *Globe* congratulates the people of that city upon the moderateness of the municipal debt and their ability under the law to increase it for any proper purpose. The present debt, it appears, is only \$9,000,000, and it can be increased to \$11,000,000 without violating the restrictive statute. The interest on such a debt at 3½ per cent. would be \$385,000, or \$2.57 per head per annum for the population of the city, estimated at 150,000.

The enormous land transactions of the Union Pacific Railroad appear from the annual report of the Commissioners of Railroads which shows that on December 31, 1887, the company had disposed of 12,944,781 acres of land, the total cash receipts from all sales amounting to \$26,395,951. There remained outstanding on account of time sales the sum

of \$13,538,861. The average price per acre for all sales was \$2.53 for the Union division, \$3.72 for the Kansas division and \$4.24 for the Denver division. The revenue of the road for the year aggregated \$25,129,515 and the expenditures \$19,297,981, leaving a surplus of \$5,831,534. The debt of the company was \$222,169,431, and the assets amounted to \$266,451,137.

The contractor for the Museum of Natural History in Central Park has commenced work.

The validity of speculative contracts was involved in a decision recently rendered by Judge Holmes, of the Supreme Court of Massachusetts, and is a subject appropriate to the times. The loser in the transaction sought to avoid his obligations on the ground that the dealings in question were contrary to public policy and to the law against gambling. Judge Holmes decided against this view, holding that any party has a right to go into the market and make valid contracts, either for purchase or sale of property to be delivered at any future time, with the understanding and agreement between principal and broker that the property purchased may be resold before the day of delivery arrives, and thus settled by mutual adjustment of the two contracts, or receive upon the contract of purchase and deliver on contract of sale, and that there is no rule of law prohibiting such method of carrying on speculative operations.

The corn crop, which is now past all danger, is by far the largest ever harvested in the United States. It will certainly exceed 2,015,000,000 bushels, an increase of not less than 550,000,000 or 600,000,000 bushels over last year's crop. This fact is full of significance as concerns the general business interests of the country. With such a yield of corn the farmers are sure to receive \$200,000,000 more for their crops than in 1887, and that goes a long way toward insuring the prosperity of all classes and industries.

Gibb Ross, a large shipowner and lumber merchant, died at Quebec last week, leaving a fortune estimated at \$10,000,000. He owned 45 sailing vessels, over 100 square miles of timber lands and immense blocks of real estate. He was the largest shareholder in the Quebec & Lake St. John Railroad and was the promoter of a scheme to bridge the St. Lawrence at Quebec.

The last brick in the big chimney of Clark's Thread Mills in Kearney, N. Y., was laid 5th inst, and the American flag was hoisted at the top, 335 feet above the ground. It contains 1,700,000 bricks and was begun 150 days ago. The flue is 11 feet in diameter.

The merchants constituting the Chicago Freight Bureau have not abandoned their proposed war on the transcontinental roads for discriminating in freight rates on Pacific Coast business, but no action will be taken until after the meeting of the Transcontinental Association, 15th inst.

Mr. Leary will construct no more big rafts for ocean navigation, as the work of building and then breaking up such great rafts, to say nothing of transportation, creates an expense greater than that of handling the logs by vessels in the ordinary way.

In the race for industrial supremacy Japan is pushing far ahead of China. It was stated some time since that Japan supplies China with cotton-ginning machines, capable of being driven either by water or steam-power. The English Consul at Hiogo now states that an attempt is to be made to manufacture cotton-spinning machinery also, though he is not sanguine as to the early success of the attempt.

Ozaka, where these machines are made, is becoming an important industrial center. It has cotton mills and other factories, chemical works, dye works, &c. In other towns of Japan similar industries are being established. Railways are being built, steam shipbuilding is being carried on with considerable success, and in general terms it may be pronounced that Japan has made a creditable effort to place herself in line with the advanced civilization of the Western nations.

Senator Cullom expresses fear that the bill to amend the Interstate Commerce law will fail, owing to the difficulty in securing a conference in the absence of members of the committee.

Machinery of American manufacture forms a large part of the cargo of the clipper San Joaquin, now loading at this port for Australia.

According to the estimates made by the Finance Committee, the Senate Tariff bill provides for a total reduction of about \$75,000,000, made up approximately as follows: Sugar, \$27,759,000; free list, \$8,500,000; tobacco (internal revenue), \$24,500,000; alcohol, in the arts, \$7,000,000; other reductions in customs, \$8,000,000.

The Metropolitan Phonograph Company have filed their certificate of incorporation in Queen's County. The capital stock is \$1,000,000. It is organized for a term of 50 years. Victor E. Burke, of New York, and A. L. Taylor and Timothy Cornwall, of Brooklyn, are the incorporators.

In accordance with a provision inserted in the River and Harbor law of this year, the Secretary of War has designated the following officers to constitute a board to establish harbor lines at the port of New York: Col. H. L. Abbott, Col. W. P. Craighill, Col. C. B. Comstock, Lieut. D. C. Houston and Lieut.-Col. W. R. King, all of the Engineer Corps. The Secretary is authorized to establish lines beyond which no piers shall be extended or encroachments allowed. Gen. Casey, chief of engineers, is of the opinion that the piers on either side of the city are within proper limits, but the improvements on the New Jersey side demand immediate attention. The new law is not designed to interfere with the lines established by the harbor commissioners. Those interested will have an opportunity to be heard.

A fine specimen of ironwork, called the new Central Viaduct, is approaching completion in Cleveland, Ohio. The object is to make a crossing over "the Flats," and the contract was taken by the King Iron Bridge and Mfg. Company. The length of the Cuyahoga Valley portion of the bridge is 2838 feet and 6 inches; its height above the river is 101 feet and the span just put in place is 33 feet above the Nickel-Plate tracks. The draw span over the river is 239 feet long. The cantilever trusses are each 135 feet in length and 20 feet in depth, the long arm being 75 feet and the short arm 30 feet long. It will require another month to complete the ironwork.

The movement of the Mormons into Mexico has assumed large proportions and several flourishing colonies have already been established in the valley of the Casas Grand River. A counter movement is the remarkable migration of Mexicans from Sonora into Southern Arizona and New Mexico as far east as El Paso.

It has been rumored in telegraph circles the past week or two that the owners of the Delancy multiplex system were showing much activity, but these reports did not receive attention until it became known that the Standard Oil Company and a number of the heavy representatives of the Pennsylvania road were interested

in a new telegraph company who were in possession of certain valuable patents which would reduce the cost of maintaining electrical communication to less than one-half of the present rate. If the multiplex as at present improved will do half what is claimed for it, it is already proclaimed that a revolution may speedily be looked for in the business of telegraphic communication. It is the purpose of the new company to pay particular attention to commercial transactions between the principal centers of traffic. At night it is proposed to lease wires to the big dailies at \$2500 a year.

Turk's Island, in common with Cuba, suffered severely from a hurricane, 2d ult., and 400,000 bushels of salt were ruined. In Cuba the press in general advocates for the free introduction on the island, during a certain time, of all sorts of implements, machinery and apparatus used on sugar estates.

The New York Chamber of Commerce is divided in reference to the location of the new Federal building to be erected, and the subject has been referred to a committee. Merchants who are well informed, in several instances favor the retention of the Custom House where it is, with an enlargement, and the construction of an appraiser's building alone.

Alarm is felt on account of encroachments on the water space of New York harbor by private parties, who are filling in extensive areas on the Jersey shore, now covered by water at all stages of the tide, and the New York Chamber of Commerce petitions the Secretary of War to take such measures as shall prevent serious permanent injury to the channels at the harbor entrance, as the natural dredging process now in operation is liable to be affected if the outflow of water is retarded.

The sum of \$2,000,000 has been obtained wherewith to build a big bridge between Martin's Ferry and Wheeling, and work will begin at once. The bridge will be 2000 feet long, 90 feet above low water, and built with all "through" spans. The outside estimate of the bridge to be constructed over the Mississippi River at Memphis, by the Fort Scott system, is placed at \$3,000,000.

According to a statement of dividend payments by prominent New England cotton manufacturing corporations, that industry just now is enjoying an almost unprecedented prosperity. Thirty-two concerns paid dividends of \$1,386,190 on a total capital stock of \$17,108,000, an average of over 8 per cent. the first year. One company pays 25 per cent., seven pay 10 to 16½ per cent. and twelve 6 to 9 per cent. In addition to this showing, most of the mills have been enabled to largely reduce their debt.

The vast preponderance of the internal commerce of the United States, as contrasted with our foreign trade, was forcibly illustrated by Hon. Arden Speare, President of the Boston Chamber of Commerce, in an address delivered last week. He said: "The value of the products carried by our railroads alone in 1887 was \$13,043,250,000, or eight times as much as both imports and exports for that year, and the increase of this internal commerce for 1887 was \$1,660,000,000, or nearly 2½ times as much as our exports that year." Including coastwise traffic, from which foreign bottoms are excluded, the contrast would be still more startling.

The steel cruiser Baltimore was successfully launched on Saturday, and, on Saturday next the steel gunboat Petrel will be launched from the Columbian Iron Works, at Baltimore. The boilers and engines, built from designs furnished by the Bureau of Engineering, are all com-

pleted and will be put in place very soon after the ship is launched. The Petrel is of about 885 tons displacement.

The annual report of the Commissioner of the General Land Office to the Secretary of the Interior contains a statement showing that during the last four years a total of 83,158,990 acres have been restored to the public domain, and over 65,000,000 are recommended for restoration.

The resignation of T. B. Barry from the General Executive Board of the Knights of Labor is the third resignation among the general officers of the Knights of Labor within a few months. The first to go was General Secretary Litchman, and, after him, A. A. Carlton, a member of the board, who resigned last week. In parting Barry launches a bitter shaft at Mr. Powderly.

Thomas Hamilton, a successful wire manufacturer of Philadelphia, died suddenly on Saturday evening in that city, of heart disease. He was 68 years of age.

Justice Brown, of the Supreme Court, sustains the constitutionality of the McEvoy Grain Elevator bill.

Fine Magnetites in the Blast Furnace.

In response to an inquiry from the editor of the *Journal of the Charcoal Iron Workers*, E. S. Moffat, general manager of the Lackawanna Iron and Coal Company, Scranton, Pa., sends the following:

My experience has been chiefly with concentrated Chateaugay (Lake Champlain) ore, and we had so little trouble with it that I feel almost justified in saying that I do not know of any difficulties in its use, up to, say, 50 per cent. of the ore mixture, which is the most I have tried. We used some 10,000 tons of concentrated Chateaugay ore in our Scranton furnaces in 1887, and expect to use a much larger quantity this year. For the past two months (June and July), we have been running the four Scranton blast furnaces, which are in operation, on one-sixth concentrated Chateaugay ore. They have worked just as well as when we were using ordinary furnace ores, no increase of pressure, no irregularities and no trouble of any kind. A few days since I doubled the quantity of concentrated ore in use on our No. 1 furnace (73 feet high x 20 feet bosh), running it up to one-third of the ore charge. The only other change made was a slight decrease of limestone. The speed of the blowing engines and all other conditions being kept the same as before. I rather expected some increase of pressure at the tuyeres, but such has not been the case. The furnace was working well before the change was made, and has worked just as well since. No increase in pressure of blast. No decrease in the number of charges per day and no irregularities of any kind. The fuel used is one-fifth coke and four-fifths Lackawanna anthracite.

During 1887, we ran our No. 5 furnace (70 feet x 19 feet) for several weeks on 50 per cent. concentrated Chateaugay ore. When we made this trial I anticipated a considerable increase in pressure of blast, and in order to meet this increased the proportion of coke to one-third. I afterward concluded that this increase of coke was unnecessary, as the pressure of the blast went down considerably. The furnace worked well on 50 per cent. concentrated ore and showed no peculiarities. None of the concentrated Chateaugay ore is coarser than what will pass through a ¼-inch hole, and most of it very much finer. As different blast furnaces work differently, I would recommend parties commencing the use of concentrated magnetite to try a small proportion at first, say, one-twelfth, and then gradually increase.

MANUFACTURING.

Iron and Steel.

In answer to a report that the Glendon Iron Company, of Easton, Pa., were about to blow in a number of their idle furnaces, we received the following advices from the company, under date of the 4th inst.: "We are repairing two furnaces and have taken on what men were needed. We expect to blow in when ready. We are not booming very much, only shaking off a little of the dust which accumulated during idleness."

The condition of affairs at the various industrial establishments of Norristown, Pa., is reported to be highly satisfactory at the present time. Under date of the 5th inst. we are in receipt of the following advices from that place relating to improvements and changes which have recently occurred: "There is every indication that within a few weeks all the iron mills and furnaces in Norristown will be in active operation. Lucinda Furnace has been overhauled and its capacity increased. It will be put in blast at once. Last week James Hooven & Son dissolved, the senior partner remaining in the business, and on Tuesday the works resumed operations in all departments. A force of men is at work making alterations in the old and abandoned mill of the Standard Iron Company, which is to be fitted for the use of the Steel Car Wheel Company, organized recently. The company, it is said, will commence operations soon. The Stony Creek Iron Works have also resumed."

According to a recent issue of the *Sharon Herald*, the amount of money paid out as wages each month at the following named industries of New Castle, Pa., is as follows: Johnston's Sheet Mill, \$20,000; Etna Iron Works, \$20,000; Witherow's Works, \$12,000; New Castle Wire Nail Works, \$10,000; Crawford Iron and Steel Company, \$6000; Oliver Bros. & Phillips, \$5000; Baldwin & Graham's Stove Works, \$4800; Etna Furnace, \$4000; Raney & Berger Furnace, \$4000; New Castle Paper Mill, \$1000; total, \$86,000.

On Wednesday, the 3d inst., the head of the blast cylinder at the blast furnace of the Benwood Iron Works, at Martin's Ferry, Ohio, blew out. It will take a week to repair damages.

One of the Pittsburgh papers recently published a long statement to the effect that J. Painter & Sons, the well-known iron manufacturers of that city, had decided to abandon the manufacture of cotton ties, the reason given being inability to realize a profit owing to the low tariff on that product, which admitted of foreign competition. The facts in the case are, that the firm discontinued the manufacture of cotton ties several years ago, and have since been engaged almost exclusively in the manufacture of hoop iron.

It is stated that the Bethlehem Iron Company, of Bethlehem, Pa., have been compelled to close down a portion of their rail mill owing to inability to deliver steel rails ordered by Southern companies because of the yellow fever. No vessels can be chartered for the South until the yellow fever has abated.

James P. Witherow, engineer and contractor, of Pittsburgh, has just completed the erection of a pipe works for the West Superior Steel Company, at Duluth, Minn., which has a capacity for producing 200 tons of cast-iron pipe daily. The foundation has already been laid for a blast furnace to have a capacity of 200 tons per day, work on which has been suspended until spring next year. At that time will also be commenced the erection of a Bessemer steel plant, for which Mr.

Witherow also has the contract. The West Superior Steel Company is mainly composed of Western railroad men, and when their buildings are completed, which will be during the summer of next year, they will have one of the largest iron and steel manufacturing plants in the West.

Eliza Furnace, Eliza Iron Company, Wellston, Ohio, blew out last week, and will remain idle for at least the winter months.

Lucy Furnace No. 2, of Carnegie, Phipps & Co., Limited, at Pittsburgh, which has been out of blast for some weeks, will resume operations about the 15th inst. During the stoppage the furnace was relined and otherwise repaired.

The Forsman Malleable Iron and Cast Steel Company, have been organized at Louisville, Ky. The capital stock is \$30,000, and they will soon erect a foundry for making malleable or soft steel castings.

The Mayville (Wis.) furnace expects to be in active operation by the 10th inst.

Announcement is made that the Jefferson Iron Works, of Steubenville, Ohio, have decided to commence the erection of an additional blast furnace at an early date. It will probably measure 75 x 17 feet, and have a capacity of about 175 tons per day. It is expected the contract will be let in a few days and work be commenced on the furnace as soon as possible.

Star Furnace, Star Furnace Company, Jackson, Ohio, which banked in August for repairs, blew in October 1 after a thorough overhauling.

We are informed by Lean & Blair, engineers and contractors, of Pittsburgh, that the 20-ton Lash open-hearth steel furnace which they erected some time ago at the works of the Standard Steel Casting Company, at Thurlow, Pa., is working very successfully with producer gas, making heats in seven hours. The erection of this furnace to run on producer gas was an experiment, as all other furnaces erected by Lean & Blair are running on natural gas. The complete success of this experimental furnace leaves no doubt but that the Lash furnace can be operated with producer gas with as good results as when natural gas is used. Messrs. Lean & Blair have recently opened a branch office at 168 Washington street, Chicago, under the management of J. H. Reed & Co.

The new Gadsden Furnace of the Gadsden-Alabama Iron Company, at Gadsden, goes into blast the present week.

Miller, Metcalf & Parkin, the well-known steel manufacturers, of Pittsburgh, will add to their works a department for the manufacture of common steel. In the quality of their proposed new production the firm hopes to hold the same position they now occupy in the manufacture of fine steel.

The Keystone Rolling Mill Company, of Pittsburgh, are operating their plant double turn in all departments, except the plate mill, which is still idle. Pipe iron is the principal product.

No. 2 Sloss Furnace, Sloss Iron and Steel Company, Birmingham, Ala., blew in last week, and one of the North Birmingham furnaces will shortly follow suit.

The Jefferson Iron Works, of Steubenville, Ohio, has invited bids for the erection of a new blast furnace. It will probably be 75 by 18 feet, will have a capacity of about 150 tons per day, and will be operated in connection with the present furnace of the concern.

The new blast furnace now in course of erection by the Moorhead-McCleane

Company, of Pittsburgh, is almost completed, and will be ready for operation within the next 30 days. The stack is 90 feet high, while the bosh measures 18 feet. The cast house will be extended and a new stock house is to be built. A number of important changes are also being made in the rolling mill department by this firm. The blooming mill is being removed, and in its place a new train will be built. The blooming mill is thrown aside by an improvement, which dispenses with one process in converting the bloom into sheets. It is expected that a skelp mill and a merchant mill will be added to the establishment in the near future.

Fanny Furnace, at Shawnee, Ohio, operated by J. C. Hamilton, trustee, will resume operations in a few weeks. A new bosh has been put in, general repairs have been made, and a new brick casting house, 37 x 85 feet, is being put up to replace the old one, recently destroyed by a wind storm.

Copake Furnace, Copake Iron Works, Columbia County, N. Y., which shut down in August, has resumed operations.

The Prospect Rolling Mill Company, of Cleveland, have started business in the old Crucible Steel Company's Works, corner Garden street and the Cleveland and Pittsburgh Railroad. They will manufacture all grades of bar and horseshoe iron and steel tires. The capacity of these works will be about 60 tons daily. They have six furnaces, and they expect to have their works all in complete running order in 40 days.

No. 3 stack of the Phoenix Iron Works, Phoenixville, Pa., blew out on the 6th inst.

Sharon Furnace, at Sharon, Pa., formerly operated by Boyce, Rawle & Co., but purchased some time ago by Spearman, Colcord & Co., will in the future be known as Mount Vernon Furnace. It was put in blast last week.

The buildings for the plant of the Latrobe Steel Company, at Latrobe, Pa., will be made of wrought iron and will be fire-proof. The dimensions of the open-hearth steel department will be 250 x 80 feet. Connecting with it will be an L the same length and 40-foot span. The hammer-shops will be 350 feet long, with an 80-foot span, and will have an L the same length and 40-foot span. The company will manufacture tires for all kinds of wheels. About 300 men will be given employment.

The Detroit (Mich.) Iron Furnace was blown in last week.

F. R. Phillips, 407 Walnut street, Philadelphia, Pa., agent for the Solid Steel Company, Alliance, Ohio, reports the sale of a complete set of three-high solid steel nail plate rolls, 22 x 72 inches, to the Ellis & Lessig Steel and Iron Company, Pottstown, Pa.

Sheet mills Nos. 1 and 2, of Howe, Brown & Co., Limited, at Pittsburgh, commenced running 24 hours per day last week. The extra hours of work are rendered necessary by a large number of orders which the firm have recently received.

The Cleveland Rolling Mill Company, of Cleveland, Ohio, have purchased the barbed-wire plant of Billings, Taylor & Co., on Case avenue, and the machinery will soon be transferred to the mills of the company in that city.

The strike in the works of the Spang Steel and Iron Company, Limited, at Etna, Pa., near Pittsburgh, has been declared off by the Amalgamated Association. It commenced in July last when non-union men were employed in the Clapp-Griffith department of the works. The declaring of the strike off by the above-named

organization gives the firm a complete victory, as the only concession made by the firm was an agreement to take back as many members of the Amalgamated Association as places can be found for.

No. 1 furnace of the Cherry Valley Iron Works, Leetonia, Ohio, which has been idle for over a year, resumed blast on the 1st inst.

Machinery.

The partnership heretofore existing between Rees, Shook & Co., founders and machinists, at Pittsburgh, has been dissolved by the retirement of Levi Shook and W. G. Wilmot. The business will be continued by the remaining partner, Wm. M. Rees, at the old stand, No. 46 Water street, Pittsburgh.

The contract for engines, pumps and buildings at the Ridgewood pumping station, in Brooklyn, was awarded to the Washington Hydraulic Company, whose bid was \$198,471.

The Globe Foundry Company have recently been organized at Wellston, Ohio, with a capital stock of \$15,000. The new firm have purchased the foundry building recently erected by Spellacy Brothers, and will at once equip and put it in operation to manufacture all kinds of miners' supplies, such as cars, tools, &c., and make all kinds of engines, machinery, &c.

Eynon & Ingersoll, of Cleveland, Ohio, manufacturers of machinists' tools, are erecting a new works in that city on Lake street, 100x40 feet, three stories high, with an L on Kistland street 100x40 feet and two stories high. These buildings will be equipped with the latest improved machinery. The firm will carry on the manufacturing of milling machines, boring mills and shapers.

What is claimed to be the largest iron reservoir ever built is to be erected in Malden, Mass. The city has made a contract with the Cunningham Iron Works Company, of Boston, for the sum of \$20,940, to build a wrought iron reservoir to contain 1,158,000 gallons of water. It will be 75 feet in diameter and 35 feet high, and built of plate iron $\frac{1}{4}$ inch in thickness and of a tensile strain of 50,000 pounds per square inch of section.

The Erie Electric Motor Company, of Erie, Pa., have been granted a charter, with a capital stock of \$100,000. The shareholders are Wm. W. Reed and C. F. Allis, of Erie; S. T. Everett and E. B. Bangs, of Cleveland, Ohio, and J. S. Casement, of Plainville, Ohio.

The Shields & Brown Company, 240 and 242 Randolph street, Chicago, and 143 Worth street, New York, have just issued a very neat pamphlet illustrating and describing their sectional insulated air coverings for steam, gas and water pipes, drums, heaters, &c. The topics treated of are asbestos cement, asbestos materials, air-chamber coverings, elbow and valve coverings, economy of pipe covering, frost protective covering, hair-felt covering, train-pipe covering, &c. The method of constructing the different classes of coverings, and the manner of applying them, are very plainly illustrated, and the merits of the goods are set forth very convincingly. The pamphlet comprises 24 pages, tastefully covered with blue paper.

The Hill Clutch Works, of Cleveland, Ohio, are remodeling and greatly enlarging their plant, putting in new engine and boiler and considerable new machinery.

The Cochrane Roller Mill Supply Company, of Dundas, Ont., are rapidly completing their new works at Escanaba, Mich. They will have their own foundry for making iron castings. They expect to employ 1000 men when in full operation.

By a method which they have perfected they claim to be able to run a 200-barrel flour mill with a 7-inch belt in place of an 18-inch belt heretofore required for such service.

The September sales of boilers by the Babcock & Wilcox Company, of New York, amounted to 16,200 horse-power. This is probably the largest horse-power of stationary boilers ever sold by one firm in that length of time.

The Standard Tool Company, Cleveland, Ohio, are erecting new works on Garden street and C. & P. R. R. The main building will be three stories high and 165 feet long. There will be a separate boiler and engine house, with one-story building attached, 116 x 25 feet; also one-story office and warehouse, 85 feet long by 32 feet wide. The company do not expect to occupy the new works until the beginning of the year. The fact that their present quarters are inadequate for their increasing business is the reason for the erection of these new works.

Hardware.

The Anthony Wayne Washing Machine Company, Fort Wayne, Ind., are producing their well-known "Washer" at the rate of 40 machines per day, and the company are diligently at work upon patterns for a new Washer, which, it is expected, is to be put upon the market within the next 60 days. Their sales up to the present time, although only the second year of their organization, have reached over 8000 machines.

The Enterprise Mfg. Company, Akron, Ohio, under recent date, advise that they have just completed a two-story brick factory building, 30 x 60, and improved the two buildings already occupied by them, making in all three factories in their Akron plant, arranged so that each building is fire-proof, and giving a floor space of two acres devoted to the manufacture of their patented specialties. They are also putting in one Huyett & Smith Mfg. Company's largest size hot blast heaters to heat the different buildings and departments with hot air. Among the new additions to their line of goods is mentioned a sweat pad factory to their harness specialty department, possessing a number of improvements over other styles, particularly in the collar fastener device and for the cork filling used; the pad is medicated. A large trade has been worked up on these goods, while the trade on luminous goods is on the constant increase.

The Horton Mfg. Company, Fort Wayne, Ind., are turning out the Wayne Washing Machines at the rate of 80 per day. The trade on their Superb Corn Planter has been very fair. The company have made an addition to this useful device in the form of an interchangeable plate or disk for planting sorghum or broom corn seed when desired. The change can be made instantly.

We are advised that the Le Page Glue and Cement Company, Gloucester, Mass., have added to the plant twice during the year, and are now putting in a 5-ton digester, which, together with other improvements, will double their present capacity.

Miscellaneous.

In answer to a report that the Nimick & Brittan Mfg. Company, of Pittsburgh, had notified their employees of a 10 per cent. reduction in wages, to take effect on the 15th inst., we are advised that there is no truth in the rumor whatever. The report that a change would also be made in the management of the firm is likewise untrue.

A press dispatch from Beaver, Pa., under date of the 23d ult., says: "On account of the great diminution of the nat-

ural-gas supply of the Sheffield district, the Bridgewater Natural Gas Company have decided not to pipe gas to Youngstown, Ohio, hereafter, but to devote all their energies and capital to the Beaver Valley. The pipe line to Youngstown, laid two years ago at a cost of \$650,000, will be taken up and made to do service as a main from new wells which the company will drill.

T. William Harris & Co., 44 Broadway, New York, have been awarded the contract for extending the Dobbs Ferry and Hastings Gas Works. New pipes will be laid at both Dobbs Ferry and Hastings.

Licenses to incorporate under the laws of Illinois have been granted to the following companies: The Dieckmann Electrical Company, at Chicago; capital, \$100,000; for the manufacture of electric machines and apparatus; incorporators, G. F. Dieckmann, Christain Wahl and David Quigg. The United States Oil and Gas Stove Company, at Chicago; capital, \$100,000; for manufacturing; incorporators, E. B. Hamlin, H. J. Baker and J. B. Payne. The Lehner, Johnson, Hoyer Mfg. Company, at Chicago; capital, \$75,000; for the manufacture of metallic and earthenware goods; incorporators, J. H. Lehner, J. H. Johnson, F. A. Hoyer, T. M. Kent and C. D. Street. The Montague-Woodrough Saw Company, at Chicago; capital, \$50,000; incorporators, G. Montague, R. L. Woodrough and H. A. Leland. The Steele Heater Mfg. Company, at Chicago; for the manufacture of all kinds of machinery and appliances for lighting and heating; capital, \$1,500,000; incorporators, Wilbur F. Steele, William Grimshaw and J. M. Labold. The Tubal Cain Brass Mfg. Company, at Chicago; capital, \$75,000; for the manufacture of brass, iron and copper goods; incorporators, J. H. Lehner, J. H. Johnson, F. A. Hoyer, T. M. Kent and C. D. Street. The Cumberland River Iron and Mfg. Company, of Chicago; capital, \$1,000,000; incorporators, William A. Gardiner, Frank B. Dyche and Frank F. Reed. The Chicago Steel Rail Company, of Chicago; capital, \$200,000; incorporators, Samuel W. Adams, John Good and William A. Hinkins. The Seamless Fibre Ware Company, of Chicago; capital, \$20,000; incorporators, L. C. Rigg, Eber Hubbard and Chas. S. Burton.

We are informed that the Cleveland Silver Metal Company, Cleveland, Ohio, are intending to offer at public sale their whole franchise, including factory, machinery, tools, &c. The company began business about one year ago, manufacturing a new white metal, which they termed "silver metal," in sheets and bars for the trade, and also a line of spoons and forks from this metal, which were put upon the market under the brand of "Silver Metal." The factory is a two-story frame building, 35 x 120 feet, boiler-house one-story frame, 32 x 28 feet, with stone floor, containing one 45 horse-power engine and two boilers; also annealing-house, 32 x 28 feet, and annealing furnace, foundry, one story, 36 x 31 feet, 40-foot brick stack and seven furnaces. The factory is heated by steam, and has the modern conveniences in the way of machinery, &c., for making spoons, forks, &c. The convenience of the location and the fact that the plant is in good order and offered on favorable terms are alluded to.

Recently an axle specification was given out which was particularly rigid. A specimen, $\frac{1}{4}$ inch x 1 inch, cut from the finished muck axle, was to show a tensile strength of 49,000 pounds, an elastic limit of 26,000 pounds, and an elongation of 15 per cent. in 8 inches. A specimen must bend cold 180° to a curve, the inside diameter of which is $2\frac{1}{4}$ times the thickness of the piece.

The Iron Age

New York, Thursday, October 11, 1888.

DAVID WILLIAMS, - - - PUBLISHER AND PROPRIETOR.
CHAS. KIRCHHOFF, JR., - EDITOR.
GEO. W. COPE, - - - ASSOCIATE EDITOR, CHICAGO.
RICHARD R. WILLIAMS, - - HARDWARE EDITOR.
JOHN S. KING, - - - BUSINESS MANAGER.

Uniformity in Railroad Classification.

The letters of Chairman Cooley to our Western railroad managers, which we noted in our columns last week, bear upon a subject of importance to all shippers of freight. An amendment to the Interstate law has been introduced into the House, making it compulsory upon the Interstate Commission to arrange a uniform classification for the whole country. This, with other proposed amendments to the Interstate act, is not likely to become law this session, but it emphasizes the chairman's reasoning that unless the railroads make more efforts in this direction, Congress will take the matter into its own hands.

The present confusion in our practice is the source of much annoyance to manufacturers and merchants. As it now stands a shipment to any point outside the bounds of a traffic association is governed by one classification within those bounds and by another and very different one beyond. A through rate under these circumstances is a matter of some little difficulty, whereas such knowledge should be within easy reach of shippers. Because the fourth-class rate is known from shipping point to destination it does not follow that this is the real rate upon an article, because of differing classifications. Thus we have the Official, the Western, the South railway and steamship, the Illinois, the Texas, the Transcontinental classifications, while any merchant's shipments may run into two or more association territories. In these days when the transportation charges make so large a part of the value of an article, such uncertainty is a grave obstacle to perfect commercial freedom and distribution.

On the other hand, the present condition of things is an outgrowth of our national circumstances. Much of the classification confusion previous to April, 1887, was unnecessary, but complete uniformity can be obtained only by the sacrifice of other advantages. The extent of our country is such that we find the greatest diversities in production. In agriculture, Arctic wheat and tropical fruits demand attention; coal mines and ore beds are widely separated. These must be brought together and their exchanges arranged for by our railroads. Thus the classification of oranges and melons is a matter of vital interest to one section, while another has its attention fixed solely on manufactures. It would be unjust to apply the low rate made on coal by the great coal-carrying roads of Pennsylvania to the Western lines. Rigid uniformity is indeed desirable, but the question is an important one whether the shipping public are ready for the readjustment and the consequent leveling up which would take place. Each article would take an average place, a mean between the low classification of our section and the high of another. While if some

particular article should clearly take a lower rate than that given to it, the railroads might, with a show of justice, say that they could not put this article in a lower classification, because other sections of the country, not interested, objected; nor could they reduce the rate itself because it would apply to all the items in that class, many of whom did not need any reduction. It is easy to see how many established interests would be affected, while it is a question whether the shipping community would as a whole be one whit better off, for it may be set down as an axiom that our railroad men will try to secure their average net earnings in any event.

There is one loophole of escape—by a system of commodity rates, such as are made freely west of Chicago and such as we find in the official classification on iron and iron manufactures. Under this plan the general classification throughout the country would be made on the compromise system, while each section would obtain special rates on its special products by commodity rates. It is true that this would cause nearly, but not quite, the same annoyance as now, for no merchant could be sure of a through rate without consulting all the commodity exceptions, and we would thus be changing the form of our differing classifications, but not their substance; yet the gain though slight would be something. Every one could go through the exceptions more quickly than through a number of classifications.

If commodity rates should be forbidden and cast-iron uniformity be insisted upon, we look for many protests. The products of the different sections demand and should receive special consideration.

The Blast Furnaces on October 1.

The encouraging outlook for the pig-iron industry has had its influence upon the blast furnace capacity now actively at work. The anthracite furnaces are well employed, but show no marked increase over the capacity of September 1. A few more furnaces have begun work or are preparing to do so, among them the Charlotte, Glendon, Temple and Edge Hill, but it is likely that, on the other hand, some stacks now at work will be found to blow out for repairs. The coke furnaces exhibit greater activity and promise further increase.

Turning to the anthracite furnaces we have the following:

Anthracite Furnaces, October 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	26	9	2,995	17	3,874
New Jersey.....	15	4	1,423	11	3,394
Spiegel.....	3	3	238	0	0
Pennsylvania:					
Schuylkill Valley.....	35	17	5,191	18	3,690
Lehigh Valley.....	48	26	9,130	20	4,756
Spiegel.....	1	1	43	0	0
L. Susquehanna Valley.....	23	12	5,078	11	2,642
Lebanon Valley.....	15	14	8,808	1	400
U. Susquehanna Valley.....	18	9	2,822	9	1,630
Maryland.....	4	0	0	4	462
Total.....	186	95	33,728	91	20,938

Practically, therefore, the capacity has remained stationary, nor have we any reports that indicate a notable increase for

the current month. For a year past our records show the following:

	Furnaces in blast.	Capacity per week.
October 1.....	96	33,728
September 1.....	92	33,541
August 1.....	93	33,397
July 1.....	92	32,478
June 1.....	99	32,418
May 1.....	96	31,003
April 1.....	94	30,496
March 1.....	98	28,568
February 1.....	97	29,989
January 1.....	118	38,206
December 1, 1887.....	122	39,487
November 1.....	124	40,028
October 1.....	123	39,440
September 1.....	125	38,338
August 1.....	129	37,930
July 1.....	138	40,742

Among the anthracite furnaces the only change in New York is that Charlotte may blow in this month. In New Jersey Musconetcong is running. In the Schuylkill Valley Lucinda and Edge Hill have probably begun work at this writing, while Mount Laurel, which is putting in a new bosh and lining, is expected to blow in between the 15th and 20th of this month, and Temple is preparing. In the Lehigh Valley Lehigh Furnace went out early in September. In the other districts there have been no changes at all.

The position of the coke furnaces on the 1st of this month was as follows:

The Coke Furnaces October 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	3	1	982	2	1,832
Pennsylvania:

Ohio:					
Mahoning Valley.....	14	11	8,071	3	2,140
Central and Northern.....	17	14	9,490	3	1,310
Hocking Valley.....	14	5	1,531	9	1,990
Hanging Rock.....	11	7	1,580	4	908
Indiana.....	2	1	174	1	249
Illinois.....	13	9	9,908	4	3,120
Michigan.....	1	0	0	1	250
Wisconsin.....	4	1	502	3	2,011
Missouri.....	6	1	436	5	2,136
Colorado.....	1	1	465	0	0
The South:					
Virginia.....	11	8	3,678	3	1,868
Kentucky.....	4	4	977	0	0
Alabama.....	17	13	6,955	4	2,680
Tennessee.....	10	8	3,474	2	897
Georgia.....	2	1	501	1	239
Total.....	207	137	85,461	70	22,630

	No. of furnaces.	Capacity per week.
October 1st, 1888.....	137	85,461
September 1.....	133	81,082
August 1.....	122	74,835
July 1.....	121	69,543
June 1.....	128	75,427
May 1.....	130	75,815
April 1.....	128	70,644
March 1.....	128	68,862
February 1.....	136	73,912
January 1, 1888.....	143	83,101
December 1, 1887.....	144	88,835
November 1.....	151	90,459
October 1.....	152	89,123
September 1.....	145	83,124
August 1.....	113	62,061

The increase is principally due to greater production in the Pittsburgh district, the Shenango, Youghiogheny, Allegheny and Mahoning valleys, Central and Northern Ohio and the South.

In New York Troy has blown out one of its furnaces. In the Pittsburgh district Clinton, formerly owned by Graff, Bennett & Co., has been started by the syndicate of creditors who purchased the plant some time since, and is making between 40 and 50 tons of iron per day. The repairs on Edith are almost completed, and it will be making iron in this month. Lucy No. 2 is expected to be ready on the

15th inst. It is believed safe to state that every furnace in Allegheny County will be in blast not later than November 15. In the Shenango Valley Florence is idle till November 1, but Rosena and Mount Vernon are at work. In the Youghiogh eny Valley Charlotte is at work and Rebecca has resumed. In the Mahoning Valley production is active, the output in September having aggregated 34,591 tons, Himrod, now leased to the Mahoning Valley Iron Company, having been added to the list. Among those furnaces grouped as those of Central and Northern Ohio, Seneca is at work, and Cherry Valley No. 1 is probably now blowing. In the Hanging Rock Eliza has stopped for an indefinite period and Alice is out. Star, which was banked during September, is running again. In the Hocking Valley Crafts began work on the 5th ult. In Wisconsin Mayville is probably blowing at this writing. In the South No. 2 Sloss has resumed, and one of the new North Birmingham stacks is to be lighted at an early date. In Tennessee Sewanee has resumed, while one of the South Pittsburg furnaces has blown out.

Growth of Lake Commerce.

The shipping interests of the country are not dead. On the contrary, the latest statistics of the Commissioners of Navigation afford gratifying evidence of a revival. But the improvement is mainly in the commerce of the great Northern lakes, where iron shipbuilding has received a strong impetus during the past year. The exhibit of the commissioners is as follows, for the first six months of 1887 and 1888, in comparison:

Comparative Statement of Number and Tonnage of Vessels Registered During the Six Months Ending September 1, 1888, and September 1, 1887.

STEAM VESSELS.			
Division—	1888.	1887.	
No. Tonnage.	No. Tonnage.	No. Tonnage.	
New England.....	25 5,647	21 4,188	
Mid. Atlantic and Gulf.....	79 13,335	71 20,964	
Pacific Coast.....	44 10,026	32 4,113	
Northern Lakes.....	120 82,550	71 49,224	
Western Rivers.....	44 6,004	42 5,872	
Total.....	312 117,612	237 84,362	
SAILING VESSELS.			
Division—	1888.	1887.	
No. Tonnage.	No. Tonnage.	No. Tonnage.	
New England.....	65 12,796	58 10,877	
Mid. Atlantic and Gulf.....	130 3,302	130 4,206	
Pacific Coast.....	39 6,790	24 3,734	
Northern lakes.....	35 9,610	22 2,055	
Total.....	269 32,498	234 20,872	

Taken as a whole the foregoing is cheering and full of encouragement. To most readers it is a revelation, the average tonnage having increased during the six months covered by the statement from 105,234 tons in 1887 to 150,110 tons in 1888, or at the rate of about 33 per cent. per annum, and the aggregate number of vessels rises from 471 to 581 in the period mentioned. The most notable fact, however, is the increasing activity on the lakes, as appears from the following statistics of the number and tonnage of vessels built on the lakes for six months, ending September 1, 1888 and 1887:

	1888.	1887.	
No. Tonnage.	No. Tonnage.	No. Tonnage.	
Steam vessels..	120 82,550	71 49,224	
Sailing vessels	35 9,610	22 2,055	
Totals.....	155 92,160	93 51,279	

Hence it follows that of the total increase of 110 vessels, of 44,876 tonnage, not less than 62 vessels, of 40,881 tonnage, was in

the lake department. Shipbuilding on the Pacific Coast meanwhile more than doubled. On the other hand, in the middle Atlantic and Gulf divisions there was a heavy decline.

At the present juncture a cursory review of the principal facts relating to the important traffic springing up on our northern border is not inopportune, especially while our commercial relations with Canada are under discussion, and while Congress is making further appropriations for the improvements at the gateway of Lake Superior, known as the Sault Ste. Marie Canal and the St. Clair Flats. The tonnage employed on the chain of Northern lakes, stretching from the Atlantic to the heart of the continent, as we have seen, is expanding by leaps and bounds. From New York to the head of Lake Superior is 1400 miles, and beyond is the vast agricultural region under the British flag, nearly 1000 miles square and capable of a boundless production of cereals, which is forming connections with the American railway system, and will contribute to the volume of commerce passing through the lakes, steadily augmenting as the years roll on. Although the Canadians have expended about \$40,000,000 on public works, exclusive of the \$100,000,000 or upward absorbed in building the Canadian Pacific Railway, confident of their ability to control the traffic of the Northwest, it is found in practical experience that "the up-cargo is the life of the trade." In other words, vessels navigating the St. Lawrence River are unable to command the cargoes of coal from the States, and other miscellaneous merchandise for the westward trip which are essential to a profitable voyage in conjunction with the coal and ores received in return. Herein it would appear there has been a serious miscalculation. One writer says: "The Canadians have spent about \$40,000,000 in digging canals to accommodate this traffic, and still it resolutely refuses to go down the St. Lawrence River. They can fling \$50,000,000 or \$150,000,000 additional, if they can borrow so large a sum from credulous Englishmen into their canals and river improvements, and they cannot divert one bushel of grain from Buffalo, the Erie Canal and New York."

The growth of the traffic on the basis which now seems to have become established is marvelous. In 1855, when the first lock at Sault Ste. Marie was opened for business, 100,000 tons of iron ore and copper passed through, and five years later the amount was increased to 400,000 tons. In 1875 the amount was 1,260,000 tons, supplying one-third of the ore for the total pig iron production of the United States, and the necessity for another structure of larger capacity for the accommodation of traffic was clearly demonstrated. The additional lock now in use, a noble specimen of engineering, 575 feet in length, was opened for business in 1881, and it was calculated that the saving in the cost of iron ore transportation alone, from Lake Superior was \$800,000 in the following year. Seven more years have passed and again there is a demand for enlargement. Works at the present time only fairly begun are estimated to cost nearly \$5,000,000, exclusive of a dry dock in contemplation.

A recent special report by Gen. O. M. Poe, relative to the St. Mary's Falls Canal,

shows that 5,494,649 tons of freight passed through it last season, and that the freight charges amounted to \$10,075,153. The charge by rail would have been as \$11 to 183, effecting a saving of \$34,557,140 for the single season, or fully \$40,000,000 if freight rates were raised to where they naturally would go if it were not for the water route. It would be difficult to set bounds to the ultimate growth of the trade of the Northwest. Is there no hope that our ocean marine will share likewise in the prosperity of the great republic?

Coke Pig Iron at Chicago.

The coke pig-iron trade of Chicago has recently fallen largely under the control of local producers from a variety of causes. When the demand for steel rails was very active, the Chicago rail makers absorbed not only the entire production of their own blast furnaces, but they also placed contracts for Bessemer pig iron with outside furnace companies at Chicago and other points within reach, even purchasing charcoal pig iron in excess of the quantity they were required to use in making rails for some of their most exacting customers. This year the condition of the Western steel trade has so changed that comparatively little Bessemer pig iron has been purchased from outside producers, and some of the furnaces connected with rail mills have been turned on pig iron for sale. The local supply of foundry and mill pig iron was thus so augmented that for a time the price of coke pig iron in Chicago was relatively lower than in any other Northern center of consumption. The low price then established was continued for some time, after the demand for pig iron in other localities had considerably diminished the quantity of competing iron offered at Chicago, thus giving the local producers a still stronger hold on their home market. Notwithstanding the increased production of foundry and mill pig iron at Chicago and in its vicinity, by the furnaces formerly largely employed in making Bessemer pig iron and the new Mayville furnace in Wisconsin, the consumption is now sufficiently heavy to absorb all of it, and to enable the producers to mark their prices up, so that they are more nearly on a par with the competing iron from other sections. Soft coke pig iron, of course, retains its hold upon the Chicago market, not being disturbed by the native product, but other coke irons certainly appear to be almost shut out, and will continue in that condition until either the steel-rail trade resumes its old-time activity, or their prices are forced much lower than now seems probable. The advantages presented by Chicago for the location of blast furnaces to make pig iron for the general market were never so thoroughly established as they have been by the recent events herein set forth. With the constantly growing consumption of iron in that city and its tributary country, it will be remarkable if the number of blast furnaces is not increased in the early future.

Attention is directed every now and then to the use of steam as a means of extinguishing fires, and its advantages, in point of convenience and efficiency, over other methods, are frequently given prom-

inence. As a matter of fact, however, some of the conditions essential to success are, by some, persistently ignored, and it is not surprising, therefore, that there should be instances where the method has failed completely. In order that it may be successful the space in which the fire is burning should be inclosed, so that free access of air should be cut off, and steam under pressure and in ample quantity should then be let into the apartment. The efficiency of the steam in extinguishing the fire is easily explained, being due to the fact that the vapor displaces the air, and, with it, the supporter of combustion, atmospheric oxygen. If these circumstances were given due weight there would be less disappointment and fewer heavy losses where steam jets are depended upon for fire protection. A year or two ago, we believe, reports of experience in Germany with the steam-jet method recorded decidedly unsatisfactory results and inquiries were frequent as to the exact conditions under which it was practiced in American mills, where it was known to have done very good service. The whole secret of success, however, if such it be, is in the correct application of the principles which we have stated.

The Position of Tin.

On June 27, the lowest price for Tin after the collapse was reached in the London market, £75. 12/6, and in our own, 17 cents. Since then the tendency has been gradually upward, till on September 18th London had risen to £104. 15/, and New York to 23½ cents. Then a downward course set in, depressing London to £100 last week, but recovering at the close to £101. 5/. The extreme advance during the short period of 83 days had consequently been nearly 40 per cent. Great impetus was given to the demand by the reduction in price after the speculative boom came to an end, and on the other hand there is a prospect of more abundant supplies. It would appear, therefore, that the price of £100 is quite high enough, if not too high, to be justified by the actual situation. The statistics of October 1, indeed, proved to be by no means favorable; the visible supply in Europe and America had been reduced but little during September, being 12,451 tons on October 1 as compared with 12,740 on September 1, and 11,907 on October 1, 1887. Apart from speculative causes, the subsequent return to £100 was, therefore, nothing but natural. In our own market the decline in London has exercised but little influence, available tin being scarce, so that even a limited consumptive demand suffices to sustain the price of 23½ cents on the spot. At the considerably increased value a great impulse has been given to the output of tin in all producing countries, in the Straits, notably, but, on the other hand, the stocks in the hands of dealers have everywhere, it would seem, dwindled to a minimum; hence, even a more abundant supply from the East in the near future may be absorbed without much difficulty. Present values may be tolerably well sustained, unless operators for a fall, through manipulations of their own, succeed in temporarily engineering a drop of some moment.

September shipments from the Straits to this country were unusually large—750

tons, against 450 last year; to England they were 1300, against 1200 tons. Since January 1 they have been 15,900 to both countries taken together, as compared with 14,000 during the first nine months of last year. The opening of the wool season in Australia usually leads to freer tin shipments, hence from now forward larger amounts may be expected from that quarter, too. In Holland September commenced with the following stocks:

	1888.	1887.
Banca stock, slabs.....	147,036	99,170
Billiton ".....	13,468	14,333
Banca afloat ".....	4,000	2,900
Billiton ".....	45,000	47,000
Totals.....	209,504	163,403

As for the activity in general trade on this side, and the influence it may still have on tin between now and the close of the year, it may be believed that the bulk of the fall business has been done, and, the Presidential election drawing near, it will terminate after a couple of weeks. Nor can the last two months of the year be depended upon to bring much trade, either in tin or the metal branch generally. In Europe business is only fair. Any extraordinary amount of buying in any branch for actual consumption need not be expected during the last quarter of the year. Tin will therefore have to stand on its own merits. It is not overabundant in actual stock anywhere except in Holland, but the amounts afloat are liberal, and they would be too much so but for the light holdings of dealers. At £100 tin, under the circumstances, cannot be called cheap, but at the same time, in spite of the nearly 40 per cent. recovery, it cannot positively be called dangerously dear.

The statistics of production for the first six months of this year, just issued by J. S. Jeans, the secretary of the British Iron Trade Association, confirm the reports of an improvement in trade independent of a demand from this country. The output of pig iron for the first six months of this year was 3,902,804 gross tons, as compared with 3,773,812 tons for the second half of 1887 and 3,668,115 tons for the first half of 1887. Stocks have declined 41,615 tons, leaving them 2,673,860 gross tons, so that the apparent consumption, deducting exports, was 3,442,686 tons, as compared with 3,043,925 tons during the first half of 1887, an increase of 398,761 tons. The report covering the production of Bessemer steel ingots points in the same direction. For the first half of 1888 the output was 1,051,481 gross tons as compared with 915,554 tons in the first half of 1887, an increase of 135,926 tons, South Wales showing the greatest development—from 244,159 tons to 311,468 tons. The rail product developed little improvement, the increase being from 445,785 tons for the first half of 1887 to 487,174 tons in the first six months of the current year, so that, evidently, the greater demand for Bessemer steel was for miscellaneous shapes. This is confirmed by the extraordinary development of open-hearth steel, showing a growth of nearly 50 per cent. this year over last, the figures being 405,390 tons for the first half of 1887, and 616,421 tons for the corresponding period of this year. Scotland leads with 151,416 and 223,192 tons, respectively, the Northeast Coast following with 75,023 and 141,103 tons, South Wales with 80,290 and 131,703 tons.

It may be stated that Mr. Jeans reports that 223½ furnaces were employed, 47½ unemployed, and that 30 are under construction.

By way of comparison we may submit the following.

Production of Iron and Steel, Six Months, Gross Tons.

	United States.		Great Britain.	
	First half.	1888.	First half.	1888.
Pig Iron.....	3,043,295	3,020,092	3,668,115	3,902,804
Bessemer Steel Ingots.....	1,462,118	1,235,971	915,554	1,051,481
Bessemer Steel Rails.....	1,021,500	962,197	445,785	487,174
Open-Hearth Steel Ingots.....			405,390	616,421

We are not in possession of the statistics of open-hearth steel production for the periods under review. Possibly they might make an exception to the rule that there has been a falling off in this country where there has been an increase in Great Britain.

The British Admiralty has just issued regulations which, it is expected, will remove to a great extent the danger of serious explosions in the coal bunkers of vessels of the navy. In past years it was the practice, we believe, to conduct the coaling of British war ships from wharf stores which contained coal that had been for some months exposed to the action of the atmosphere, and which thus had been given opportunity to part with much of its gas. At the expense of using coal which had been allowed in this way to deteriorate, British ships enjoyed reasonable immunity from gas explosions, until more recently a number of accidents of this kind in quick succession, brought about very probably by a departure from the usual method of securing coal supplies, suggested the fitness of some inquiry on the subject. In the new regulations, accordingly, special stress is laid on the fact that in supplying ships the coal should be kept as dry as possible, moisture in some cases being conducive to a rapid development of heat and gas, and in washing down the decks after coaling the bunkers are consequently to be tightly closed. Attention is further directed to the necessity of maintaining good ventilation of the bunkers, and as a last measure of safety the use of naked lights in these is strictly prohibited unless the absence of gas has been definitely assured by direct test. With an efficient system of ventilation, and an even moderate exercise of care, it is difficult to explain why a serious explosion should occur, and future accidents will have to be inquired into chiefly with the view to exposing carelessness in management.

A Coke-Crushing Machine.—The J. M. Schoonmaker Coke Company, of Pittsburgh, have recently placed in one of their works in the Connellsville region a new coke-crushing machine, of which the following is a brief description: In place of the coke passing through a revolving shaft, as is the case with the coke crushers now in operation, with the new crusher it will pass over a number of screens so arranged that all the dust will be kept out of the coke. The different sizes will fall into bins ready for shipment, entirely free from any dust whatever. In passing over the screens and through them the arrangement is such that the coke will not be subject to the friction that is unavoidable in passing through a revolving shaft.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., October 9, 1888.

The Senate has at last launched its tariff bill upon the sea of discussion. An effort to limit general debate to ten days was declined by the Republicans, who, while they may not consume more than that amount of time, did not wish to bind themselves by agreeing to a fixed date. After general debate shall have ended, the consideration of the bill by paragraphs for amendment will consume much more time. The prospects of reaching a vote before the election are, therefore, not at all flattering.

It is most likely, on the authority of Senator Allison, that about the time the end of general debate shall have been reached the Senate will be willing to consider a proposition from the Democrats to take a recess. If at all, this time will be about the 25th of the present month. The Democrats are much divided upon the question of taking a recess. Speaker Carlisle said to-day that he supposed that everything was agreed to when he discovered that Representative Breckenridge and a few others were opposing the movement, and threatened to demand a quorum if an effort were made to force the passage of a joint resolution to either take a recess or to adjourn. Therefore, matters stand as they were a week ago, and will so remain for at least ten days, when the attempt to come to an understanding about getting away will be renewed.

The majority report of the Senate Committee on Finance is one of the ablest, most comprehensive and satisfying and instructive documents on the subject of the tariff which has been issued. It was under the personal supervision of the subcommittee, Messrs. Allison, Aldrich and Hiscock, assisted by the clerk of the committee, Benjamin Durfee, and the statistician and computer, Mr. Evans. The interesting comparative and statistical data conveys much valuable information. The following is a list of some of the manufactures which the Senate Committee charge would be seriously affected by the reductions proposed in the House bill:

Manufactures of cotton.
All manufactures of wool.
All manufactures of hemp, flax and jute.
Paper envelopes and other manufactures of paper.
Steel railway bars.
Manufactures, articles and wares of iron, steel and other metals.
All manufactures of manila, sisal grass and other vegetable fibers.
China, porcelain, parian and other wares.
Common window glass and the manufactures of glass.
Lead products.
Paints and colors.
Iron and steel rivets, bolts, &c.
Wrought-iron and steel spikes, &c.
Horse, mule and ox shoes, &c.
Cut tacks, brads and sprigs.
Horseshoe, hob and wire nails, &c.
Boiler and other tubes.
Chains of all kinds.
Files, file blanks, rasps, &c.
Iron and steel beams, &c.
Lead in ore and in pigs.
Needles.
Metallic pens.
Type-metal.
Blacking of all kinds.
Manufactures of gutta-percha, hard rubber, &c.
Manufactures of hair.
Ink of all kinds.
Brushes of all kinds.
Marble sawed and dressed, and manufactures of marble.
Manufactures of papier-maché.
Philosophical instruments and apparatus.
Webbing composed of cotton, flax and other materials.
Zinc, dry and ground in oil.
Confectionery of all kinds.

The committee estimate the value of the annual product of these industries to be at least \$2,000,000,000, and that in their prosecution employment is given to not less than 1,250,000 persons, while at least 5,650,000 are directly dependent for support on their continued existence and prosperity.

As showing the inconsistencies of the House bill the report charges that in the metal schedule tin plates, or iron and steel sheets coated with tin or lead, are placed on the free list; while iron ore and pig iron, as well as the iron bars or steel billets and slabs from which these sheets must be rolled, are dutiable at from 45 to 60 per cent. ad valorem. A duty is also placed by the bill on common black sheet iron of from 1 to 1.4 cents a pound, and iron and steel sheets, when galvanized with zinc or coated with any other metal except tin or lead, are required to pay an additional duty of from $\frac{1}{4}$ to $\frac{1}{2}$ cent a pound above these rates. There is also a duty levied of $\frac{1}{4}$ cents a pound upon pig lead.

Iron and steel cotton ties and hoops for baling or other purposes, not thinner than No. 20 wire gauge, are made free; while other hoop, band, or scroll iron is dutiable at rates varying from 1 to 1.3 cents a pound, and an additional rate of $\frac{1}{4}$ cent a pound is levied on articles wholly or partially manufactured from hoop iron. The iron bars or steel slabs from which cotton ties or hoops must be manufactured are dutiable at from 45 to 60 per cent.

Needles are placed upon the free list, while the duties on steel remain unchanged at not less than 45 per cent. ad valorem.

The report shows that the tendency under protection is to the judicious extension of the free list.

The percentage of importations of free and dutiable articles under the various tariffs which have been in existence from 1846, inclusive, is shown by the following table:

Period.	Dutiable. Per cent.	Free. Per cent.
1847 to 1857.....	88	12
1858 to 1861.....	78	22
1879 to 1883.....	70	30
1884 to 1887.....	66	34

It will be seen that with protective legislation, the report says, we have had a much larger and constantly increasing amount of free importations. The protective policy contemplates the free admission of all non-competing articles and of all those in the production of which the benefactions of nature have given other countries permanent advantages over our own.

The operations of the Senate bill are summarized as follows: Importations, 1887, values, \$425,082,497; duties, \$204,477,083; estimated imports under the Senate bill, \$397,236,606; duties, \$168,607,645; estimated decrease by Senate bill, \$35,869,437; average ad valorem rate of duty present law, 48.21; proposed bill, 42.45.

In this aggregate metals bear the following relation: Importations, 1887, \$57,784,719; duties, \$23,090,797; estimated imports under the Senate bill, \$51,402,136; duties, \$21,376,664; estimated decrease of duty by Senate bill, \$1,714,132; average ad valorem rate of duty present law, 39.96; proposed bill, 41.58.

An interesting comparative statement is given, showing articles of domestic productions, by sections, and how affected by the House bill. It aims at showing that that measure was devised in hostility to the industries of the North. The comparison is additionally valuable as showing the industrial activity of the two sections. The tariff debate will now run its course for some days. A number of Senators on both sides have speeches to make which will have more or less campaign effect.

The Springfield Iron Company, of Springfield, Ill., have established a branch office in St. Louis, which will be located in Room 164, Laclede Building. It will be in charge of Albert Waycott, formerly connected with their New York office, and also with the Troy Iron and Steel Company.

Underground Forts in Belgium.

In a recent number of *La Nature* Colonel Hennebert, of the Belgian army, describes underground forts which have come into use in Belgium, as one of the principal methods of national defense. One of these underground forts is like an enlarged molehill, and is built of concrete. Measuring 50 m. in length by from 30 to 40 in width, it is about 12 m. below the surface of the ground, and its greatest height above the earth is no more than 3 or 4 m. It presents the appearance of an elliptical cap placed on the ground, and is scarcely visible to the eye of an observer. At the center of this artificial rock are three armored towers, each with two heavy guns. There are also four small forts, which are pulled in and run out at pleasure, each armed with two rapid-firing guns. At three suitable places there are armored points of observation, from two of which at night the electric light can be flashed to watch the operations of the enemy. Below this surface the earth is hollowed out in the form of a huge well with armored sides, which is divided up into sections, each part protected with heavy armor, one part for provisions and ammunition, another for machinery, which includes the dynamos and accumulators for the lighting of the whole fort, hydraulic machines for working the movable turrets and sending them ammunition, pumps for supplying these machines with water, and a series of ventilators to keep the air pure. Communication with the outer world is made by a subterranean gallery, the length of which varies according to surrounding circumstances. The ceiling of this gallery is from 8 to 10 m. below the surface. To gain access to the fort a hydraulic piston is worked, and this raises a ladder which runs along the whole length of the fort, and lowers the door of the outlet, which is protected by armor 20 c. cm. in thickness, and is under the fire of two of the movable forts. All movements, such as changes of guard, arrivals of supplies, &c., are reported by telephone or telegraph. The guard does not work the hydraulic piston, except at command, and when the sentries in one of the movable forts have reconnoitered the visitors. Finally, the gallery communicating with the outer world is strongly fortified by an armored door defended by two mitrailleuses. One of the greatest objections by generals to forts, that they absorb numbers of men who are wanted in the field, cannot be urged against these subterranean forts, for the garrison consists of 30 or 40 mechanics and specialists only, whose absence would not appreciably weaken the regiment from which they are drawn. The cost of one of these forts is only about \$500,000.

It is reported that the Pennsylvania Steel Company, at Steelton, has had a favorable experience with the Archer fuel gas. We understand that 1026 tons of steel were heated in one day with a consumption of only 3 gallons of oil per ton of steel.

The Briggs Iron and Tool Company, Findlay, Ohio, will erect a new forge building, 160x40, on their premises. The new building will contain a 20-bar guide mill. The building to be occupied and used in the manufacture of chain, is rapidly approaching completion, the forges, anvils and machinery being very nearly all arranged in their proper places. The tool department is in continuous and active operation.

The Nordenfeldt, submarine boat, has been purchased by the Russian Government, and is now in the Baltic on her way to Cronstadt.

THE METAL SCHEDULES.

A Comparison of Present and Proposed Duties.

ARTICLES.	PRESENT RATE.	MILLS BILL.	SENATE BILL.
Iron, in pigs, kentledge and scrap.....	\$6.72 per ton.....	\$6 per ton.....	\$6.72 per ton.
Bars or rails for railways—			
Other railway bars, weighing more than 25 lbs. to the yard—			
Iron, tons.....	\$15.68 per ton.....	\$11 per ton.....	\$15.68 per ton.
Steel, or in part of steel, tons.....	\$17 per ton.....	do.....	\$15.68 per ton.
Bar Iron—			
Bars, blooms, billets, or sizes or shapes of any kind, in the manufacture of which charcoal is used as fuel, tons.....	\$22 per ton.....	\$20 per ton.....	Not less than \$22 per ton.
Rolled or hammered, comprising—			
Flats not less than 1 inch wide nor less than $\frac{3}{8}$ of 1 inch thick, lbs.....	8-10 c. per lb.....	7-10 c. per lb.....	8-10 c. per lb.; $\frac{3}{4}$ rounds and squares, 9-10 c. per lb.; smaller to 7-16 1 c. per lb.; 35 per cent. ad val. minimum.
Flats less than 1 inch wide or less than $\frac{3}{8}$ of 1 inch thick; round iron less than $\frac{3}{4}$ of 1 inch and not less than 7-16 of 1 inch in diameter, and square iron less than $\frac{3}{4}$ of 1 inch square, lbs.....	1 1-10 c. per lb.....	1 c. per lb.....	
Bars or shapes of rolled iron, not specially enumerated or provided for, and round iron in coils or rods, less than 7-16 of 1 inch in diameter, lbs.....	1 2-10 c. per lb.....	1 c. per lb.....	1 1-10 c. per lb.
Bars or rails for railways—			
Flat rails, punched—			
Iron, tons.....	\$17.92 per ton.....	\$15 per ton.....	\$15.68 per ton.
Tee rails, weighing not over 25 lbs. to the yard—			
Steel, tons.....	\$20.16 per ton.....	\$14 per ton.....	\$15.68 per ton.
Iron or steel, flat, with rib, for fencing.....	6-10 c. per lb.....	4-10 c. per lb.....	3c. value or less, 6-10c.
Sheet iron, common or black—			
Thinner than 1 inch and not thinner than No. 20 wire gauge, lbs.....	1 1-10 c. per lb.....	1 c. per lb.....	1 1-10 c. per lb.
do No. 20 do No. 25 do No. 29 do do.....	1 2-10 c. per lb.....	1 1-10 c. per lb.....	1 2-10 c. per lb.
do No. 25 do No. 29 do do.....	1 4-10 c. per lb.....	1 $\frac{1}{2}$ c. per lb.....	1 4-10 c. per lb.
do No. 29.....			1 5-10 c. per lb.
Sheets and plates, pickled or cleaned by acid, or by any other material or process, and cold-rolled—			
Sheets—			
Thinner than 1 inch and not thinner than No. 20 wire gauge, lbs.....	1 35-100 c. per lb.....	1 35-100 c. per lb.....	Polished, planished or glanced, 25-10 c. per lb.; pickled, cleaned by acid or cold-rolled, $\frac{1}{2}$ c. addition to common black gauges.
do No. 20 do No. 25 do No. 29 do do.....	1 75-100 c. per lb.....	1 75-100 c. per lb.....	
do No. 25 do No. 29 do do.....	1 75-100 c. per lb.....	1 $\frac{1}{2}$ c. per lb.....	
Sheets or plates of iron or steel (except what are commercially known as tin plates,terne plates and taggers tin), galvanized or coated with zinc or spelter, or other metals, or any alloy of these metals—			
Thinner than 1 inch and not thinner than No. 20 wire gauge, lbs.....	1 85-100 c. per lb.....	1 $\frac{1}{2}$ c. per lb.....	$\frac{3}{4}$ c. per lb. in addition to sheet iron duties.
do No. 20 do No. 25 do No. 29 do do.....	1 85-100 c. per lb.....	1 60-100 c. per lb.....	
do No. 25 do No. 29 do do.....	2 25-100 c. per lb.....	2 15-100 c. per lb.....	
Tin plates,terne plates and taggers tin.....	1 c. per lb.....	Free.....	1 c. per lb.
Hoop, band, scroll or other iron, 8 inches or less in width.....	1 c. per lb.....	1 c. per lb.....	
Thinner than No. 10 and not thinner than No. 20 wire gauge, lbs.....	1 2-10 c. per lb.....	1 2-10 c. per lb.....	1 1-10 c. per lb.
do No. 20 wire gauge, lbs.....	1 4-10 c. per lb.....	1 3-10 c. per lb.....	1 3-10 c. per lb.
Cotton ties.....	35 per cent.....	free.....	2-10 c. per lb. in addition to duty on hoops from which made, 9-10 c. per lb.
Cast iron pipe of every description, lbs.....	1 c. per lb.....	6-10 c. per lb.....	
Nails, spikes, tacks, brads or sprigs—			
Cut nails and spikes of iron or steel, lbs.....	1 $\frac{1}{2}$ c. per lb.....	1 cent per lb.....	1 c. per lb.
Cut tacks, brads or sprigs—			
Not exceeding 16 ounces to the thousand, M.....	2 $\frac{1}{2}$ c. per M.....	35 per cent.....	2 $\frac{1}{2}$ c. per M.
Exceeding 16 ounces to the thousand, lbs.....	3 c. per lb.....	do.....	2 $\frac{1}{2}$ c. per M.
Railway fish-plates or splice-bars of iron or steel, lbs.....	1 $\frac{1}{2}$ c. per lb.....	8-10 c. per lb.....	1 c. per lb.
Nuts and washers of wrought iron or steel, lbs.....	2 c. per lb.....	1 $\frac{1}{2}$ c. per lb.....	1 8-10 c. per lb.
Horse, mule or ox shoes, lbs.....	do.....	do.....	do
Spikes of wrought-iron or steel, lbs.....	do.....	do.....	do
Anvils.....	do.....	do.....	2 c. per lb.
Anchor and parts thereof, &c.....	do.....	do.....	1 8-10 c per lb.
Rivets, bolts with or without threads or nuts or bolt-blanks, and finished hinges or hinge-blanks of iron or steel, lbs.....	2 $\frac{1}{2}$ c. per lb.....	1 $\frac{1}{2}$ c. per lb.....	2 $\frac{1}{2}$ c. per lb.
Blacksmiths' hammers, sledges, &c., lbs.....	do.....	do.....	2 $\frac{1}{2}$ c. per lb.
Axles, parts thereof, axle-bars, axle-blanks or forgings for axles without reference to the stage or state of manufacture, of iron or steel.....	do.....	do.....	2 c. per lb.
Forgings of iron and steel, or forged iron of whatever shape or in what stage of manufacture, not specially enumerated or provided for, lbs.....	do.....	do.....	2 3-10 c. per lb., 45 per cent. adval. minim.
Horseshoe nails, hob nails, wire nails, &c., lbs.....	4 c. per lb.....	2 $\frac{1}{2}$ c. per lb.....	4 c. per lb.
Wire nails—			
Two inch and longer, not lighter than No. 12 W. G.....	4 c. per lb.....	2 $\frac{1}{2}$ c. per lb.....	2 c. per lb.
1 to 2 inches long, lighter than No. 12, and not lighter than No. 16 W. G.....	4 c. per lb.....	2 $\frac{1}{2}$ c. per lb.....	2 $\frac{1}{2}$ c. per lb.
Shorter than 1 inch and lighter than No. 16 W. G.....	4 c. per lb.....	2 $\frac{1}{2}$ c. per lb.....	4 c. per lb.
Tubes or flues or stays, of wrought iron or steel—			
Boiler-tubes or flues or stays, lbs.....	3 c. per lb.....	1 $\frac{1}{2}$ c. per lb.....	2 $\frac{1}{2}$ c. per lb.
Other tubes, lbs.....	2 $\frac{1}{2}$ c. per lb.....	do.....	do
Chain or chains of all kinds, made of iron or steel—			
Not less than $\frac{3}{4}$ of 1 inch in diameter, lbs.....	1 $\frac{1}{2}$ c. per lb.....	1 $\frac{1}{2}$ c. per lb.....	1 6-10 c. per lb.
Less than $\frac{3}{4}$ of 1 inch and not less than $\frac{3}{8}$ of 1 inch in diameter, lbs.....	2 c. per lb.....	1 $\frac{1}{2}$ c. per lb.....	1 8-10 c. per lb.
Less than $\frac{3}{8}$ of 1 inch in diameter, lbs.....	2 $\frac{1}{2}$ c. per lb.....	2 c. per lb.....	3 cents per lb.

NOTE.—For changes in iron castings, malleable-iron castings, boiler plate, steel ingots, blooms and billets, iron and steel of irregular section, cutlery, screws, &c., see article published elsewhere.

Andrew Carnegie on Trusts.

Mr. Andrew Carnegie returned from Europe this week, in company with Henry Phipps and W. R. Jones, and was promptly interviewed, the principal part of his talk being confined to discussing trusts. He is reported as having said:

The truest words that can be said about trusts are that no one has much cause to fear trusts except he who goes into them. There is no possibility of maintaining a trust. It is bound to go to pieces sooner or later, and generally to involve in ruin those foolish enough to embark in it. If successful for a time and undue profits accrue, competition is created which must be bought out, and this leads to fresh competition, and so on until the bubble bursts.

Then the article which it was proposed to enhance in price is made for years without profit, and the consumer has his ample revenge. When you find me trying to organize any steel rail trust, set it down that softening of the brain has surely begun. There should be displayed in the office of any trust an illuminated text:

“If I was so soon to be done for, I wonder what I was begun for.”

It has been vigorously maintained by free traders and others that the protective system produces trusts.

It has no more to do with trusts than with the tides. The chief trusts are in Europe. The copper syndicate is a French trust; the salt trust is English, and the greatest trust I have ever known was the steel rail trust in England, which embraced the Continental works as well. Of course it went to pieces, as is the nature of trusts, and as a consequence the foolish combiners have ever since been bestowing steel rails upon an ungrateful world for less than cost.

The public may regard trusts or combinations with serene confidence, for the great law cannot be broken—namely, that where there is no monopoly, but every one is free to embark in the business, it is impossible for any body of men to exact from this people for any length of time more than the average return for capital and labor. Whenever undue profits are made, competition soon steps in.

It is the same with railroads. New York Central has its West Shore and the Milwaukee St. Paul as its rival. Notwithstanding all we hear of railroad pools, the result is that America enjoys the cheapest and best railroad transportation in the world, just because there is no monopoly. People can build other railroads, and build them they will, whenever any one line is seen to reap dividends beyond the average. Just so with trusts. Watch the end of

the copper or coffee or sugar trusts, or salt, or European steel rail trust, and you will see that this great law will be obeyed.

It is natural that manufacturers should meet and resolve and re-resolve in a period of depression that they will stop bleeding each other to death; but I have never known an attempt to defeat the law to be permanently successful. When I was very young in business and not very strong financially, I used to hope that something could be done in the way of combination with others to prevent impending ruin. But the result was always a failure, and often personal bitterness between men who had before been on good terms with each other, and then a renewal of the fierce struggle with increased energy.

The fatal weakness of all trusts is that if successful temporarily they cause permanent injury, for under higher prices other concerns grow strong. They may have a million of dollars to lose, rather than risk the cost, disorganization and danger of a stoppage of the works. This is the case in England to-day. Since the trust broke in steel rails there has been a struggle as to which should crowd out the others, and for several years this has been carried on. To be permanently successful the manufacturer must make up his mind that the day of exorbitant profits is at an end and take a small profit per ton or per

yard, and make great quantities and let the consumer have everything cheap.

Then you mean to say that there is no trust in steel rails?"

Not any more than there is among the morning newspapers of New York. We can no more combine than the newspapers. There are 14 steel rail mills in the country and a new competitor just about ready to start. Every mill manages its own business and fixes its own prices. Just look at the situation. Rails sold for \$40 per ton this time last year because all the mills, running night and day, could not supply the demand. There was no artificial raising of prices. To-day they have fallen to \$28 per ton because there is not demand for all the mills can make. Not much of a trust here, is there?

No trade in this country is more disastrously competed for than that of steel rails, and there never was and never could be a trust created that would last through a period of depression. Any railroad company can to-day exchange a ton of its old, worn-out rails and get a ton of new steel rails by paying \$5 difference. This is what a protective duty has done in a few years. It has tempted so much capital into the manufacture of steel rails that no manufacturer can hope to get a fair dividend upon the capital except through works of recent construction, favorably located, and the closest and most skillful management.

The consumer gets steel rails for \$28 per ton, and has not paid more than \$40 per ton for years even when a great boom was on and every one wanted rails in a hurry. Yet you will find now and then some professor writing in his closet who knows nothing but what he reads in old English text-books that the duty is added to the cost and paid by the consumer. The total cost of rails to-day is only the amount of the original duty imposed—viz., \$28 per ton. If these doctrinaires are right that the consumer pays the amount of the duty, then, deducting the \$28 duty, there would not be a cent left for the rails. It's the fashion just now to assert that manufacturers of steel rails in this country have made unusual profits. Nothing could be more groundless. The capital invested in the Bessemer steel rail manufacture, taken as a whole, has not paid interest. If the business is so profitable why don't those who think so invest in it? They need not build new works. The shares of many of the existing works can be bought any day through brokers for less than the capital invested, as shown by the books of the concerns. We make much more iron and steel in various shapes than we do rails, for rails have not paid us as much per ton as other forms. The rail business is good about one year in four, and then for four years manufacturers are fortunate who pay their interest account, competition is so terribly severe.

An Electric Crane.—At the recent meeting of the British Association for the Advancement of Science Mr. W. Anderson read a paper on "The Application of Electricity to the Working of a 20-ton Traveling Crane." He explained that one of the traveling cranes at Erith Iron Works, England, was originally constructed to be worked by hand, but preparation had been made to apply wire rope driving. The inconveniences of this plan were considerable, and electricity was introduced as a motive power, a dynamo being fixed in the boiler-house for this purpose. The motor was shunt-wound, and provision was made for varying the power and speed to suit the requirements of the foundry. A single attendant could work the machine, which had worked satisfactorily since June last. About 65 per cent. of the power developed

in driving the steam-engine was utilized. One or two more electric cranes were at work in other factories.

CORRESPONDENCE.

The Babcock & Wilcox Company.

To the Editor: You have done me the honor to copy a letter which I wrote to the New York Times from Holland in regard to the shipment by the Babcock & Wilcox Company of boiler tubes from this country to Glasgow. I notice that through an error of the types either in the office of the New York Times or in yours I am made to say that the sales of our company for the month of June required 1,000,000 feet of 4-inch tubes, whereas I wrote 100,000. The error is merely one cipher, but it is worth correcting, as I would not have any one suppose that I would deliberately make so wild a mis-statement. I thought that 100,000 feet of tubes in a month was a sufficient quantity to make a note of. Though the sales for the month of September are nearly twice as great as those for June, we do not hope to get up to the 1,000,000 feet per month—at least for some time to come. Very truly yours,

GEO. H. BABCOCK.

Engines of the Steamer Connecticut.

The steamer Connecticut, built for the Providence and Stonington Steamship Company, is provided with an engine of a type not unusual abroad but almost new here, and differing widely from the beam engine which has been almost universally employed in our Eastern waters. This engine was, like the boat itself, designed by Mr. George B. Mallory, and has been built under his supervision by the William Cramp & Sons Ship and Engine Building Company, of Philadelphia. It is a compound oscillating engine—the largest of the kind ever built in this country—having a high-pressure cylinder 56½ inches diameter and a low-pressure cylinder 104 inches diameter, both having 11-foot stroke.

The steam-port nozzles for the high-pressure cylinder are 6 x 41 inches inside, and those for the low-pressure cylinder 8½ x 100 inches inside. The steam passes through the high-pressure trunnion through a composition stuffing-box sleeve 24 inches inside diameter, surrounded by stuffing-boxes and double air spaces. From the trunnion it passes through a side pipe 18 inches inside diameter to the valve-chest. From the exhaust chests the steam passes to the exhaust trunnion through a 22-inch side pipe. The high-pressure exhaust trunnion is connected with the low-pressure trunnion by a receiver pipe 26 inches inside diameter, having an easy bend and surrounded by a steam-jacket with 2-inch spaces. The exhaust side pipe on the low-pressure cylinder is 33 inches diameter; from the exhaust trunnion the steam passes through a grease extractor, and thence to the steam space in the surface condenser through a copper pipe 33 inches diameter.

The cylinders are cast without heads, the heads and steam-chests being bolted on; the upper head of each cylinder is fitted with heavy double brackets for guides for each piston-rod, those for the small cylinder being 15 inches, and those for the large cylinder 21 inches long. The pistons have cast-iron rings, and steel springs are provided for setting out these rings. The piston-rods for the high-pressure cylinder are 9 inches, and those for the low-pressure cylinder 10 inches diameter. The valve-gear is Wheelock's improved gridiron, with automatic trip cut-off. The steam opening on the high-pressure cylinder is 6½ x 52 inches, and the exhaust opening 11½ x 52 inches, while on the low-pressure cylinder the openings are 9½ x

102 inches and 19½ x 102 inches, respectively. The valve motion is of the link type, and there are three eccentrics, two for the link and one for the cut-off. A small steam engine is provided for working the reverse-lever and adjusting the valve-gear. The surface-condenser is of cast iron, box form, containing 3916 brass tubes ¾ inch outside diameter, the distance between the tube-sheets being 16 feet. The exposed surface is about 12,150 square feet. An auxiliary condenser is also provided, having about 750 square feet of exposed tube surface.

There are two single-acting air pumps 35 inches diameter and 17-inch stroke; four feed pumps 5 inches diameter and 17-inch stroke, and two bilge pumps of the same size. These eight pumps are arranged in two sets of four each, worked from a horizontal crankshaft, and between the two sets is placed the engine which works them, a compound engine with high-pressure cylinder 14 inches, low-pressure 24 inches diameter, both 17-inch stroke. There is also an auxiliary air and circulating pump. The main circulating pump is a centrifugal pump with suction and delivery pipe each 16 inches in diameter. The engine is carried by two heavy keelsons of steel plates and angle irons, upon which are the A-shaped galleys frames of box girders built up of wrought-iron plates and angles. These frames are connected by sway braces, and carry on top the pillow blocks for the main shaft. The keelsons rest on yellow pine keelsons on top of the cross floors, and are securely bolted to and through the hull timbers. The condenser is carried on the after end of the steel keelsons. The crank is of the built-up form, the crank pin having a bearing 18 inches diameter and 49 inches long. It is shrunk into one crank arm, and secured by a nut at one end and gibs at the other. The crank arms are also shrunk on and keyed to the ends of the two shafts, each of which is 33 feet 6 inches long, and has journals 23 and 25 inches diameter.

The boat has feathering paddle-wheels 28 feet diameter between centers of the bucket trunnions. There are 12 buckets, each 14 feet face and 4 feet 6 inches wide. The buckets are of oak 4½ inches thick. The wheel-frame carries bearings for the bucket trunnions, and the feathering motion is given by eccentrics keyed on the main shaft. Steam is furnished by six boilers of the "gunboat" type, each 12 feet 6 inches diameter and 20 feet 1½ inches extreme length. These boilers carry 120 pounds working pressure, and are of steel, all rivet holes drilled, the outside shell ¼ inch thick. In each boiler there are three corrugated furnaces 48 inches inside diameter and 7 feet 6 inches long; back of the furnaces is a deep combustion-chamber from which run 424 tubes 3¼ inch diameter and 8 feet long. The boilers are arranged in two sets of three each, and over each set is a superheater 11 feet diameter and 12 feet extreme height, having a single flue 7 feet 6 inches diameter. The smokestacks stand directly on the superheaters. There is also a donkey-boiler of the locomotive type 7 feet diameter of barrel and 12 feet long over all, made of steel. It has 156 tubes 3 inches diameter. Six independent steam pumps are provided for feed and other purposes. The engine is expected to develop about 4500 indicated horse-power at 25 revolutions per minute with a full load—about 500 tons—on board. When driven at full power, 5500 horse-power will be developed, and a speed of 19½ miles per hour obtained for the vessel.

The Jarecki Mfg. Company, Limited, of Erie, Pa., are building a small addition to their works to meet the demands of increasing business.

TRADE REPORT.

Chicago.

Office of The Iron Age, 96 and 97 Washington St.,
CHICAGO, October 8, 1888.

Pig Iron.—Some improvement is to be noted in the demand, and prices show a renewed upward tendency. The advance now in progress is mainly confined to the brands which have been selling at the lowest figures, makers finding that the market is in condition to sustain an additional 50¢ to \$1 per ton. The change in quotations is, consequently, a revision of inside figures. There is also such a demand for high numbers of Lake Superior Charcoal, due to the scarcity of Old Car-Wheels, that some furnace companies have advanced their price of Nos. 4 to 6 from 50¢ to \$1 above the lower numbers. The scarcity of Pig Iron for immediate shipment has been pretty thoroughly demonstrated by the experience of some of the dealers during the past week. Desiring to accommodate some of their customers, and their own furnaces being sold up, they have applied to a considerable number of other furnaces without being able to secure any quantity. The immediate demand being for small lots, consumers are supplied by this scouring of the sources of production, but if larger quantities should be called for there would certainly be a deficiency in the supply, causing either a sharp advance in price or the starting up of additional furnaces now standing idle. Some indications of such a demand are now visible, inquiries being received for round lots from heavy consumers who have evidently not fully covered their requirements. The architectural foundries are very quiet, but other foundries are quite busy. The advance in freight rates mentioned in last week's report was not on Pig Iron from the Mahoning and Shenango valleys, but on Southern Pig Iron. The rate from Birmingham to Chicago is now \$4.15. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$20 @ \$21; Alabama Car-Wheel, \$26.25; Jackson County Softeners, No. 1, \$17.50 @ \$18.50; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband) No. 1, \$19.75 @ \$20; other Ohio Scotch Irons, No. 1, \$18 @ \$19; Lake Superior Coke, No. 1, \$18.50 @ \$19; No. 2, \$17.50; No. 3, \$16.50; Southern Coke, No. 1 Foundry, \$18 @ \$18.50; No. 2 Foundry and No. 1 Soft, \$17.50; No. 3 Foundry and No. 2 Soft, \$16.75 @ \$17; Gray Forge, \$16.25 @ \$16.50.

Bar Iron.—Business shows a little improvement, though the demand is by no means general. The mills are so well supplied with work, however, that dullness could probably continue for some weeks yet without affecting prices very much. Buyers are endeavoring to secure better terms by various ingenious devices, but they have little prospects of success so long as manufacturers have plenty of orders on their books and at the same time find raw material as dear as it now is. Car orders are being talked about, but most railroad companies are still too poor to purchase the rolling stock which they so badly need. Quotations are unchanged, at 1.75¢ @ 1.80¢, half-extras, f.o.b. Chicago, for mill lots of Common Iron, but the Ohio and Pittsburgh manufacturers are now endeavoring to establish a rate f.o.b. mill, as they are apprehensive of an advance in railroad freights. Small lots of Common Iron are quoted at 2¢ from store, with 1.90¢ @ 1.95¢, asked, for carloads.

Structural Iron.—Very little new business is reported. Mill lots of Angles are

quoted at 2.20¢ @ 2.25¢, f.o.b. Chicago; Universal Plates, 2.25¢; Tees, 2.55¢ @ \$2.65; Beams and Channels, 3.40¢. From store, Angles are quoted at 2.35¢ @ 2.50¢; Tees, 2.60¢ @ 2.75¢; Beams, 3.80¢.

Plates, Tubes, &c.—While a very fair volume of business is in progress, trade is somewhat disappointing, as it had been supposed that the excellent demand of August and September would develop this month into decided briskness. No change in store prices has been made that would affect quotations, but an upward tendency is indicated by the higher rates now being asked on large lots. Tubes are firmer, although some manufacturers have not advanced their discount to the rate named by the majority. Quotations from store are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢ @ 2.70¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 62½ % off.

Sheet Iron.—The scarcity is as marked as ever, buyers finding great difficulty in picking up even a single bundle from the jobbing houses. Jobbers need all they are now receiving from the mills to fill orders taken some time since. The manufacturers are harassed as they have seldom been by urgent appeals to make more prompt deliveries. Few of them are now making quotations, their full capacity being engaged to the end of the year. Jobbers' quotations from store are still 3.20¢ for No. 24, 3.30¢ for Nos. 25 and 26, and 3.40¢ for No. 27.

Galvanized Iron.—Large as the demand was last year at this time, it is greatly exceeded by the activity now prevailing. No one cause seems to be responsible for the improved condition of trade, but all classes of consumers except the cornicemen have increased their purchases. The dealers have had much difficulty recently in supplying orders from stock, often being unable to furnish the particular gauge desired. Prices are firmly maintained, small lots being quoted at 60 % off for Juniata, and 60 % and 5 % off for Charcoal.

Merchant Steel.—Business continues quiet, the few large consumers who have not yet placed their season contracts being evidently inclined to wait either until after the election or toward the close of the year. Combination prices are unchanged, as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Actual business still appears to be confined to small lots, but enough inquiries for large quantities are in the market to make manufacturers feel hopeful of a much better condition of trade shortly. Some of the leading railroad companies of the Northwest are asking for quotations for next year's delivery, and it is altogether probable that they will have numerous followers as soon as it is known that they have positively closed such contracts. An incentive to such action is the knowledge that manufacturers look forward to higher prices in 1889, although they frankly concede that at present the indications are not in favor of greatly increased business. For fall delivery nominal quotations are \$30 @ \$31.

Old Rails and Wheels.—Such transactions in Old Iron Rails as have come to light in the past week seem to indicate a return to lower prices. A lot of 800 to 1000 tons was sold by a railroad company in Central Illinois at \$24 delivered in the Mahoning Valley, or equivalent to \$23 at Chicago, allowing for difference in freight rates. Chicago holders ask \$24 @ \$24.50

for such lots as they control, and claim that they will not take lower prices, as the supply available at present is very limited. Old Steel Rails are in moderate demand at \$19 @ \$20 for straight pieces over 3 feet in length and free from Frogs, &c. Old Car Wheels are very quiet, owing to scarcity, a nominal quotation being \$20, but it is hardly likely that consumers would pay so much.

Scrap Iron.—But little movement is reported, although inquiries for Wrought are becoming more numerous, and a few sales of Mill and Cast have been made. Stocks are not large in dealers' hands, and they are inclined to ask higher prices, naming the following rates for carefully selected Scrap @ ton of 2000 lb: No. 1 Forge or Railroad Shop, \$20.50 @ \$21; Track, \$19.50 @ \$20; No. 1 Mill, \$16; Pipes and Tank, \$13; Light Wrought, \$10; Horseshoes, \$19.50; Axles, \$26; Cast Machinery, \$14.50 @ \$15; Stove Plate, \$11; Cast Borings, \$9; Wrought Turnings, \$12; Axle Turnings, \$14; Coil Steel, \$15; Leaf Steel, \$16 @ \$17; Locomotive Tires, \$16 @ \$16.50; for Mixed Country Scrap dealers offer \$13.50 @ \$14.

Hardware.—Jobbers of Heavy Hardware report business in a very satisfactory condition, prices being pretty well sustained, the demand large and constantly growing for Iron, Steel, Carriage and Wagon stock, Farriers' Supplies, &c., and collections good. In Shelf Hardware a decided improvement is noted over the previous week, all classes of building materials being in active demand, as well as House-Furnishing Goods and small wares generally. In Stamped Tinware prices have been advanced to 70 % and 70 % and 10 % off. Screws are also manifesting a decided upward tendency. No special changes worthy of note have occurred in other lines.

Nails.—Few sales of large lots are reported either of Cut or Wire Nails. The heavy stocks laid in by Missouri River jobbers during the railroad war last spring are not yet entirely exhausted, and in this immediate vicinity the consumptive demand has not for some time been sufficiently strong to require continued renewal of stocks by jobbers. The demand is so slow, in fact, that specifications are being withheld by parties who had more contracts when Steel Nails were selling at \$1.75 at factory. Another advance in Wire Nails is expected soon, but in Cut Nails everything waits on the result of the attempt to form a combination of the manufacturers. Steel Cut Nails are still quoted at \$2.05 @ \$2.10 for carloads, and \$2.15 for small lots, but manufacturers' prices are being cut to some extent, so that the market cannot be called firm. Wire Nails continue firm at \$2.60 for small lots.

Barb Wire.—Business is distressingly dull, and the condition of trade is not made any better by offers of Barb Wire at prices evidently dictated by financial necessity. Manufacturers and jobbers are endeavoring to get 2.90¢ for Painted and 3.65¢ for Galvanized in a regular way. The abandonment of the latest effort to harmonize the views of manufacturers precipitates a struggle for existence which must soon thin their numbers considerably, if trade does not improve sufficiently to sustain an advance.

Pig Lead.—Small quantities have been sold at 5¢ @ 5.05¢, but consumers have secured considerable stock at slightly lower prices and now claim to be well supplied for the future.

Charles Himrod & Co., 115 Dearborn street, have been appointed sales agents for the Jackson Iron Company, who have started up the Huron Furnace, at Jackson, Ohio, and will turn out a superior grade of Soft Pig Irons.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., October 9, 1888.

Pig Iron.—There is no perceptible change since last week, the tone of the market being steady and firm. It seems unnecessary to go over the ground again, as the conditions are precisely the same as last week. There is no scarcity of business at the inside figure, and no scarcity of Iron at the outside rates. Furnaces are well supplied with orders, and consumers have covered their anticipated requirements well on to the close of the year, so that for the present there is no urgent necessity either to buy or sell. The probabilities are, that there will be a "stand-off" until after the election, and then it is expected that the movement will be a lively one in case the Republican party wins. In the other event, business may possibly fall into a rut similar to that experienced during the first seven or eight months of the year, although there is a great deal of work which cannot well be postponed, no matter who is elected. Cars, for instance, are badly wanted by many roads, and it is thought that ship-building will be actively prosecuted during the next 12 months; and, besides that, the country is making progress in every direction, so that the increase of population and the increase in wealth must necessarily create a demand for manufactures of all kinds. As regards Pig Iron, an additional reason for its firmness is said to be the scarcity of good Ores, and the tendency of all materials to a higher range of cost. Of course it is impossible to make predictions with much confidence until after the elections, but there is an undertone of strength and expectancy, which under favorable conditions might start things on a run, but in the meantime there is a disposition to wait developments, feeling that under any circumstances prices are by no means high, and not likely to hurt legitimate dealers who confine their operations within their usual time limits. Sales during the week have been on the basis of \$16 @ \$16.50 at tide for standard brands of Gray Forge, \$17.50 @ \$18 for No. 2 Foundry and \$18.50 @ \$19 for No. 1, with the usual premium on strictly choice and favorite brands. We note a sale of 2000 tons of Pulaski Gray Forge at a sum equal to \$16.50, Philadelphia.

Blooms.—There is a good deal of inquiry, but buyers have not responded to the demand for higher prices, as might have been expected. Sales within limits as follows: Nail Slabs, \$29 @ \$29.50, at mill; Billets from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 per "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$29.50 @ \$30.50 for Nail Slabs; \$34 @ \$36 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martina, price according to analysis, &c.

Muck Bars.—The scarcity continues, and prices again show a slight advance on last week's quotations. Asking rates are \$29.50 @ \$30, delivered, with sales reported at the first-named figure, and also at \$29 at mill.

Bar Iron.—No great amount of business has been placed during the past week, but mills have so much work on their books that they are not in a position to take much more for early delivery. There is a good deal of inquiry, however, and it seems more than likely that when the present orders are worked off there will be plenty more to replace them. The advance noted last week has been fully maintained, and the feeling is one of great firmness all the way through the list. Skelp Iron is still wanted in large lots and several lots have been taken at 1.95¢,

although 2¢ is now the general asking price, which would probably be paid for prompt deliveries. Bars range from 1.85¢ to 2¢, according to delivery, quantity and requirements as to quality, the entire market having a steady and firm appearance.

Plate and Tank Iron.—There is a fair demand for Plates of every description, but there is no unusual pressure, although mills are running full on orders for early delivery. There is work in prospect which may bring in large orders in course of a few weeks, but in the meantime mills have plenty to go on with and are likely to be in good shape during the balance of the year. Prices about as quoted last week: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—There is a good deal of inquiry for bridge material, and although there is no special urgency in the demand, the outlook is thought to be very encouraging. The mills are somewhat pressed for early deliveries, and specifications on old contracts are being hurried forward. Prices same as last week, viz.: 2.10¢ @ 2.15¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The demand is well maintained, but prices have not responded to the increased activity. Small lots command the following prices for the best makes:

Best Refined, Nos. 26, 27 and 28.... 3¼ @ 3½¢
Best Refined, Nos. 18 to 25.... 3 @ 3½¢
Common, ¼¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28.... 4¼ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25.... 4 @ 4½¢
Best Bloom Sheets, Nos. 16 to 21.... 3¾ @ 3½¢
Blue Annealed..... 2.8 @ 3 ¢
Best Bloom, Galvanized, discount..... 62½¢
Common, discount..... 67½¢

Merchant Steel.—There is a fair demand at prices quoted herewith—viz.: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Open-Hearth Ordinary Spring, 2.7¢ @ 2.9¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—The demand is not important, and orders for this year's delivery are readily placed at \$29 @ \$29.50, according to quantity, &c. There is some inquiry for spring delivery, but sellers are a little undecided in regard to quotations, although \$30 would probably be shaded on a desirable class of business.

Old Rails.—There is nothing doing in this market, although there are buyers at \$23 and sellers at \$24 for foreign shipments. No sales of spot lots, but \$25 has been paid for deliveries at mills in the interior.

Scrap Iron.—There is a fair movement, and sales are readily made at about the following quotations: \$21 @ \$21.50 for cargo lots; \$21.50 @ \$22.50 for carload lots, delivered, or for choice \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—Mills are filled with orders well up to the end of the year. Prices are firm, and Pipe is very scarce. Discounts are quoted as follows: Black Butt Welded, 52½¢; Galvanized do., 42½¢; Black Lap Welded, 62½¢; Galvanized do., 52½¢; Boiler tubes 60¢.

Nails.—The demand is very disappointing, and the feeling in the trade is one of great depression. Prices are nominally from \$1.95 to \$2 from store, but quota-

tions are very irregular, and depend very much upon circumstances in each individual case.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, October 8, 1888.

The general Iron situation continues in a fairly satisfactory condition. There is no falling off in the volume of business notwithstanding the near approach of the Presidential election, but there is continued complaint in regard to prices. There is a very large volume of business in the aggregate. This is evident from the fact that nearly all the mills and furnaces are in operation, and some of the former are being worked up to their full capacity. Never before, possibly, was there a larger output of Iron and Steel in this district than at present, and but for the closeness in prices there would be no room for complaint. River navigation has again been resumed, an important matter for our manufacturers, who are very much interested in cheap transportation. The placing of an order here or elsewhere often hinges upon transportation, and rates by river are always less than by rail. Finished Iron is often shipped from Pittsburgh to St. Louis, a distance of about 1200 miles, for 10¢ @ 12½¢ per 100 lbs., whereas the rate by rail is nearly double. The Fifth Avenue Cable Road will be opened up for business this week, and the Penn Avenue Cable Road will, it is expected, be ready for business about the 1st of December. Pittsburgh can also boast of two electric street railroads, one of which is said to be the best built and equipped road of the kind in the country.

Pig Iron.—There has been an increased volume of business during the past week, and while there has been no advance in price, the market is firmer. Consumers generally appear to have arrived at the conclusion that there is not much risk in buying at present prices, and that some of them are apprehensive of an advance is evident from the fact that they are anticipating future wants. Included in the sales reported was one of 4000 tons for future delivery. The market is firmer than it was a couple of weeks ago, and furnacemen who were then disposed to make additional contracts are now indifferent. Consumers, now that they can see no prospect of any immediate reaction, are inclined to keep up their stocks of the raw article, while furnacemen, with very few exceptions, are pretty well sold up. Some of them have contracts enough booked to keep them busy for several months to come. However, while the market has steadied up there is no indication of any immediate advance; in a word, the feeling generally obtains that the market will continue to rule fairly active and steady at about present prices. We quote as follows:

Neutral Gray Forge.....	\$15.75 @ \$16.50.	cash.
All Ore Mill.....	17.00 @ 17.50.	"
White and Mottled.....	15.00 @ 15.50.	"
No. 1 Foundry.....	18.00 @ 18.50.	"
No. 2 Foundry.....	17.00 @ 17.50.	"
No. 3 Foundry.....	16.00 @ 16.50.	"
No. 1 Charcoal Foundry.....	23.50 @ 24.00.	"
Cold Blast Charcoal.....	25.00 @ 26.00.	"
Bessemer Iron.....	18.00 @	"

Included in the sale reported was 1500 tons Gray Forge at \$16.50, cash, and 4000 tons Bessemer at \$18, cash.

Muck Bar.—There is more doing, but no change in prices; sales 1500 tons at \$29, cash. A novel transaction was reported which hinges upon the result of the Presidential election: 1000 tons for November delivery, the price for which is to be \$31.50, cash, if the Republicans are successful, whereas, if Cleveland is re-elected, it is to be \$29.50, cash.

Ferromanganese and Spiegel.—Sales of 80 ¢ Ferromanganese at \$56 @ \$56.50, cash, and Spiegel at \$28 @ \$28.50, cash.

Manufactured Iron.—There is a continued steady demand for all kinds of Merchant Iron, Sheet in particular, which is always active at this season of the year, when it is wanted for Stove Pipes, and prices are a shade higher. We continue to quote Bars at 1.80¢ @ 1.85¢; Plate, 2.20 @ 2.25¢; No. 24 Sheet, 2.85¢ @ 2.95¢; Skelp Iron, 1.85¢ @ 1.90¢ for Grooved, and 2.10¢ @ 2.12¢ for Sheared. The mills making a specialty of Pipe are reported quite busy—as having all they can do.

Nails.—There is no improvement in the demand for Nails, nor can it be expected at this season of the year. So far as Pittsburgh is concerned this has been a very poor year. In addition to a very light demand, prices have been unsatisfactory; while it is true that full card rates are being realized, it is also true that they afford little or no margin for profit. Pittsburgh manufacturers are stiff at full card rates and indifferent then, claiming that full card rates afford little or no margin for profit. We continue to quote at \$1.90, 60 days, 2 % off for cash.

Wrought-Iron Pipe.—There is a continued good demand, especially for small sizes. Mills are all busy and prices firm but unchanged. Discounts on Black Butt-Welded, 55 %; on Galvanized do., 50 %; on Black Lap-Welded, 65 %; on Galvanized do., 55 %; Boiler Tubes, 62½ % off; 2-inch Tubing, 13¢ per foot net; 5½-inch Casing, 40¢ per foot.

Old Rails.—There is more inquiry, and while the market is firmer prices remain unchanged. We can report a sale of 3000 tons American Tees at \$25.25, and 1000 tons Foreign Double-Heads at \$26, cash. As some buyers are buying for future requirements it is evident that they do not anticipate lower prices.

Billets, &c.—We can report sales of Bessemer Steel Billets at \$29, cash, delivered on cars at makers' works, and Nail Slabs at same price. Sales of Crop and Bloom Ends at \$18.50 @ \$19, cash.

Steel Rails.—Heavy sections are quoted at \$29.50 @ \$30, cash, on cars at mill here.

Merchant Steel.—There is a fair business; no change in prices, Best Brands Tool Steel, 84¢; Crucible Spring, 44¢; Crucible Machinery, 5¢; Open Hearth ditto, 24¢.

Old Material.—There is a fair demand, but no change in prices. No. 1 Wrought Scrap, \$21, net ton; Car Axles, \$26 @ \$27; Wrought Turnings, \$14.50 @ \$15; Cast Scrap, \$16, gross; Cast Borings, \$12.50 @ \$13, gross; Car Wheels, \$20, gross.

Cleveland.

CLEVELAND, October 8, 1888.

Iron Ore.—Very much to the surprise of the purchasers of Ore, transportation rates have declined several points during the past week. The partial failure of crops in the Northwest is responsible for this hitherto unknown occurrence. Vessel rates had been steadily climbing upward for the past month, and the Ashland and Two Harbors rate seemed likely to reach \$2.25 per ton. Owing, however, to the limited amount of grain offered for shipment at Duluth, many new vessels have asked for business at Ashland, Marquette and Escanaba. As a result charters are reported to-day at \$1.30 from Escanaba to lower lake ports, \$1.50 from Marquette and \$1.65 from Ashland and Two Harbors. This reduction in the cost of bringing Ore to the furnaces finds expression in a slightly easier feeling as to prices. While the general range of quotations cannot be changed, it is known that the

inside figures given in the list below very closely represent the prices at which Ores have been sold during the past week. The amount of business done has not been large owing to the fact that the best Bessemer are very closely sold up. The season's shipments are close up to 3,400,000 tons, and seem likely to slightly exceed 3,750,000 tons. This, however, does not fairly represent the business for the year, which opened with 700,000 tons of Ore on the docks at lower lake ports. This has gone into consumption, and there is little likelihood of the season's closing with any substantial quantities of unsold Ore on dock. Quotations, f.o.b. cars lower lake ports, are as follows:

No. 1 Specular and Magnetic Bessemer Ore.....	\$6.00 @ \$6.15
No. 1 Specular and Magnetic Non-Bessemer Ore.....	5.25 @ 5.50
Red Hematite Bessemer Ore.....	5.00 @ 5.25
Red Hematite Non-Bessemer Ore.....	4.10 @ 4.40
Menominee Range Bessemer Ore.....	5.15 @ 5.50
Menominee Range Non-Bessemer Ore.....	4.00 @ 4.25
Gogebic Range Bessemer Ore.....	5.25 @ 5.50

Pig Iron.—The market retains all its healthy conditions. A large amount of Iron is being sold at very firm prices, the tendency being toward advances all around. Sellers are, quite sensibly, not attempting to force prices, preferring instead a steady market at quotations admitted to be fair to all concerned. Buyers seem to be anticipating an advance, for many purchases largely in excess of immediate wants are reported. Mill and Foundry Irons are particularly strong. The following are cash quotations:

Nos. 1 to 6 Lake Superior Charcoal.....	\$20.50 @ \$21.50
No. 1 Strong Foundry, Bessemer quality, per ton.....	18.20 @ 19.00
No. 1 Strong Foundry, per ton.....	17.70 @ 18.30
No. 2 Strong Foundry, per ton.....	18.70 @ 17.30
No. 1 American Scotch, per ton.....	18.25 @ 18.70
No. 2 American Scotch, per ton.....	17.20 @ 17.70
No. 1 Soft Silvery, per ton.....	18.50 @ 19.00
Mahoning and Shenango Valley Neutral Mill Irons, per ton.....	16.50 @ 17.00
Mahoning and Shenango Valley Red Short Mills, per ton.....	17.50 @ 18.00

Manufactured Iron.—Common Bar at 1.70¢ is selling freely, and Sheets are in good demand at slightly advanced rates.

Scrap Iron.—Old Americans are weak and it seems improbable that the \$25 per ton rate can be much longer maintained. No. 1 Wrought is bringing \$19 @ \$19.50.

Detroit.

WILLIAM F. JARVIS & Co., under date of October 8, report as follows: Nothing of a startling nature has occurred since our report of a week ago. The volume of business has been somewhat larger and several good sized orders for Lake Superior Charcoal Iron have been booked. Most buyers have ceased to expect former quotations, but are willing to place orders at present prices for future delivery. However, very few furnacemen desire to sell for delivery after January 1st unless at an advance. The demand for high numbers of L. S. Charcoal continues, and Old Wheels are hard to secure at reasonable figures. Consumers are asking that deliveries on orders already placed be hastened, thus showing that they are using faster than was expected. For the present we quote as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @ \$20.50
Lake Superior Coke, all ore.....	19.75 @ 20.25
Lake Superior Coke, cinder mixed.....	18.50 @ 19.00
Standard Ohio Black Band.....	19.75 @ 20.25
Southern No. 1.....	17.75 @ 18.25
Southern Gray Forge.....	16.25 @ 16.75
Southern Silvery.....	17.00 @ 17.50
Jackson County (Ohio) Silvery.....	18.50 @ 19.00
Old Wheels.....	20.50 @ 21.50

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts. }
CINCINNATI, October 8, 1888. }

Pig Iron.—The market here for Pig Iron during the past week has been quiet

—that is, the volume of business has been only moderate, but there has been an active inquiry from large as well as small buyers. Most buyers, however, have made propositions based upon the outcome of the Presidential election, which sellers have been unwilling to admit. In fact, "ifs" and "ans" have been the prominent features in the business transacted. On the 1st of October the new nomenclature of Southern Coke Iron, to conform to the grading by Northern furnaces, went into effect. A firm tone has prevailed here for all kinds and grades of Iron, but changes in prices have been few and unimportant. A few 1000-ton orders of Foundry Iron have been placed, but the majority of sales during the week were small. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$17.50 @ \$18.50
Southern Coke, No. 2.....	16.50 @ 17.50
Southern Coke, No. 3.....	15.50 @ 16.00
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley.....	17.50 @ 18.50
Hanging Rock Charcoal, No. 1.....	20.50 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.50 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @ 19.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	14.75 @ 15.25
Mottled Neutral Coke.....	13.75 @ 14.00
Gray Forge.....	14.50 @ 14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 23.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

Nails.—There has been a fair volume of business without change of importance in prices. Jobbing prices are based upon 12d @ 40d, which sell at \$2.10 per keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2.10 and Steel Wire Nails at \$2.75 per keg.

Manufactured Iron.—There has been a firm tone prevailing, with some advance realized on special kinds, with a good demand for Bar, Sheet and Structural Iron. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 34¢ @ 44¢ per lb.

Old Material.—There has been a moderate demand and an easier market for Old Rails, with moderate sales at \$23, cash, but there has been little call for Old Wheels, and prices are nominal at \$19.50, cash, here.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts. }
CHATTANOOGA, October 8, 1888. }

There is no change in the movements of general trade. Matters have assumed their usual conditions, and the late scare is practically a thing of the past. The volume of business is assuming larger proportions as the fall advances. The railroad depots are crowded with merchandise, the streets are filled with drays, and the season of activity is now fully upon us. A very noticeable feature of the business that is now being done on Southern railroads, compared to what was being done 15 or 20 years ago, is the difference in the character of the freight now to what it was then. Then whole trains of cars were loaded with cotton; now the preponderance is the products of the mines and furnaces. It is not an unusual thing now to see train after train going along with nothing but coal, coke, Ore or Pig Iron, while only occasionally a train of cotton bales; and there is also this difference: the former continues the year round, while the latter occurs only late in the fall and during early winter.

Pig Iron.—The last report practically covers the situation at present, with the

difference perhaps that there is a slight falling off in the stiffness that has prevailed during the past month or two. Sales continue to be made at past figures, but are confined more to smaller lots than heretofore, while the speculative feeling has nearly subsided. Still, the furnaces are having no trouble at all in placing their entire output. The demand from Southern consumers is assuming greater activity than ever, which shows a very healthy condition of affairs. The manufacture of Sorghum Mills is now getting to be a very large item, and many carloads are being sent through the Northwest and points in the distant West and Southwest. The rules of regrading that have lately been established by the Southern furnaces have acted as a disturbing element among many Northern agents, who heretofore have been selling Southern No. 2 as No. 1, and so billing it. In fact, the system of Southern grading operated a good deal like the magician's bottle, from which whisky, wine or brandy could be had at will. If a consumer wanted No. 1, he got it; if he wanted No. 2 he got it, but got it all out of the same pile. All the furnaces that have been relined and otherwise repaired are now turning out about 10 % more than they have ever done before, and also a much better article. The new furnaces are also working up to the satisfaction of their owners.

Louisville.

LOUISVILLE, KY., October 8, 1888.

The market has been quiet during the past week, and but few sales have been made. Prices are firm. Buyers have been compelled to pay the last advance. The tendency is slightly upward, and there is a disposition among furnacemen to ask a slight advance. If a buying movement should set in this would be easily obtained. Old Rails remain firm at \$24, Wheels at \$21.

New York.

Office of The Iron Age, 66 and 68 Duane street.
NEW YORK, October 10, 1888.

American Pig.—The market is steady and firm, and in some instances more money is asked and obtained for special or fancy brands of No. 1 Foundry, which fetch from \$18.50 to \$19. Standard Irons, however, are still to be had at the old prices, at which the Thomas Iron Company are still selling. The latter have placed about 5000 to 6000 tons during the week. We are informed that the company have still Iron to sell. This is due to the fact that early in the year—in fact up to May—their customers were not taking their usual quantity, delaying and deferring deliveries, so that, coupled with a heavier output, the company have more Iron than usual to sell so late in the season. So long as these leading producers continue in the attitude of selling at old figures a general advance in the territory tributary to this market is not looked forward to. We quote: Standard to Choice No. 1, \$18 @ \$19; No. 2 Foundry, \$17 @ \$17.50, and Gray Forge, nominally, \$16 @ \$16.50.

Scotch Pig.—The market is quiet; with prices as high as they are now, it is a matter of some surprise that Eastern foundries do not follow the practice of their Western brethren of using more liberally high Silicon Irons, like the Norton in Kentucky and the Winona and Bessie in the Hocking Valley. We quote: Coltness, \$21.75 @ \$22, nominally; Shotts, \$20.75 @ \$21; Langloan, \$21, and Dalmellington, \$20.50, nominally.

Spiegeleisen and Ferromanganese.—We hear reports of sales of Spiegeleisen, principally 20 %, to Eastern and Western mills to the extent of upward of 5000 tons for forward delivery at about \$27, which remains the quotation. In Ferromanganese no business has been reported. It is stated that the foreign makers of Ferromanganese have formed a combination to hold up prices, but the accuracy of the report is questioned by importers, who claim that the rise is due to scarcity of Ore and high freights, and that any effort to control prices would have to rest first on the control of the Russian and Chili Ore deposits. We quote \$55 @ \$56 at tide for 80 %.

Plates.—We quote Iron Tank, 2.1¢ @ 2.2¢; Shell, 2.3¢ @ 2.4¢; Steel Tank, 2.2¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.65¢ @ 2.75¢, and Fire-box, 3.5¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢.

Steel Rails.—Two sales aggregating 12,000 tons are reported by two Eastern mills, the larger for a New England road, and the other for a railroad in Western New York. The latter is of special interest, because it represents one of a series of transactions brought out by the conjunction of high prices for old Iron Rails and low prices for new Steel Rails. The difference between the figures realized and paid was probably not more than \$5, inclusive of freights, so that the entire cost of relaying with steel is represented by that difference and by the cost of taking up old Iron and putting in new Steel. We understand that in this case the Iron Rails were still good for considerable service. The New England order, referred to in the above, was for winter and spring delivery, and is said to have been sharply competed for. We quote for winter deliver \$28 @ \$28.50, with rumors of sales at lower figures. We note, also, a sale of 3000 tons to a Southern road. There has been an increase of 200,000 tons in the 1888 allotment.

Wire Rods.—There have not been any sales of any consequence. An inquiry for the Pittsburgh district is in the market, but it is considered probable that it will go to a domestic mill. We quote for early shipment \$39.50 @ \$40.

Old Rails.—The market is weaker. Tees being offered at \$23.50, while the best bids are not above \$23. Business has been rendered impossible by the wide divergence in buyers' and sellers' views, and the offerings of Southern roads, two blocks, aggregating about 5000 tons, being available, have made buyers recover confidence. Considerable Old Rails have come into the market in exchange for New Rails. Thus we are told that one firm of brokers in Pittsburgh have negotiated sales of this character, aggregating fully 10,000 tons. The last of the kind mentioned is that of a road in this State who have sold 3000 tons of special quality Old Rails, still serviceable, at \$24, on line of road, and have purchased 4000 tons of New Steel Rails. Upon inquiry, we find that the difference in price between Old Rails and Muck Bar, which is considered to represent the limit where it is unprofitable

to use Old Rails, and where it pays to use Muck Bars, is about \$4 per ton. In other words, unless Old Rails are \$4 cheaper than Muck Bars, the latter are preferable. Foreign Tees are offered at \$23.50.

Fastenings.—We quote Spikes \$2.25 and Angle Bars 2.05¢ @ 2.10¢.

Cotton Ties.—Contrary to expectation, the demand has become more active, the season being late this year. We quote \$1.10 @ 1.12 ¢ bundle, New Orleans delivery.

Financial.

A severe reaction in the wheat market and a corresponding decline in breadstuffs indicate a radical change in the tone of speculation. Prices of wheat have fallen off 11¢ in two days, in a steady decline, with heavy selling orders—December weak at \$1.12. Provisions were lower, pork breaking badly on selling orders from Chicago, and lard was decidedly weak. In coffee there was a sharp advance. Cotton is dull. Raw sugars are depressed.

Nearly all markets have felt the disturbing influence of the wheat deal initiated by Chicago operators, prices for various commodities having been forced up to abnormal figures, endangering the stability of prominent mercantile firms, checking the export movement and exciting more or less apprehension concerning the future of the money market; but the consensus of opinion points to comparative ease in the immediate future. It is agreed that although the yield of wheat is below expectation, the better prices realized, together with the avails of an unprecedented corn crop, now estimated by good authorities as high as 2,210,000,000 bushels, will go far to compensate for the apparent loss. A source of satisfaction, as regards the present situation, is the settlement of most of the differences growing out of the Chicago deal without serious disaster. Taking all in all, the commercial outlook is improved. The Southern scourge is less threatening. In New York, among dry goods and grocery jobbers, with the present demand continuing, the prospects are pronounced exceedingly favorable for the remaining months of the year. Collections, aside from some delay in the South, are made with promptness. Railroads are having a remunerative traffic. The window-glass industry, employing 10,000 men, is again in full blast. The coal trade is still booming, excepting as some falling off in consumption is noticed among the iron manufacturers. Respecting the Sugar Trust, action has been taken in the Supreme Court to annul the charter of the leading refining company, upon the allegation that the combination is a criminal conspiracy under the laws of the State. On the canal, as a result of the wheat corner, the average freight rate on cereals is the lowest for any September on record, and on the lakes the lowest, with two exceptions, in 11 years.

The Stock Exchange market has been comparatively quiet, but irregular. News that the excitement in the wheat market at Chicago was subsiding had a salutary influence. Prices declined on the announcement of an advanced rate by the Bank of England, but soon recovered. On Friday the feature was a rise in New England, based on the prospective importance of the road in coal transportation. On Saturday the market was weak and lower. On Monday orders from London caused firmer prices, and Treasury purchases of bonds operated favorably, but trading was dull. On Tuesday the market was irregular but strong at the close. A special shipment of \$500,000 in gold, was regarded as of no significance.

United States bonds are quoted as follows:

U. S. 4½s, 1891, registered.....	108½
U. S. 4½s, 1891, coupon.....	108½
U. S. 4s, 1907, registered.....	129
U. S. 4s, 1907, coupon.....	129
U. S. currency 6s.....	121

The weekly bank statement showed a decrease of \$3,339,675 in surplus revenue, which now stands at \$11,417,500, against \$8,112,770 at the corresponding date last year. The special feature was the large increase in the amount of loans, equal to \$4,920,100, which is due partly to improvement in general trade but mainly to speculative activity in grain. Specie decreased \$423,200; the legal tenders are down \$1,904,600, the deposits other than United States increased \$4,047,900. A continued heavy demand for funds in the interior was offset to a large extent by purchases of bonds by the Treasury. Monday's bond purchases, aggregating \$3,783,100, made up the full requirement for the sinking fund, about \$48,000,000. The Secretary on Tuesday accepted an additional \$7,174,350. All purchases since June 30 have been applied to this purpose. Purchases from now on will be optional with the secretary, but there is reason to believe that he will pursue a liberal policy, and that undue stringency while the fall trade is in progress will be obviated. During the month of August the quotations for 4 per cents varied from 127½ to 128½, and the average rate of interest realized by purchases is computed at 2.215 %. The 4½ per cents varied from 107½ to 107½, and the rate of interest realized would average 2.188 %. Time rates for money in this market are quoted 4 @ 5 % for four and six months, but the demand is light. Rates for commercial paper are, for 60 and 90 days, 4½ @ 5½ %; longer dates 6 @ 7 %. The advance in the Bank of England rate of discount to 5 %—the highest since February last year—induced the leading drawers of sterling exchange to put up the nominal figure for demand bills to \$4.89. The posted rates are now \$4.84½ and \$4.89. The Bank of France advanced its rate to 4½ %. A London dispatch speaks of the probability of a further advance in the Bank of England rate, which, "it is calculated, will cause gold shipments from New York." The London Times says that the total shipments to Buenos Ayres will be £3,000,000. The exports of specie from New York during the week were \$425,000, and the imports \$136,000. The recent advance of about 5 % in the silver market is attributed to simultaneous orders to purchase given by several European governments. A further slight advance would bring silver from India.

Clearing-house returns now are materially increased compared with 1887, for the first time this year. The aggregate for 38 cities shows an increase of 18.9 %; outside of New York the gain is 16.1 %; New York increased 20 %; Boston, 21.3 %; Philadelphia, 7.5 %; Chicago, 39.4 %; St. Louis, 11.9 %; San Francisco, 10.9 %; Baltimore, 9.2 %; Cincinnati, 1.1 %. New Orleans, decrease, 12.5 %; St. Paul, 3.3 %; Minneapolis, 2.7 %; Memphis, 19.3 %, and Wichita, 22.7 %.

The imports of merchandise at this port during the week were valued at \$7,811,178, of which \$2,000,000 represent dry goods. Since January 1 the total is \$359,952,000, as compared with \$363,030,000 for the same time last year. The exports were \$5,887,711.

The American Bankers' Association, which has a membership of 1700, held its annual convention in Cincinnati last week, Logan C. Murray, of New York, delivering the annual address. Charles Parton, of St. Louis, was elected president and John J. Knox is chairman of the Executive Committee.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from October 1 to October 4, inclusive, and from January 1 to October 4, inclusive, were as follows:

Coal Market.

The Anthracite Coal trade is marked by the same characteristics noted for some time past. There is an easier tendency for most sizes, but prices generally are firmly held, and a fair business is in progress on the latest schedule basis. Deliveries are pressed actively, mainly in filling former orders, and in the East and interior points there is special anxiety to complete shipment while navigation remains open. Stove Coal is scarce, most of the producers being out of the market. Egg is a little stiffer. Broken and all other manufacturing sizes are easy. Pea and Buckwheat are a drag. Broken is cut a little. Altogether the trade is considered in good condition. Production is still heavy, but for the week, there is a decrease of about 60,000 tons compared with the previous week, the total being 828,636 tons, but this amount is 100,000 greater than for the corresponding week last year. Since January 1 the aggregate is 28,444,077, an increase of upward of 2,340,000 tons compared with 1887. This extra output goes West, where the demand has been unprecedented. It is estimated that the West this year will take near 2,000,000 tons. Quotations are as follows: Hard White Ash, Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Fine White Ash, Broken, \$3.95; Egg, \$4.30; Stove, \$4.65; Chestnut, \$4.55.

The production of Anthracite Coal for the year to October 6 compares with 1887 as follows:

	6,424,833	7,178,608
Schuylkill.....	5,498,008	5,541,144
Lehigh.....	16,521,236	18,378,497
Wyoming.....		

Total..... 28,444,077 26,068,234

A large contract was awarded to A. H. Church, of Ashland, by the Reading, to strip the mammoth vein at Mahonoy City Colliery. It will require one year to complete the task. Two million tons of Coal will be secured from it, and the cost will be only about one-third that of mining by the common method.

The New York Brokers' and Freighters' Exchange has been organized to promote

the general freighting interest in the harbor of New York. Officers are: O. C. Hanchett, president; Geo. W. Kellam, secretary; Thos. Dennin, treasurer.

Bituminous Coal is active on pool basis of \$3.25 f.o.b. The lack of transportation is still a cause of complaint. The growth of the trade is remarkable. Cumberland reports for the year to September 29, 2,653,000 tons, against 2,370,000 tons for the same time in 1887, and Clearfield, 2,528,000 tons, against 2,357,000 in 1887.

Metal Market.

Copper.—At the time of our last week's report, spot Chili Bars were still £96; this morning they are £82 in the London market, while futures declined from £79. 10/ to £77, and good merchantable brands from £78 to £77. 7/8, only Best Selected remaining £82, unaltered since then. The London and Continental bears having been punished, spot Bars have taken range again with other Copper. Here the dealings in Copper have almost come to a complete standstill; yesterday a local dealer sold December to the syndicate at 17½¢; the latter maintains its spot price at 17.75¢. Casting brands are bringing 16¢ with ease. It is reported from Boston that the Calumet and Hecla Stamp Mills produced in 24 hours, ended at noon on Tuesday of last week, 140 tons of mineral, the largest output for one day in the history of the mine, and yielding over 200,000 lb of Fine Copper. The total profit on this one day's output is figured at fully \$18,000.

Tin.—Has fluctuated but little in London. Spot stood a week ago £101. 15/, and has given way gradually to £100. 17/6 this morning, while futures dropped but slightly, from £101. 15/ to £101. 5/. The trade here has been quite tame, the sales on 'Change being restricted to 60 tons all told, of which 20 prompt shipment at 23¢ yesterday and 10 tons at 23.10¢. The spot price is this morning 23½¢, at which the market winds up dull. September shipments from the Straits this way were 750 tons, against 450 last year, and 1300 to England, against 1200; since January 1, respectively, 2200 tons, against 4000 tons, and 13,700 tons, against 10,000 tons. **Tin Plates.**—The market has not been quite as firm as of late; the productive capacity of South Wales is evidently gaining on consumption. The demand here has been very moderate both for spot and futures. Liverpool has given way from 14/ to 13/3 @ 13/6 with Cokes. We have to reduce to-day some of our last week's quotations, they are now as follows for large lines, per box: Siemens-Martin Steel, Charcoal finish, \$5.25 @ \$5.75; Coke finish, \$4.70; Terns, \$4.25 @ \$4.35; Bessemer Cokes, \$4.50 @ \$4.55, and Wasters, \$4.30.

Lead.—The bull speculation in Lead seems to have spent itself for the moment. On 'Change 400 tons changed hands, and 100 tons in the open market, down to 4.90¢, at which the market closes flat. Manufacturers are trying to get along as well as they can without appearing in the market as buyers, the corrodors state they need not buy for a month to come to prepare for their spring demand, and the entire situation is devoid of either life or strength. In London Soft Spanish has remained steady at £14. 10/, and English Pig at £14. 15/. The flurry there, while it lasted, we perceive from accounts by mail, was due to buying for American account. St. Louis and Chicago are both 4.90¢.

Spelter.—A moderate consumptive demand has been filled in this city at 5½¢ @ ½¢. Common Domestic, Selesian being held at 6¢ @ 6.05¢; London giving way from £19. 2/6 to £19 in the meantime.

Antimony.—A fair demand has kept Cookson at 12¼¢ and Hallett at 10¼¢; the latter is unaltered at £42 in London.

New York Metal Exchange.

The following sales are reported:

THURSDAY, October 4.	
16 tons Lead, October.....	5.00¢
16 tons Lead, October.....	4.97½¢
32 tons Lead, October.....	4.87½¢
16 tons Lead, October.....	4.92½¢
214 tons Lead, October.....	4.95¢
16 tons Lead, November.....	4.85¢
FRIDAY, October 5.	
48 tons Lead, October.....	5.05¢
16 tons Lead, October.....	5.07½¢
16 tons Spelter, spot.....	5.10¢
10 tons Tin, November.....	22.95¢
SATURDAY, October 6.	
20 tons Tin, prompt shipment.....	23.00¢
100 tons Lead, spot.....	5.10¢
MONDAY, October 8.	
10 tons Tin, November.....	23.10¢
32 tons Spelter (prime Western).....	5.10¢
TUESDAY, October 9.	
100,000 lbs. Lake Copper, December.....	17.50¢
100 tons Lead, spot.....	5¢
WEDNESDAY, October 10.	
81 tons Lead, October.....	4.90¢

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]
LONDON, WEDNESDAY, Oct. 10, 1888.

The open market price for Chili Bar Copper for prompt delivery has receded £12 @ £15 during the week, but the lowest "official" price is still considerably above that at which the syndicate have made sales to consumers. The cause of the decline is doubtless the fact that there have been comparatively few "short" sales to cover this month, the "bears" doubtless being satisfied that endeavors to break the market by selling futures entangles themselves only. Consumers are said to have purchased more freely of Chili Bars the past two or three weeks than for some considerable time previous. Where satisfactory guarantee was given that the Copper purchased would go into consumption, the syndicate sold at £78 for prompt or future delivery. It is stated now that 105,000 to 110,000 tons can be located as in the hands of the syndicate. During the past month about 218 tons American Ingot have been added to the stocks in store in England. The report has circulated that the syndicate will cancel recent contracts made on payment of £20 [cable is somewhat obscure on this item.—EDITOR]. There has been a revival of reports to the effect that a new combination is forming to take up the contracts made in the name of the Société des Métaux. It is now stated that an organization known as the Société Civile is practically formed and will relieve the Société des Métaux of its obligations with the various Copper mining companies. There does not appear to be any apprehension that existing contracts will be at all unfavorably affected by the proposed transfer.

The Block-Tin market has been affected in a measure by somewhat adverse statistics, but subsequently recovered, although the demand has shown no material improvement. There is little or no change in the situation from the strictly speculative standpoint.

The demand for Tin Plate has been fairly active. Intending buyers invariably find makers indifferent, owing to the fact that their books are full, and disinclined to take any further orders of any

magnitude pending the quarterly meeting, to be held on the 11th inst. The total stock at British shipping points is returned as 191,000 boxes, against 199,750 last month and 236,000 in August. The stock last year was 199,000 boxes. The exports to America during September were 26,000 tons.

Webb, Shakspeare & Williams are adding two new establishments to their works (the Glamorgan), at Pontardulais, and will soon have a total of five mills in operation.

Scotch Pig Iron warrants have continued more or less depressed under the weight of anxiety to realize, quite heavy sales for makers' account and renewal of quite heavy storing. The decline on "warrants" has unfavorably affected the market for makers' brands. Some large sales were made early in the week, but buyers are placing very few orders at the present time. The exports of Pig Iron to the United States last month were 12,000 tons, against 10,000 in August. Prices are somewhat lower on most brands of Scotch, but no further change is reported on Middlesboro' or Bessemer Pig. Spiegeleisen is again higher, on good demand and moderate offerings.

There is no abatement of the activity in the Manufactured Iron branch and prices are very strong all through. The Staffordshire Marked Bar houses have advanced prices 10/ and Common Bars and Black Sheets are about 5/ higher. The demand for nearly all lines of Steel continues brisk, but prices show some irregularity. All late difficulties with workmen have been adjusted. On Rails there has been a partial recovery of last week's decline. Blooms, Billets, Slabs and Wire Rods are held somewhat higher.

Scotch Pig.—The market very irregular, and business smaller than previously:

No. 1 Coltness, f.o.b. Glasgow.....	50/
No. 1 Summerlee, " ".....	51/
No. 1 Gartsherrie, " ".....	47½
No. 1 Langloan, " ".....	49/
No. 1 Cambro, " ".....	43/
No. 1 Shotts, " at Leith.....	48½
No. 1 Glengarnock, " Ardrossan.....	46½
No. 1 Dalmeilington, " ".....	42½
No. 1 Eglinton, " ".....	41½

Steamer freights, Glasgow to New York, 10/ Liverpool to New York, 10/.

Cleveland Pig.—Prices without change but the market rather weak and slow. No. 1 Middlesboro', G.M.B., 37/; No. 3 do., 34/6.

Bessemer Pig.—There has been only a fair demand. Prices show little change. West Coast brands, mixed numbers, 44/6, f.o.b. shipping point.

Spiegeleisen.—Demand has been more active, and a further advance in prices is asked. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—Business is of good volume and prices are firmer. Standard sections quoted at £3. 18/9, f.o.b. at N. W. England shipping point.

Steel Blooms.—The market firm and demand good. We quote £4. 2/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—Demand fairly active and the market firm. Bessemer, 2½ x 2½ inch, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—A moderate business, but prices firm. Bessemer, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—The demand moderate, but sellers very firm. Mild Steel

No. 6 quoted at £5. 19/6 and No. 5 at £5. 18/6, f.o.b. at N. W. England shipping point.

Old Rails.—Very little doing and prices nominal. Tees held at £3. 2/6, and Double Heads £3. 5/, f.o.b.

Scrap Iron.—A moderate business at previous prices. Heavy Wrought quoted at £2. 5/, f.o.b.

Crop Ends.—The market quiet and unchanged. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Manufactured Iron.—Market strong and active, with prices 2/6 @ 10/ higher. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars.....	£ s. d.	£ s. d.
Common.....	@ 8	2 6
Staff. Bl'k Sheet, singles.....	@ 5	5 0
Welsh Bars (f.o.b. Wales).....	@ 7	7 6
	@ 4	17 6

Tin Plate.—Business restricted by wide difference between buyers' and sellers' views. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/6 @ 16/
IC Bessemer steel, Coke finish.....	14/3 @ 14/6
IC Siemens.....	14/6 @ 14/9
IC Coke, B. V. grade.....	14/ @ 14/3
Charcoal Terne, Dean grade.....	12/6 @ 13/

Tin.—The market has been fairly active. Straits quoted at £101. 5/, spot, and £101. 10/ for three months' futures.

Copper.—Somewhat irregular market. Business moderate. Chili Bars, £78, spot, and £78. 10/ three months' futures. Best Selected, £81.

Lead.—The market quieter and not so firm. Soft Spanish, £14. 10/.

Spelter.—Demand continues good and the market firm. Silesian, ordinary, £19. 2/6.

EAST INDIES.

SINGAPORE, August 22, 1888.—Tin.—Our last report was dated 8th inst., since when prices have fluctuated between \$34.87½ and \$37.37½, closing with sellers at \$35. Sales aggregate 400 tons, and supplies are coming to hand pretty freely. **Gum Copal.**—A small business has been done for the United States at \$11.12½ for the best quality. In **Gum Damar** nothing was done in the interval. **Tonnage.**—London rates are steady at 27/6 @ 30/ for weight. For New York via Canal there is no tonnage offering; via the Cape the Tabique will clear shortly, and the Sonntag has commenced loading; rates are unchanged. **Exchange** is steady at 3/1½ for six months' sight credits. The Tin shipments hence, so far in August, have been: Per steamer Waverley to San Francisco, 50 piculs; per steamer Glenartney to New York, 422; per steamer Bonlawers to ditto, 1683, and per ship Hoogly to Boston, 253, making total shipments since January 1 19,348 piculs.—*Giffillan, Wood & Co.*

SINGAPORE, October 4, 1888.—Tin.—The September shipments from the Straits Settlements to the United States have been 750 tons, against 450 in 1887, and to England 1300, against 1200. Since January 1 the shipments have been respectively 2200 tons against 4000, and 13,700 against 10,000.—*Giffillan, Wood & Co., to Mr. Charles Nordhaus, 89 Water street, New York, per cable direct.*

MANILA, October 1, 1888.—Hemp.—Buyers are ready to pay \$10.25, against \$11 same date last year, per picul, which equals, cost and freight per ton, £38. 17/6, against £38. 17/. The clearances to the United States since last cable amount to 10,000 bales, against 5000 in 1887, and, since January 1, to 147,000, against 159,000. There remain loading for the same destination 37,000 bales, against 56,000; cleared for England since January 1, 252,000, against 161,000; loading for ditto, 13,000, against none; cleared for all other countries, 55,000, against 30,000; receipts at all ports since last cable,

12,000, against 13,000; ditto since January 1, 400,000 bales, against 380,000 in 1887 and 305,000 in 1886. **Freight**, \$6, against \$5.50. **Exchange**, 6 months' sight, 3/5¼, against 3/8¼.—*Ker & Co., to Mr. Charles Nordhaus, 89 Water street, New York, per cable direct.*

JAPAN.

YOKOHAMA, August 15, 1888.—Petroleum.—The first cargo of Russian Refined Petroleum ever imported here direct from Batoum, per British steamer Monarch, consisted of 67,000 tins containing 536,000 gallons. It had been shipped on an order from Jardine, Matheson & Co., of China, by the Baku Commercial and Industrial Company. Upon arrival of this large supply in a lump American refined declined 5¢ per tin. This shipment is to be followed by a larger one from the same source and parties, and the competition between the two sorts will thus be permanently established, much to the benefit of consumers.—*Japan Mail.*

SPAIN

BILBAO, September 22, 1888.—Iron Ore.—Our market has been active during the week at 7/6 @ 8/ Campanil, and 6/10 @ 7/3 Rubios, with several cargoes sold besides on private terms, total shipments for the week figuring up 80,000 tons, thus aggregating since January 1 2,717,879 tons, against 3,208,436 in 1887. **Pig Iron.**—Shipments amounted to 1000 tons abroad and 830 coastwise.—*Bilbao Marítimo y Comercial.*

SWEDEN.

STOCKHOLM, September 28, 1888.—Iron Ore.—The Lulea Ofoten Railroad Company, while still negotiating with the Government to get its Steel Rails admitted duty free, now also demands that the rolling stock it requires enjoy the same privilege. There have been landed at Lulea 89 cars from England on which the duty amounts to 31,000 crowns of 28¢ American, and as the company have refused to pay the duty on the same, they have been seized by the Customs' authorities; 150 cars additional have arrived since per steamer. The company employs at present 3000 workmen, 200 of them being miners in the Iron Ore mines. There are laid so far, starting from Lulea, 218 km. of railway, 13 of which above Gellivara. Exportation of Iron Ore to date amounts to 38,000 tons. The Provincial assembly at Noerbotten voted a subsidy of 100,000 crowns six years since, and this money is now to be paid the above railroad company.—*Dagbladet.*

ITALY.

MILAN, September 27, 1888.—Iron.—A new iron works is to be founded in this city, with a share capital of 2,000,000 lire or francs, to be commenced with, but to be eventually increased. It is stated that a new process is to be introduced. The plant is to be large enough to be able to employ 500 operatives.—*La Patria.*

GERMANY.

HAMBURG, September 29, 1888.—Iron.—The demand for Pig Iron has been steady in Rhenish-Westphalia, but not active enough to prevent a gradual increase of stock. Larger orders for Spiegel have been received from the United States and elsewhere abroad, and there is an improved tendency therein in consequence. The quotation is 53 marks per ton for 10 to 12 % Manganese. Forge Pig continues dragging at 46 @ 47 marks at Siegen; rolling mills only buy to cover current requirements. Bessemer is duller, Thomas as lively as ever. English Bessemer commands 45/6 @ 46/ on the West Coast. The local inquiry for Merchant remains satisfactory, but there is none for export. The same activity as heretofore is kept up in Boiler Sheets; Thin Sheets are slightly better at 149 at Siegen. The Wire branch is also slightly looking up. Foundries, machine shops and Car works are all doing well. The foreign iron movement in Germany during the first seven months has been as follows:

	1888.	1887.
Tons.	Tons.	
Pig Iron, Scrap, Billets and Rails.....	101,940	199,902
Hardware, special Irons, Sleepers and Castings....	482,277	541,489
Totals.....	584,217	741,391
Import.		
Pig Iron, Scrap, Billets and Rails.....	116,320	84,258
Hardware, special Irons, Sleepers and Castings....	26,020	28,358
Totals.....	142,340	112,616

The import of Locomotives and Steam Engines increased from 18,199 tons to 23,266, and the export from 42,017 to 47,335. The export of Sewing Machines rose from 3827 tons to 4342. The import of Iron Ore increased from 604,548 tons in 1887 to 710,143 in 1888, and export from 992,109 to 1,257,065. **Metals.**—All metals have been steadily improving and remain firmly sustained.—*Borsenhalle.*

A New Swedish Rapid-Firing Gun.

At the Copenhagen Exhibition is shown the first specimen of a new Swedish rapid-firing gun, designed by Mr. Harald Thronsen and manufactured at the Finspong works, Sweden. This new gun is capable of firing 18 shots per minute with one man, while with two men it has a capacity of one shot every other second, or 30 shots per minute. The gun exhibited at Copenhagen has a caliber of 47 mm.; its entire length is about 52 calibers and the distance from the base of the projectile to the mouth of the barrel is 40 calibers. There are five different projectiles shown—viz., solid shot, steel shell, chilled point cast-iron shell, common shell and shrapnel, with 64 small projectiles; the weight is the same for them all—viz., about 3.3 pounds (or 1.5 kg.). The muzzle velocity is 2141 feet (657 m.) per second, with a charge of 750 grams of Swedish field-artillery powder; the maximum pressure in the barrel has been 2300 atmospheres. The mechanism is both simple and strong. The Finspong gun is mounted on a pivot carriage, so that it can be worked in all directions. It has a shoulder piece about the size of the butt end of an ordinary rifle, against which the man who works it places his right shoulder, and, with the right hand, he holds the trigger, or, if he works the gun by himself, works the lever that moves the eccentric, while the left hand rests on another lever, which, when pulled toward the man, acts as a brake and fixes the gun in any position and in all directions, so that several shots can be fired against a certain point, without it being necessary to repeat the aiming for each shot. The gun shown at Copenhagen has a screen of plate iron, but otherwise the gun is able to produce all-round fire. The material of the gun is wrought Martin steel.

The Largest Quick-Firing Gun in the World.—According to *Iron*, of London, extended trials are now being made by the naval gunnery experts of a new quick-firing gun which has a caliber of 6 inches, and is designed for projectiles weighing 100 pounds each. The gun is the invention of Sir W. G. Armstrong's firm at Elswick, and has already been exhaustively tested on their private range at Siloth. The specimen gun furnished for the naval trials has been mounted on board the Hector, an old armor-plated battleship, and some of the armor plates have been stripped off to enable a special port to be constructed which will admit of the special mounting of the gun being used to the best advantage, and will also provide security for the gunners against shell and machine gun fire from an enemy's ships. If the trials are successful, this powerful weapon will be used for the battery armament of the Nile and Trafalgar, and for the main deck batteries of the new fast cruisers, Blake and Blenheim.

Senator Wilson has been informed by Assistant-Secretary Maynard that the phraseology of Section 2510, R. S., providing for the importation in bond of "iron and steel rods, bars, spikes, nails and bolts, to be used in the construction and equipment of certain vessels," is not understood by the Treasury Department to include steel beams or what is called structural iron, but that under the regulations prescribed in pursuance of said law, steel and iron imported in shapes specified in the statute may be withdrawn for conversion into beams or other articles to be used in the construction, equipment or repair of such vessels, in which case the duties paid on the materials so withdrawn, manufactured and used are refunded in full.

Hardware.

The condition of business thus far in the present month is generally referred to as fairly satisfactory, there being a good though not exceptionally heavy trade in most lines. It is evident that the trade throughout the country are purchasing cautiously, not being disposed to exceed their near wants, and the stock of goods with both jobbers and retailers is regarded as generally light. Prices in most lines remain without change, being on nearly all staple goods the price of which is not artificially controlled, about as low as the profitable production of the goods will permit.

Barb Wire.

The New York market remains without change with a moderate business. Carload lots of Four-Point Galvanized are quoted at 3.6 cents, with about the usual advance for small lots.

The proposed organization of the Barb Wire manufacturers is understood to have been abandoned. This result was most unexpected to the gentlemen who met in Chicago on the 12th ult., by whom a plan of organization had been devised which met with the approval of every one present. All previous attempts to harmonize the trade had originated mainly with the small manufacturers, who could not secure the co-operation of the necessary number of the leading establishments, but this last effort sprung from some of the largest concerns, who were makers of the raw material as well as fencing. This fact gave the project an assurance of success, which appeared to warrant the sanguine expectations published at the time. The Barb Wire manufacturers generally were heartily disgusted at the profitless condition into which the trade had been plunged by excessive competition for business, without regard to the cost of production, and on all sides a feeling of satisfaction was expressed that a tangible method of relief had been devised. But when it was attempted to put the plan into effect an unaccountable indifference was manifested, even among those who were loudest in their expressions of approval, and the scheme was reluctantly given up. It is singular that the members of this important branch of industry are willing to allow it to continue still longer in its demoralized condition. Possibly each one feels himself able to stand the pressure until some of his competitors are obliged to drop out of the race, after which the business will right itself through the diminution of production and prices will advance to a profitable point. This seems to be the only explanation. At present the price of Plain Wire is advancing, but Barb Wire is kept down, some sellers offering the latter at a price below the cost of production by the best mills.

Wire Nails.

The existing arrangement between the leading manufacturers is reported to be working satisfactorily and prices are well maintained. The large quantity of Nails sold at the lower figures ruling previous to the recent advance enables buyers in some cases to purchase advantageously from second hands. Prices are \$2.55 for carload lots, and \$2.65 for small lots.

Cut Nails.

Although the volume of business is quite satisfactory and there are other encouraging features, the price of Cut Nails in the New York market remains still low, carload lots being available at \$1.85 on dock for Iron Nails, while Steel Nails are stiffer. Two of the mills represented in this market have lately been buyers instead of being sellers, one of them on account

of a strike. One Western mill which competed sharply, particularly at New England points, among them Springfield, Mass., has practically withdrawn, so that the number of cheap-sellers has narrowed down to a few. Nails, especially in the East, have occupied an exceptional position for some time past. While other allied industries have had the benefit of a rise—Bars, Skelp and other classes of material are above the lowest point—Nails are stationary in spite of higher raw materials. Taking the price realized on an average specification, extras included, at \$2 per keg at mill, and deducting the cost of keg, 12 cents, and cutting, 32 cents, the Iron fetches only 1.56 cents per pound. A comparison of this figure with the selling price of Bars, Skelp, &c., will show how exceptional is the position of Nails.

Miscellaneous Prices.

Last Thursday an advance was made in Shot, the present quotations being subject to a discount of 2 cents for cash in five days:

Drop Shot, per 25-pound bag.....	\$1.50
Drop Shot, per 5-pound bag.....	.35
Buck and Chilled, per 25-pound bag.....	1.75
Buck and Chilled, per 5-pound bag.....	.40

The price of Lead Pipe and Sheet Lead has also been advanced $\frac{1}{2}$ cent per pound, present prices being Pipe, $7\frac{1}{2}$ cents, and Sheet, $8\frac{1}{2}$ cents.

A meeting of the Carriage Trimmers' and Hardware Manufacturers' Association was held in the Hotel Anderson, at Pittsburgh, on Wednesday, the 3d inst. The condition of trade, which is reported to be only fair at present, was fully discussed, and the opinion prevailed that an improvement can confidently be expected at an early day. A new schedule of prices was submitted to the members, but not adopted. Some routine business was transacted, and the meeting adjourned to reconvene at the call of the secretary.

Stuart & McLean, Pittsburgh, Pa., are sending out to the Western and Southern trade circulars quoting prices on various lines of Hardware. They make a specialty of goods manufactured in and about Pittsburgh.

On the 3d inst. a meeting was held at the Grand Pacific Hotel, Chicago, of the executive and business committees of the Manufacturers' Association of Brass and Iron Steam, Gas and Water Fittings, to take action regarding a proposed increase of prices to meet the increased cost of copper. The association represents 85 per cent. of the total product annually marketed in the United States. A very thorough discussion took place in which all phases of the situation were carefully considered. It was found that some articles were being sold below the cost of production, while all others in which copper is used are marketed at a price affording but a bare margin of profit. It was determined, however, to maintain the present discount sheet until the annual meeting in New York, December 12, for the reason that the manufacturers outside the pool, representing about 15 per cent. of the product, are still keeping their goods at the present competitive rates, and the pool cannot afford to give them an advantage. Arrangements, rates and other questions were also considered, but no definite action was taken on them.

The general quotations for Wire remain without change, and there has been a withdrawal of some of the extreme prices which have recently been made by some of the manufacturers.

A disposition on the part of the manufacturers of heavy goods lying near the raw material to make slight advances is apparent, and in several lines some exceptionally low quotations have been withdrawn.

The price of the Arctic Ice Dogs, described on page 568, and manufactured by Geo. A. Waller, Seneca Falls, N. Y., is \$6 per dozen pairs, subject to a discount of $33\frac{1}{4}$ per cent.

Trade Topics.

From Fred P. Straub & Co., Evansville, Ind., we have received a carefully compiled and very interesting table relating to their purchases of goods during the 30 years in which they have been in business. From its bearing on the movement of trade and the relative positions occupied by manufacturers and jobbers in the distribution of Hardware to such representative houses, it will be of unusual interest and suggestiveness. The table, which is reproduced below, is, it will be observed, arranged so as to show the purchase of each year, and the percentage of goods purchased from manufacturers and jobbers, while at the same time it indicates the proportion purchased from Eastern and Western manufacturers and jobbers, respectively. The line of division between the East and the West passes through Buffalo and Pittsburgh, both of these markets being included in the West. In the column allowing purchases from Eastern jobbers purchases of imported Hardware are also included.

Percentage of bills purchased of—

Year.	Manufacturers.			Jobbers.		
	Eastern.	Western.	Total.	Eastern.	Western.	Total.
1858..	15	36	51	13	36	49
1859..	12	39	51	22	27	49
1860..	28	37	65	9	26	35
1861..	14	50	64	3	33	36

From this table it is evident at a glance that there has been a marked increase in the proportion of goods purchased direct from the manufacturers, with, of course, a corresponding decline in the amount of purchases from the jobbers, during the first ten years the average annual purchases from manufacturers amounting to 61 per cent., and during the last ten years to 79 per cent. It is, however, to be noticed as interesting and perhaps significant that during the present year up to date at which the table closes, September 28, the purchases from jobbers are represented by 28 per cent., the largest proportion in 20 years.

It is also interesting to notice the relation borne by manufacturers and jobbers in the East to their Western competitors, and it will be seen that the Eastern manu-

facturers have more than held their own, their average sales during the last ten years being 37 per cent., as against 24 per cent. the first ten years, a proportionate gain of more than 50 per cent, while during the last ten years the average sales by the Western manufacturers were 42 per cent., as against 37 per cent. in the first ten years, being a gain of less than 15 per cent. With reference to the purchases from the Eastern and Western jobbers, the result is, perhaps, still more surprising, there being a slight increase in the proportion of business done by those in the East, while there has been a marked decline in the proportion of purchases from their Western competitors, from whom the first ten years an average of 27 per cent. of goods was purchased, while the average has been only 8 per cent. in the last ten years.

It would obviously be unsafe to take the experience of any one house as indicating the general features of the trade, but in some points we doubt not that this table represents a quite general tendency in business, especially in regard to the increased disposition on the part of houses of like standing to purchase direct from manufacturers. With the rapid extension during recent years of manufacturing enterprises in the West, it would be surprising if, in the experience of many hardware houses, the Western manufacturers did not receive a larger proportion of business than in this instance appears to have been the case. But on this subject we shall be glad to hear from the trade, especially as relates to the tendency toward purchases from manufacturers, and whether the East is holding its former proportion of business. It is hardly to be supposed that many Hardware houses are as painstaking and systematic in analyzing and recording such matters as are the correspondents to whom we are indebted for this interesting contribution, but many of our readers who have observed the tendencies of trade are in a position to give facts and impressions which will be of general interest. The subject is a broad one, and has a practical bearing upon the business of the manufacturer, jobber and retailer.

Items.

The Iowa Farming Tool Company, Fort Madison, Iowa, have issued their illustrated catalogue, for the season 1888-1889, in the form of a beautiful light-printed pamphlet of very fine paper. Their extensive works are illustrated, their code given, and their regular line of Steel and Wood Goods, Wheelbarrows, Ox Yokes, &c., are represented. In the circular that accompanies the pamphlet they allude to the advantage of buying where a full line is made, where Snaths and Cradles and Steel Goods are all of one make and label.

The E. C. Meacham Arms Company, St. Louis, Mo., have issued, under date October 1, their catalogue No 383, in which a large line of Fire Arms and Ammunition is compactly represented. It is prefaced by a key to the quotations, which are given in characters, as usual with the company.

The Marlin Fire Arms Company, New Haven, Conn., in their 1888 catalogue call special attention to the Marlin Repeater, Model 1888, which has recently been put on the market, and also illustrates the Marlin Repeater, Model 1881, Ballard Rifles and Marlin Double-Action Revolver. Full information is given in regard to these different Arms and some related goods.

The Canton Saw Works, Canton, Ohio, in addition to their Sickle Edge Band Knives, Rolling Coulter, &c., have recently put on the market the Novel Sec-Saw and Merry-Go-Round, intended for nursery use. It is 6 feet long, supported

on an iron standard, and has a seat adapted for children only. A larger size for the lawn and play room is 8 feet long and has seats for grown persons.

Tower & Lyon, 95 Chambers street, New York, have issued a catalogue devoted to Tower's Police Equipments, showing a line of Shields, Revolvers, Clubs and Belts, Adjustable Hand Cuffs, Leg Irons and Nippers, one of which, it will be observed, is described on page 74.

Pugsley & Chapman, 8 Liberty street, New York, issue a sheet showing the goods of their manufacture together with many others, including some well-known articles.

The Hart Hardware Company have recently begun business at Lincoln, Neb., as jobbers of Shelf and Heavy Hardware. L. C. Hart is president of the company from whom it receives its name; E. P. Berryman, vice-president; A. L. Havens, secretary; J. T. Clark, treasurer; William Patterson, manager. The authorized capital is \$200,000, \$100,000 being paid up. The company will occupy rooms in the H. T. Clark building on the corner of Eighth and P. They have four floors, each 50 x 100, and below this a basement 14 feet high and 50 x 125 in size. Just at the back door is the private track belonging to the building, and from this track large shuttes lead directly into the basement for the unloading of all heavy goods. They will do an exclusively wholesale business, for which they will have the best facilities.

A new Hardware jobbing house is to be started at Omaha, Neb., on the 1st of January. It will be composed of a number of gentlemen connected with other Hardware establishments, who propose to engage in business on their own account. It is reported that it will have a capital of \$360,000, of which \$200,000 will be paid in. The name of the company has not been announced.

It is announced that George E. Bristow, of Providence, R. I., has been elected treasurer of the Nashua Lock Company, Nashua, N. H., in place of H. G. Bixby, resigned.

The Union Indurated Fibre Company, New York, issue monthly a sheet of new lines. September sheet offers Slop-Jar Mats, a line which will be readily recognized as serviceable and durable in this ware. Only one size, 21-inch, is ready. Store barrels and covers of this material are also offered in various sizes. One new size of Keelers is added, making a very complete assortment in this line, and Butter Tubs are also offered. One size only is ready, 25-pound Tub. These are described as far superior to arid much cheaper than stoneware, wooden or other new Tubs, as light, easily kept sweet and clean, not easily broken, not affected by the brine and imparting no taste to the butter.

Oliver A. Smith, Clarkston, Mich., issues a circular relating to his Iron Land Roller and also to the Dakota Roller. The special features of these implements are explained.

C. F. Guyon & Co., 97 and 99 Reade street, New York, have been appointed agents for the Middle and Southern States for the Hot-Air Registers and Ventilators manufactured by the Chicago Sewing Machine Company. The manufacturers in a recent circular call attention to a few points in the construction of these goods, mentioning among others that their Registers are of the standard measurements, thus making them interchangeable with other goods; that the position and noiseless movement secured by their patent deserves particular attention, and that the

permanent fastening is a very simple device, which can be attached at a small expense. The weight of the castings is also alluded to, as well as the fact that being made with four fans instead of three they are more easy of adjustment in dwellings.

The Twisted Wire Box Strap Company, corner Greenwich and Desbrosses streets, New York, issue a convenient pamphlet relating to their Twisted Wire Strap. A list is given of some of the principal firms using this Strap, with testimonials from a number of merchants and manufacturers, some of whom are well known to the Hardware trade.

Since their reorganization last May the Sterling Wrench Company, Sterling, Ohio, advise us that they have made improvements in the style and quality of their Wrenches, and allude to the success which they are now meeting. Their new Agricultural and Machinists' Wrench is described as having a handle like the Coes Wrench, and solid steel screw. It is intimated that still further improvements in this line are contemplated, and that a new special Wrench will soon be put on the market. Their circular mentions that, having made additions to their machinery, they now have a capacity of 50,000 per month.

By the announcement on page 56 it will be observed that the Le Page Company, Gloucester, Mass., for whom the Maltby-Henley Company, 20 Warren street, New York, are agents, are offering the Nameless Glue in trial-size packages, which are to retail at 5 cents per bottle.

Albert E. Currier, Chesterfield Factory, N. H., has issued a new illustrated catalogue and price list of his line of Auger Bits, Augers and Machine Bits. In his introductory circular he refers to the favor with which his goods have been received during the past 50 years, and alludes to their quality.

Whittier Elevator Company, 306 to 310 Eleventh avenue, New York, are putting on the market a line of Spring Mats made of wood and malleable iron, which are intended for doorways, cars, elevators, steamboats, &c. These Mats are described as made of tough elastic wooden slats molded into oval shape, forced into malleable iron cross bars, and finished in oil and coach varnish. The bars alone rest on the floor, allowing the slats to spring, and making the Mat elastic under foot.

The catalogue of the Keene Mfg. Company, Keene, N. H., illustrates their line of Long Reach Self-Adjusting Lever Club Skates. The different styles in which these goods are made are represented, and a Long Reach Lever Speed Skate is also shown. The simplicity and effectiveness of this self-fastening device are alluded to, and points are made in regard to the Skate that the grip on the sole or heel can be tightened or loosened without removing the Skate from the foot; there are no bolts, screws or other parts to lose or become loosened, and that no wrench or key is needed in adjusting the Skate.

W. J. Clark & Co., Salem, Ohio, have issued a pocket edition of their illustrated price list of Sheet Metal and Wood-working specialties. Their Elevator Buckets are prominently represented, the front cover containing an illustration of the old-style leather bucket. A variety of other goods is shown.

American Hardware in the Australasian Colonies.

A recent issue of the *Australasian Ironmonger* has a carefully prepared article on this subject, in which a general view is given of the position of American manufactures in the markets named. It deserves

careful attention from manufacturers, who will find in it suggestions and information which may be of assistance to them in their efforts to occupy or hold these fields. Omitting portions relating to machinery and other manufactures, we give the following extracts concerning Hardware and related lines:

NEW SOUTH WALES.

American Band Saws have long held a very high position here, and the Circular Saws and Vertical Saws from standard makers are making great headway.

Saw Benches, however, for ordinary lumber work, are all preferably of English make, no machine to compare with these being made in the States. The American Circular Breaking-Down Mill, with its traveling frame and adjustable head blocks for bringing up the log to the Saw, although possessing many good points for log work, is not received here with much favor, only a few comparatively being in use, and these, we understand, are principally of Canadian manufacture. The vertical breaking-down frames and also steel frames, with the exception of the few made in the colony, are all of English make, and it is unlikely America will compete in these machines, as in that country the Log Band-Saw Mill is rapidly being substituted for all other machines designed for this purpose. For circular and vertical Saws H. Disston & Sons are well known.

In *Machinery* for operating Tin Plates for preserved meat and fruit purposes, America, we should say, has the bulk of our trade. Doubtless this is due, as is the case of the wood-working machinery, to the extensive use made of the material in that country.

Weighbridges and Scales are largely imported from both countries, and although opinions seem pretty equally divided on the merits of the various machines, we think the English machines still command the readiest sale. A prejudice against the quantity of wood used in the construction of the American machine prevents its more general use, but with what show of reason we are not prepared to say.

Plated Ware.—Various consignments have been received here, but they do not meet with favor. They are too showy in style, not displaying that refined taste that the British manufactures show.

Locks, Keys and Latches of the Yale Company make have greatly come in demand of late years, all our public buildings being furnished with them. To note especially at the General Post Office the private letter boxes are all fitted with the Flat Nickel-Plated Key, which is much less cumbersome than our English-shaped Key.

Lawn Mowers of various makes are taking the place of English, being lighter, easier to handle and less costly.

In *Cheese-Making Machines* the English make are now nowhere. American are all the rage.

Axle Grease and Axle Oil is not being imported so much as formerly, that which is being made from our colonial shale being found equally as good and less costly, and is now largely used by the Public Works Department on our trams and railways.

American Hand Pumps are preferred, those of Douglas & Co.'s make having the largest sale. In Axes no question is raised as to their superiority over English make. Meat-Choppers, small Builders' Castings, Shelf Brackets, Pulleys, Sash Lifts, &c., are gradually gaining ground.

In *Agricultural Machinery* American manufactures need no comment. They are so well known and so largely advertised that we can say nothing further in their favor. The English of late have been taking a leaf out of their book, and combining lightness with strength.

NEW ZEALAND.

Next to Binders, the American implements which have had the largest sale in New Zealand are Corn Drills; of these the M'Sherry was the first introduced, and had the largest sale; next to these, and the one at present having the largest sale, is the Triumph, by Stoddart & Co. The disadvantages of the American Drill were its want of adaptability to the greater variety of grain sown in New Zealand; for instance, the Triumph is the only Drill that will satisfactorily drill peas. The American Drill also erred on the side of lightness, but, being in use at a time of year when time was not so much an object, the question of durability is though more of by farmers, and the colonial-made machine has to a large extent taken the place of the American. A large number of Horse Hay Rakes are yearly sold. The very superior lightness and

cheapness of the American nearly gives them the monopoly of this instrument. For the past three seasons a large number of Cleaning Machines, especially by Johnson & Field, have been on the market, and their low price makes them favored by farmers. They are being sold at less than half the price of the English machine. They are, however, not adapted for grass seed, which is a serious drawback to their use in many districts. In other other districts the large increase in weeds will lead to an extended sale. La Dôw's Disk Harrows had a considerable sale eight years ago, as also had the Corbin, Higganum Mfg. Corporation, but for the last four years the colonial makers, owing to their improvements, especially in transport arrangements, have nearly stopped the sale of the American. The Faurt & Bradley Sulky and Gang Ploughs were introduced, and had a small sale some years ago, and the Deere, Deere Company, was also offered, but the colonial manufactured article is so eminently superior that the remedy of consignments could not have been encouraging. A considerable number, however, of the light, handy and cheap hill-side Ploughs are sold by Otago agents. These come from various makers in the States. In milling machinery American makers have done good business, especially Barnard & Lees. These have supplied warehouse and other-sized cleaners to many of the larger grain merchants and millers. A number of various makes in Smutters, Middlings, Separators, Scalpers and other machines for the economic treatment of flour are annually imported from America for new roller mills being started in various parts of New Zealand. The breaking-down rollers themselves are generally of English or Continental manufacture.

Carriages and Carriage Material.—The strength, variety, and beauty of American timber render it invaluable to the carriage builders in the colony, and they obtain nearly the whole of their woodwork, such as bent Felloes, Naves, Spokes, Rims, Shafts, body parts, and other bend timber, from the States. A few factories bend timber, but nearly the whole of this is of American growth. Common Nut Axles and half patent come from America; other patent varieties from England. Leather for trimming and hoods is also American; the greater part also of the malleable cast and drop forged iron fittings are from the same quarter. American Coach Bolts are generally used, but an increasing number of Nettlefold's Coach and Tire Bolts are finding their way into the hands of users. Nearly all of the light harness used is of American manufacture. Hill at one time sent a large quantity to this market, but of late years cheaper qualities have had the sales. A few years ago Hooker, New Haven, and Graft, New York, sent consignments of Buggies to this market, but the result was not such as to encourage a repetition. Abbott used to be in demand when a really first-class buggy was required; for some years, however, our leading colonial makers have been turning out work quite as good and 20 per cent. cheaper than Abbott Buggies can be landed. The Jackson Wagon Company also tried a consignment of their Farm Wagons here some years ago, but they did not take.

Arrangement of Stores.

The method of accommodating Wire Cloth which is illustrated in Figs 277 and 278 is thus described by the Griffith

Fig. 277.—Wire-Cloth Rack.

Hardware Company, Rushville, Ill., to whom we are indebted for the matter relating to this unique and ingenious method, the convenience of which will be appreciated by the trade.

It consists of a row of boxes 6 inches square, made of $\frac{1}{4}$ -inch stuff, with double

ends. The inside piece of each end is made of 1-inch stuff and the outside of $\frac{1}{4}$ -inch, each box being 4 inches longer than the width of the Wire Cloth. The top and bottom are left open. These boxes stand on end on the rear side of the Nail counter, and are hinged at the bottom so as to drop across the counter when in use, as shown in Fig. 277. A $\frac{1}{4}$ -inch rod

Fig. 278.—Detail of Box for Wire Cloth.

is put through the blocks usually found inside the roll, and each end rests in a slot cut in the inside piece of the end, 2 inches from the top edge when lying down on the counter, as shown in Fig. 278. The block sawed out is replaced in the slot and fastened with a turn button. To keep the block from slipping down on the roll when upright a 3-inch circular tin is nailed on the end of the block. A price card is kept on each box, giving cost and selling price per square and lineal foot, so that no figuring is necessary. Besides the more obvious advantages possessed by this method, it is to be observed that a convenient straight edge to cut by is furnished by the edge of the box.

That a great deal of ingenuity and skill have been expended upon racks for Steel Goods has been made evident by the many of which we have given descriptions in

Fig. 279.—Steel Goods Rack.

this series of articles. From the variety thus presented it would seem that a Hardwareman ought to be able to find something which would answer his requirements. We have the pleasure, however, of adding to the assortment one which is in general design quite different from the prevailing type. It is illustrated in the accompanying cut, Fig. 279. We are indebted for information concerning it to Ford, Weakley & Johnston, Decatur, Ill., who describe it as follows:

The main frame is made of 1 x 4 inch lumber dressed on both sides. It is about 7 feet high, 1 foot wide at top and about 2 feet 8 inches wide at bottom. It can be made of any length desired. The cleats or cross pieces are $1\frac{1}{2}$ x $\frac{1}{2}$ inch, and extend over on either side of the rack about 7

inches. They are attached with screws and placed at least $1\frac{1}{4}$ inches apart, so as to allow the Hoes to be put in or taken out easily. Each set or pair of cross pieces should be sufficiently wide apart to prevent the Hoes being tangled with others in adjoining spaces, and there should be at least three tiers of cross pieces, so as to keep the handles perfectly straight. The Hoes when placed on the rack rest each blade above the other and each space will hold at least half a dozen Shank Hoes, so that the rack will obviously accommodate a large number of Tools. The open spaces in the center afford an excellent place in which to store Hay Fork, Hoe and Shovel Handles. By driving stout Nails at the top of the rack a good place is provided for hanging Trace Chains. The rack can also be used for Garden Rakes and Long-Handled Shovels. By putting in extra cross pieces on the middle tier an excellent D-Handle Spade and Shovel rack is provided. There should be small hooks on each end of the cross pieces to prevent the handles from slipping off. One end of the frame should be fastened to a wall or column to make it steady. The rack we have is 10 feet long, and will hold no less than 15 dozen medium Hoes

Exports.

From recent manifests we make the following abstract showing the exports in Hardware and related lines, which will be interesting as indicating the lines that are going to the markets referred to:

PER SHIP PARAMITA, SEPTEMBER 21, 1888, FOR MELBOURNE, AUSTRALIA.

By R. W. Forbes & Co.—7 cases Sporting Goods, 45 dozen Axes, 9 packages Plated-Ware, $5\frac{1}{2}$ dozen Wringers, 6 packages Choppers, 3300 Cartridges, 1 case Tricycles, 1 case Sporting Goods, 9 cases Hardware, 3 packages Hardware, 4 dozen Glue, 2 packages Hardware, 5 dozen Drills, 2 packages Hardware, 12 dozen Hammer Handles, 22 dozen Hatchets, 18 packages Hardware, 4 dozen Cow Bells, 35 dozen Axes, 90 dozen Shovels, 15,000 Cartridges, 19 packages Hardware, 100 dozen Axle Grease, 20 packages Hardware, 118 packages Carriage Woodwork.

By McLean Bros. & Rigg.—2 dozen Bush Hooks, 1 dozen Wringers, $5\frac{1}{2}$ dozen Pistols and Cartridges, 36 dozen Glue, 2 dozen Lamps, 12 dozen Fixtures, 6 dozen Fly Traps, 2 dozen Planes, 1 dozen Bench Screws, 12 dozen Axle Grease, 1 dozen Meat Choppers, 4 dozen Vises, 45 dozen Brooms, 17 dozen Saws, $\frac{1}{4}$ dozen Lawn Sprinklers, 20 kegs Nails, 1 case Butts, 19 dozen Granite-Ware, 3 Churns, 25 dozen Brackets, 28 dozen Braces, 29 dozen Vises, 30 dozen Brackets, $7\frac{1}{2}$ dozen Pumps, 32 dozen Granite-Ware, 5 dozen Lamps, &c., 1 dozen Dies, $9\frac{1}{4}$ dozen Planes, 16 dozen Gate Latches, $\frac{1}{4}$ dozen Meat Cutters.

By A. Field & Co.—20,000 Tire Bolts, 12 sets Axes, 2 dozen Carriage Furnishings, 4 dozen Sockets, 3 gross Whip Lashes, 11 dozen Harness Tools, 20 dozen Harness Ware, 3 packages Harness Ware, 9 dozen Axle Grease, $1\frac{1}{4}$ gross Harness Dressing, 9 dozen Axle Grease, 9 dozen Whips, 120 dozen Whip Handles, 5 gross Snaps, 1 case Hames, 1 box Hames, 18 Wringers, 35 dozen Harness Trimmings, 2 Creasing Machines, 1 case Harness Wheels, 3 dozen Curry Combs, 33 dozen Locks, 30 gross Pencils, 12 gross Wall Hooks, 5 dozen Hatchets, 5 dozen Spoke Shaves, 51 dozen Hooks, 1 dozen Wringers, 4 dozen Shovels, 2 dozen Locks, 10 dozen Saws.

By Tower Mfg. Company.—80 cases Slates, 5 cases Chalk, 2 cases Curry Combs, 1 case Brackets and Thermometers, 1 case Brackets, 1 case Side Brackets, 1 case Coat Racks, 2 cases Brackets, 1 case Toy Guns, 1 case Brackets.

By Mailler & Quereau.—167,000 Roofing Slates, 1750 pounds Handles, 810 pounds Handles, 40 pounds Axes, 15 cases Saws, 2 cases Vises.

By Morris, Strouse & Co.—4 gross Fly Traps, 2 dozen Money Drawers, 6 gross Fruit Jars, 6 gross Shade Rollers, $1\frac{1}{4}$ dozen Clothes Wringers, 17 dozen Hatchets, 220 gross Safety Pins, 36 dozen Whip Stocks, 24 dozen Hatchets, $1\frac{1}{4}$ dozen Clothes Wringers, 15 dozen Roller Skates, 3 gross Whisk Brooms, 132 pounds Washita Stone.

By Coombs, Crosby & Eddy.—8 dozen Hardware, 1 gross Shade Rollers, 7 dozen Shovels, 2240 pounds Bolts, 50 boxes Clothes Pins, 1 case Emery Cloth, 8 dozen Numbering Machines, 1272 dozen Nails, 24 dozen Traps, 12 dozen Wrenches.

By Arkell & Douglas.—150 dozen Brooms, 80 dozen Axes, 180 dozen Handles, 25 dozen Axes, 1-6 dozen Forges, 6 dozen Shovel Brackets, $9\frac{1}{4}$ dozen Tools, 182 Glass Jars.

By H. W. Peabody & Co.—1 case Hardware.

By W. H. Crossman & Co.—3 dozen Tills, 3 cases Lamp Goods.

By Hsley, Doubleday & Co.—3920 pounds Axle Grease, 672 pounds Axle Grease, 3 Gross Glue.

By Crane & McMahon.—30 cases Carriage-Ware, 24 bundles Carriage-Ware, 9 cases Spokes.

By Singer Mfg. Company.—609 cases Sewing Machines and Parts.

By Healy & Earl.—1 Horse-Power, 65 crates Stoves, 11 Reels, 2 boxes Bolt Cloth, 26 cases Woodworking Machinery.

By Ansonia Clock Company.—55 boxes Clocks.

By S. C. Levin & Co.—63,000 pieces Slates.

By McCoy & Sanders.—9 cases Hardware.

By Meriden Britannia Company.—4 boxes Plated-Ware.

By New Haven Clock Company.—1 case Clocks.

By White Sewing Machine Company.—28 cases Sewing Machines.

By H. P. Johnson.—2000 pounds Folding Chain.

PER BARK RUTH, SEPTEMBER 22, 1888, FOR PORT ELIZABETH, AUSTRALIA.

By New Home Sewing Machine Company.—38 crates Sewing Machines, 13 boxes Sewing Machines.

By Coombs, Crosby & Eddy.—1 dozen Irons, 32 dozen Handles, 15 dozen Axes, 30 dozen Brooms, 200 Plows, 35 dozen Tinware, 10,000 Nails, 184 Plows, 6100 pounds Nails, 4 dozen Plows, 10 cases Plow Parts, 3 Organs, 6 Washing Machines.

PER BARK JAMES G. BAIN, SEPTEMBER 24, 1888, FOR BRISBANE, AUSTRALIA.

By R. W. Cameron & Co.—11 packages Hardware, 20 Axes, 300 dozen Grease, 2 dozen Braces, 9 dozen Hardware, 2 dozen Wire Goods, 3 dozen Egg Beaters, 17 dozen Blocks, 12 dozen Hammers, 36 dozen Handles, 40 dozen Hoe Handles, 3 dozen Sad Irons, 4 gross Shade Rollers, 9 Scales, 12 Stoves, 6 dozen Saws, 1 dozen Plumbs, 30 dozen Shovels, 50 cases Clothes Pins, $3\frac{1}{4}$ dozen Churns, 15 dozen Axes, 80 dozen Axes, 10 dozen Picks, 10 Stoves, 6 dozen Axes, 2 dozen Hatchets, 4 dozen Picks, 1 dozen Bush Hooks, 1 dozen Adzes, $\frac{1}{4}$ dozen Mattocks, 20 dozen Shovels, 7 dozen Hammers, 84 dozen Chimneys, 1 box Tacks, 3 Guns, 6 Stoves, $\frac{1}{4}$ dozen Barrows, 1 package Washboards, 500 Broom Handles, 1 dozen Saws, 68 dozen Handles, 11 dozen Pumps, 7 dozen Hoes, 2 dozen Corn Shellers, 1 dozen Sluice Forks, 1 dozen Hay Forks, 10 packages Hardware, 7 Scales, $1\frac{1}{4}$ dozen Scythes, 1 box Plated Ware, 1 dozen Braces, 12 Lamps, 1 dozen Blocks, 10 dozen Hoe Handles, 2206 pounds Barb Wire, 100 pounds Staples, 1 dozen Snaths, 12 dozen Axes, 10 dozen Picks, 30 dozen Shovels, 16 dozen Saws, 24 dozen Stoves, 12 dozen Lamps, 42 dozen Hoes, 6 Lawn Mowers, 8 Corn Shellers, 8 Wood Hoppers, $1\frac{1}{4}$ dozen Grindstones, 42 sets Axes, 29 packages Carriage Material, 32 dozen Hatchets, 12 Hammers, 1 gross Shade Rollers, 15 dozen Tacks, 1 dozen Wheelbarrows, 6 dozen Washboards, 50 gross Clothes Pins, 3 Guns, 82 dozen Handles.

By Healy & Earl.—3 boxes Emery Wheels, 3 boxes Emery Machinery.

By F. B. Wheeler & Co.—16 dozen Brushes, 1 case Carts, 2 cases Clocks, 12 cases Hardware, 2 cases Forges.

By Strong & Trowbridge.—1 case Hardware, 1 case Chisels, 1 case Hammers, 3 cases Saws.

By Winchester Repeating Arms Company.—10 cases Cartridges.

By Coombs, Crosby & Eddy.—84 gross Hardware, 33 gross Axle Clips, 10 dozen Stove Parts.

By V. Basanta.—40 dozen Axes, 46 dozen Lamp Goods, 54 dozen Handles, 80 dozen Hatchets, 100 dozen Axes, 18 dozen Hoes, 19 dozen Files and Saws, $1\frac{1}{4}$ dozen Velocipedes, 200 dozen Slates, 6 dozen Hammers, 12 dozen Razor Strops, 20 Shovels, 15 dozen Wrenches, 30 dozen Hammers, 6 dozen Snaths, 1000 Broom Handles, 12 gross Clothes-Pins, 5 dozen Rolling Pins, 25 dozen Chain Seats, 24 Stoves, 3 gross Axle Grease, 2 gross Hide Whips, 1 dozen Perambulators, 21 dozen Traps, $\frac{1}{2}$ dozen Scales, 7 dozen Lamp Goods, 75 dozen Lamp Chimneys, 50 Washboards, 1 dozen sets Sad Irons, 35 dozen Electro-Plated Ware, 3 dozen Electro-Plated Ware, 26 dozen Lampware, 20 dozen Lamp Goods.

By Collins Company.—200 dozen Edge Tools, 198 dozen Edge Tools.

By H. W. Peabody & Co.—35 packages Hardware, 1 case Lampware, 3 packages Lampware, 10 packages Pumps, 5 cases Hardware, 1 case Fire Arms, 8 cases Hardware.

By R. W. Forbes & Son.—1 box Plated Ware, 1329 pounds Carriage Bolts, 24 sets Wheels, 2 cases Carriage Hardware, 4 packages Carriage Hardware, 16 packages Agricultural Implements.

PER BARK HERBERT BLACK, SEPTEMBER 25, 1888, FOR BRISBANE, AUSTRALIA.

By C. S. Lascelles & Co.—165 packages Washboards, 200 boxes Clothes Pins, 6 crates Stoves.

By Welsh & Lea.—5 cases Iron Bolts.

By Millers Falls Company.—12 boxes Boring Machines, 7 boxes Scroll Saws, 1 box Vises, 14 Breast Drills, 23 dozen Hack Saws, 22 boxes Hardware.

By Arkell & Douglas.—44,800 pounds Wire, 20 dozen Shovels, 50 dozen Handles, 40 dozen Washboards, $2\frac{1}{4}$ gross Axle Grease, 25 dozen Axes, 200 dozen Handles, 40 dozen Hatchets, 100 dozen Shovels, 20 gross Blacking, 15 dozen Axes, 30 dozen Axes, 25 dozen Axes, 12 dozen Blocks, 40 dozen Hatchets, 75 dozen Axes, 12 dozen Axes, 10 cases Slates, 2 1-6 dozen Pumps, 245 pounds Hardware, 4 dozen Picks, 8 dozen Hatchets, 25 dozen Axes, 24 dozen Lampware, $1\frac{1}{4}$ gross Axle Grease, 6 dozen Whips, $\frac{1}{4}$ dozen Boring Machines, 700 boxes Clothes Pins, 128 dozen Handles, 1 case Wicks, 12 dozen Forks, 6 dozen Braces, 48 dozen Clips, 12 dozen Washboards, 96 dozen Handles, $\frac{1}{4}$ dozen Lawn Mowers, 12 dozen Hammers, 24 dozen Rakes, 1 dozen Churns, 360 pounds Oil Stoves, 24 dozen Hose, $2\frac{1}{4}$ dozen Chimneys, 8 Guns, 10 dozen Plated-ware, 20 dozen Hatchets, 16 dozen Picks, 5 dozen Axes, 1 case Adzes, 60 dozen Axes, 10 dozen Spades, 180 dozen Shovels, 1 dozen Hay Knives, 33 packages Axle Grease, 500 Cartridges, 24 dozen Saws, 50 dozen Axes, 51 dozen Hatchets, 18 dozen Picks, 3 dozen Pails, 1 dozen Shellers, 6 dozen Axes, 212 dozen Lamp Goods, 10 dozen Snaths, 800 pounds Castings, 1199 pounds Nails, 3 dozen Wrenches.

The Art of Buying Goods.

BY KNARF.

There are so many things contingent upon buying goods for profit that it is hard to know which to give the most prominence to—in fact, no one thing can stand out pre-eminent, as a combination of characteristics are necessary to success in this branch of business. It has been said of the fine arts, of painting, of sculpture, of music, and may be said of any vocation or business, if money-getting is the only, or prominent, object in view, the result will be failure. The love of the occupation will generally carry success with it, as the work will usually be thoroughly done, faithfully done, and done as well as the person knows how, which continued practice will lead to perfection. A man with a thorough education has, already, the advantage of an illiterate competitor, as knowledge is power; and an education, especially if coupled with observation, gives that fund of general knowledge which is indispensable in business life.

We will confine ourselves to retail buying in the Hardware, Iron and Stove trade. The taste and judgment exercised in quality and price needful in the dry goods buyer does not enter largely into our needs. The horror expressed by persons in other lines of business at our "discounts" is amusing, as they have a dread of much figuring. This same mental exertion gives us men of minds, minds as thoroughly disciplined as that of a college graduate, if our buyer is conversant with Hardware business in its various departments.

The ease with which buying is done at the present time contrasts forcibly with the time and labor necessary to buy a six months' supply of goods of 40 years ago. The merchant found his way to Chicago then as best he could from his home. From there by lake, canal and stage to Albany and by the river from there to New York. Now the retailer has quite an extensive library of large, handsomely bound catalogues from the manufacturers and jobbers, with almost every article illustrated,

and, in most cases, a universal price list on each class of goods of corresponding grade and class. Comparative lists of Locks aid in selecting the same style of some other make, and telegraph cipher condenses a large order into the ten-word limit. The facilities for buying goods have kept pace with the numerous other improvements in doing business.

The old adage that "Goods well bought were half sold" still holds good, not only in price, but also in quality, quantity and desirability for your local trade. The drummer may be looked upon as a necessary evil, or a blessing, according to the man; but the merchant and the drummer are of mutual benefit to each other, and every traveling man should be entitled to a courteous reception and subsequent considerate treatment, until he makes himself so obnoxious you can't stand it any longer, then fire him. For change in prices, new goods and a hundred and one other points of information, we are dependent upon him. So treat him nicely. A thorough perusal of all price currents, advertising leaflets, and such matter as may come through the mail to you, is well worth the time spent. If nothing shows itself of immediate advantage to you, there are points to make memorandum of, and cuts you will need some time, that should be transferred to an indexed scrap-book. The next man who comes in may want just what you saw on a circular, and now the boy is using that circular to clean a lamp chimney with. A short time spent in conversation with each salesman will generally give you enough new information regarding his line of goods to pay for the time spent. Let it be understood, when you say you do not want any goods this trip, you mean it. This knowing your wants will save you much annoyance by men hanging around the store, expecting to urge or worry you into buying a bill. It always reminds me of caged lions to see a drummer follow the merchant back and forth, up and down the store, one on either side the counter, trying to sell him goods, which the undecided answer of the merchant gives him hopes of doing. Always have a "want book," and when out of anything or nearly out, see it gets set down as a memorandum to buy by. Toiling through a 1000 or 1200 page catalogue with each traveler, and being asked at each page, "Do you want this?" is not what it is cracked up to be; it is time wasting and temper trying. After a want book, the next most important thing is some convenient and accurate plan of keeping prices. There are more than enough things to remember, without burdening your mind with things that can be committed to paper. Discounts on Bolts, Screws, &c.; staple goods can be remembered, as you are buying frequently, but the great mass of prices, many of them net, is too much rubbish to burden the mind with; and in most cases you are not sure enough of their being correct to say you are right, and be wrong in the price. Some houses instruct their traveling men to make low prices on Staples, and to more than make up the loss of profits on Shelf Goods or Fancy Hardware. You want to be posted for these fellows. A copy of the order should always be retained. Some people have a way of "stuffing" orders, or the house may consider prices on some articles too low, billing those goods higher than the agreed price. A salesman's name attached to an order is the surest way of getting the required rebate. Goods may arrive before the invoice does, and may be checked off from the copy of order, saving time, getting the goods out of the way of light fingered people, or enabling the price to be set on some article a customer wants at once. Always be in a position to know the correct buying and selling price of each article.

It is safe to presume that the quantity of any class of goods may be increased a little over the previous year's purchase, to accommodate an increasing trade in season goods. There may be failure in crops, financial disturbance at large, or some unlooked-for reason why trade in general is not good; in such a case misery has company in your competitors. A good assortment of any line is better than all of a kind. The ready excuse of those purchasers who give their own town the go-by and buy goods in some larger town or city is, "We had a better assortment to choose from." When you get an assortment that satisfies your trade, keep it up; don't run out of goods. The article that you are tired of seeing on your shelf, and that you have been trying to get rid of for six months or a year, is no sooner sold and you congratulate yourself that it is gone, than the next customer wants the same thing. If you are carrying any particular line of goods and people know that you make a specialty of them, keep it well up, even if you make a special order for it.

When ordering one article for a customer it is often well to order an extra one for stock; some retailers make it a rule to always do this, and generally to their profit. While a new thing brings a good price while new, it is well to be conservative in the practice of being the first to introduce new goods; it is safer to wait until a demand has been created for them. Adjustable Pot Covers, for instance, probably had the largest sale of any article recently put on the market, because buyers thought them saleable and that there would be a demand for them; I know of nothing that you will find on hand so near the original amount purchased as these same Adjustable Pot Covers.

Your store could soon be filled up with goods having no better selling qualities because they don't take. Wait for the demand. When a house retails from \$15,000 to \$20,000 worth of goods a year there comes the feeling that goods must be bought from manufacturers instead of jobbers. The manufacturer gladly quotes prices, but to secure 5 per cent. to 10 per cent advantage in cost a certain quantity must be taken, which is much in excess of your former purchases in any one line. You overload yourself, while your competitor with less means buys less and has his nimble sixpence ready to invest again, while your capital is locked up in goods you are carrying over. A large number of the yearly failures may be traced to buying in too large quantities. With the facilities for getting goods in a short time little excuse exists for imposing on yourself. Under these existing circumstances it is injudicious to buy for future delivery to satisfy the traveling man, "so the house may know he has called on you," unless it is season goods that are ordered. When season goods are presented by the salesman, even though it be six months ahead, then is the time to talk about them. He has prices, styles and information at his tongue's end then. If not bought then you may not think of them again until the time for showing them arrives, and traveling men, supposing you have bought, will not think of offering them later. By this time stocks in jobbers' hands will be broken, and some early bird can't wait until you order for him, and there you are.

The class of goods bought, the quality, depends upon your trade. The style will depend upon your location in the country. A Michigan pattern Axe would be dead stock in Missouri, and the same style in handle and blade of a Pocket-Knife would not suit a Northern and Southern man. In buying a line of goods it is usually safe to buy one article that is high priced. You can probably get cost for it; it makes a show and makes talk, which is good ad-

vertising, besides giving a good assortment. With some customers nothing on earth is too good for them, until they hear the price, when you can make a sale of one of the cheaper ones. Some are always crying low prices, and, as contradictory as the statement may seem, low prices are not desirable. More money is made when goods are high than when they are low. If certain per cents are added to goods that you sell \$20,000 of during one year, and the cost of the same class and quantity of goods is less the succeeding year, the net profits will be less, if figured at the same per cents to arrive at the selling price. A larger quantity of goods will also have to be sold to make the sales reach \$20,000. So a low price on goods is not desirable. Sometimes goods may be presented in such a way that you will find it desirable to purchase after you have positively declined doing so. If it will be to your advantage do not be too proud to change your mind. Even if you are full of a line of goods, inquire the price, as there may be an advance you want to take advantage of in selling, or there may be a decline in price you will want to meet, and not have your stock left on your shelves by your competitors selling them lower. You may think at the time he is a fool and is losing on this line when he is in reality making a good profit at the decline in cost.

The Union Indurated Fibre Company, of New York, have recently shipped some 50,000 feet of their pipe to the Bell Telephone Company, of Philadelphia. This is now being laid in Market street, and so much to the satisfaction of the telephone company that we understood that they were ready to place an order for some 200,000 feet more which the fibre company were obliged to decline on account of their inability to deliver rapidly enough. The pipe is pressed out from wood fiber, and treated so as to render it impervious. Its advantages for underground work are obvious. The company have recently received a letter from General Greely of the Signal Service, relative to the merits of fiberite battery jars furnished the department. These jars are reported upon by Lieut. Frank Greene, of the Signal Corps, in charge of the telegraph division. Lieutenant Greene considers that these fiberite battery jars will make an excellent substitute for the glass ones which have been in use, as they will always retain their shape, are much easier to keep clean and renew, and are not liable to breakage from freezing or violence in transit.

According to the Roanoke, Va., *Evening Telegram*, the pay-roll for the month of August at the Roanoke Machine Works amounted to over \$50,000. The roll shows that 1120 men were employed at the time, and the force is constantly being increased. The immense extent and capacity of these works can be judged from these figures. Less than six years ago Roanoke itself had barely 400 inhabitants.

The Chicago Forge and Bolt Company, Chicago, are making a new car of iron and steel for brickmakers' use, which possesses features of value. The journals consist of friction rollers, enabling a very heavy load of bricks to be pushed with ease by hand. The body of the car is made of a channel bar bent to form a square frame, to which the wheel seats are bolted. The car is loaded with green brick and pushed into the kiln, remaining without injury until its load is sufficiently burned, thus economizing labor in handling the brick. The rollers on which the car axles revolve were the chief difficulty in constructing these cars, and exhaustive experiments were made in perfecting them, to secure a pattern which would work satisfactorily after exposure to the intense heat of a kiln.

The Empire Fruit Knife and Nut Pick.

The Empire Knife Company, West Winsted, Conn., are putting on the market the novelty named above and represented in the illustration herewith given, which, however, fails to represent the attractiveness of the handle, which in the sample we have seen is a floral design in oxidized and bright plate. The illustration represents the article full size. The

The Empire Fruit Knife and Nut Pick.

fruit blade and the nut pick are of one piece, the one shutting into the handle while the other is in service and *vice versa*, thus making a most convenient and dainty knife and pick. The advantage of having the fruit knife and nut pick together and not in separate pieces is alluded to by the manufacturers, as well as its convenience for home use for the parlor and for daily service. It is guaranteed 12-ounce silver plated. Each knife and pick is put up in a plush case, which is inclosed in a card box.

The Adams Oil Can.

The Adams & Westlake Company, of Chicago, are putting on the market a new can for holding oil and gasoline which they have named the Adams. The accompanying cut is an excellent representation of it. It is made of IXX steel plate. It has a wooden bottom and a retinned wrought-iron spout, and is not easily bruised or dented. It is fitted with a pump for the easy extraction of the con-

tents, and the top of the can is sunk to catch a possible overflow. The spout adjusts itself to the height of a lamp or other receptacle placed under it to be filled. The slot for filling is air-tight, so that no loss by evaporation will occur. The can is ornamented by the company's oxidizing process and is furnished in assorted colors, forming a pleasing contrast with the silver finish of the tin plate. Two sizes are made,

one holding 8 gallons and one 5 gallons. They are packed for shipping in racks of a half dozen.

A Basement Refrigerator.

A correspondent in Boston writes to us as follows: "Some years ago the writer was asked for a plan of a cooling room to be made in the basement or cellar, under a grocery store. The proprietor of the store was a large buyer of butter and other

products from the farmers, and the ordinary ice box in the store was found to be too small, and there was no room for a larger one, so it was resolved to build a refrigerator in the basement. The inclosed drawing is intended to explain the general features of construction, and while there may be nothing novel or original about the affair, it may offer some useful hints to some of the readers of *The Iron Age*. The mat-

with sliding doors at top and bottom so a current of cold air could be produced from the ice. When ice is kept on top of the storeroom, it is difficult to prevent the condensed moisture from dripping into the articles below, without interfering with some of the numerous patents now in force, as the writer knows from experience. The bottom and sides of ice-room should be covered with metal so as to catch the water, a pipe with trap being provided to take it away. Any suitable grating can be made to prevent the ice from injuring the metal bottom."

The Supply of Natural Gas.—There is no failure in the supply of natural gas. This is the point made by the *Pittsburgh Times*, by whom many facts are cited in support of the position. The editor concedes that great gushers are diminishing in districts where additional wells are drilled, but new developments more than offset the loss in these special instances. Natural gas operators, we are told, all admit that the gas is failing in some fields in the sense that the first wells in a territory had a greater pressure when struck than they have now. A number admit that the great volume of gas taken from such fields as Murrysburg has lessened the flow, and are not surprised. But they hold that the new territory being developed will produce more than the equivalent of the failure in the first fields. Numbers of great gushers, such as those at Bellevue, have not yet been brought into use. Natural gas experts agree that the present generation need not worry over the fuel

A Basement Refrigerator.

ter of size and material would depend upon circumstances; for example, where sawdust is plenty that material could be used to fill the exterior double walls. If this material is not at hand, a liberal use of building paper or asbestos sheathing would secure the desired result of making the walls as near non-conductors of heat as possible. The door to the cold storeroom and to the ice-room can be placed where most convenient, and should be made double, like the walls. It might be a good plan to have a trap door in the floor above, then the cakes of ice could be lowered by means of a rope. If the inner walls of the cold room are covered with zinc or galvanized iron, and a ventilating pipe is put in at the bottom, butter and such articles could be kept very nicely. Since butter absorbs odors very rapidly, great care has to be taken in the manufacture and use of refrigerators on this account. It is not pleasant to have butter taste like a pine board, as it might if kept in a box lined with pine. The metal partition between the ice and storeroom might be provided

supply, as none will live to see the natural gas supply give out. But, they argue, if it should fail, fuel gas can be furnished under patents of Pittsburghers at a mere trifle more than the cost of natural gas. This being the case, and Pittsburgh's fuel gas system is a tried certainty, the bugaboo of fuel failure in Gasdom held up by envious Eastern cities, is of no consequence.

The Corinth Canal.—One of the oldest engineering projects in the world is now gradually approaching completion, and the work will probably be finished during the coming year. This is the canal through the Isthmus of Corinth, in Greece, which was first planned some 25 centuries ago, and on which work was actually begun under the Emperor Nero, so that over 1700 years will have passed between its beginning and its final completion. As finally excavated the canal will be 4 miles long, with a depth of 8 m., or sufficient for the largest vessels which usually navigate the adjacent seas. The total cost

of the canal will be about \$9,000,000, or \$4,000,000 more than the original estimate.

Star Steel Fence Posts.

Oliver Bros. & Phillips, Pittsburgh, Pa., are manufacturing a line of steel fence posts, which they designate as the Star. They are illustrated in the accompanying

Fig. 1.—Star Steel Fence Post.

cuts, Fig. 1 showing a portion of a post, indicating the manner of its construction and the way in which the wire is attached, while Fig. 2 gives a sectional view, full size. The low price at which these goods are furnished, the fact that no staples are

Fig. 2.—Sectional View of Fence Post.

required, and the ease with which the fence is constructed, are points made in their favor. It is suggested by the manufacturers that wooden posts be used every 100 feet, steel posts in between, making a

Fig. 3.—Star Picket and Tent Pins.

light, handsome fence. Fig. 3 shows the Star picket and tent pins, which are formed, it will be observed, on the same principle.

In all the prairie regions where timber is scarce, there is always trouble keeping in a supply of fire-wood for starting the fires of locomotives. They manage that business at the Wabash Western shops, at Moberly, Mo., in a way that is worthy of

imitation by other roads. All the worn out ties along the line of the road are brought here, cut up by contract for 50 cents a cord, and the wood is said to be as good for firing up as ordinary fire-wood that costs \$3 or \$4 a cord.

Thomas' Automatic Police Nippers.

This article, which is put on the market by Tower & Lyon, 95 Chambers street, New York, is represented in the illustra-

Thomas' Automatic Police Nippers.

tion, which in a general way indicates its special features. When the nippers are closed a slight pressure on the projecting button, seen under the handle, opens the nippers, at the same time forcing the projecting piece outward, as shown in the cut, which represents the implement partially open. In putting the nippers on the wrist the projecting piece comes in contact with the wrist, thereby automatically closing it, and at the same time locking it, it being only released by pressing on the button as above. It is thus referred to as automatic, self-closing and self-locking. It is well-made and finished in nickel plate.

Senator Sherman on Commercial Union.

Senator Sherman gives free expression to his views in favor of commercial and political union with Canada. "It is true," he says, "that commercial union tends to increase trade, and yet political union is the only thing that can bring about absolute reciprocity of trade and communion of interests." Again, "If you have exactly the same

duty the prices would be just the same, and nothing would be gained by smuggling. There are more than 1,000,000 native Canadians living in the United States, and citizens of the United States have more than \$100,000,000 of capital invested in Canada. The similarity of the people in language, descent, habits and institutions makes union easy and natural. The lines of commerce from Canada to this country are lines of longitude and not of

latitude. The coal of Nova Scotia is shipped to New England and the anthracite of British Columbia is needed in California. Ohio sends her coal to Ontario cheaper than Nova Scotia or British Columbia can. The iron, copper, nickel, silver and lumber of Canada north of the lakes are more easily transported to populous regions like Chicago and Buffalo than in any other direction. They will not bear transportation to England, as the cost is too great. Canada wants our markets and the United States wants her natural resources. All the products of Manitoba and the Northwestern Territory naturally follow the valley into Minnesota and Dakota. It is a fight with nature to carry those products east or west over the mountains. The maritime provinces of Canada have their natural outlet and market in New England, which can furnish them capital and enterprise. The United States will find in these provinces what the United States needs, a real nursery for seamen. The provinces will fall heir to all the fisheries of New England without dispute or contention. I know of no province or section but would gain largely by union without losing any local advantage it now possesses."

Arctic Ice Dogs.

The accompanying illustrations represent the special features of the line of ice dogs or creepers which are patented and put on the market by George A. Waller, Seneca Falls, N. Y. It will be seen that they consist of a light malleable casting which fits to the sole of the shoe and is fastened to the foot by means of a toe strap and an endless elastic band drawn high over the heel, thus holding the dog to its

Arctic Ice Dogs.

place. It is obvious that thus attached they are easy of adjustment and quickly put on or taken off. Their simplicity and security are alluded to by the manufacturer. They are made in two sizes, for ladies and gentlemen, respectively, and the point is emphasized that the manner in which they are fastened to the foot adapts them equally well for use with boots, shoes or rubbers. They are intended to retail for 50 cents per pair.

It may not be without interest to our readers to know that arrangements are at present being made for the introduction in the United States of the Serpollet capillary steam boiler, briefly described in *The Iron Age* a few weeks ago. One of the boilers is now on exhibition in New York at the establishment of the American Gas Saving Company, 733 Broadway.

There are 21 cotton mills in Japan, the number having more than doubled during the past two years.

CURRENT HARDWARE PRICES.

OCTOBER 10, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers at the figures named.

THE IRON AGE

THURSDAY, OCTOBER 18, 1888.

Fig. 1.—Section through A B, Fig. 2.

Fig. 2.—Front Elevation.

3000-TON SHEAR, HOMESTEAD STEEL WORKS, CARNEGIE, PHIPPS & CO.

A Three-Thousand Ton Shear.

The illustrations which we present herewith, while they show the construction, fail utterly to convey an adequate conception of the dimensions of what is undoubtedly the largest shear in the world. It has been

in successful use for some time past at the Homestead Steel Works of Carnegie, Phipps & Co., at Munhall, near Pittsburgh, Pa. It is rated at 3000 tons, and is a part of the famous slabbing mill. Briefly stated, the shear is operated by the descent of the upper blade, which is ef-

fect by the introduction of water at a pressure of 4000 pounds per square inch, into the cylinder shown in the lower part of our engraving. The plunger is stationary, the cylinder proper being forced downward. This motion is transferred to the casting, which carries the upper blade

by the two 15-inch bolts shown in the drawing. These two bolts, it may be stated, are forgings specially made by Whitworth for this shear. The cylinder, if it may so be called, is a very heavy steel casting, weighing, as it does, 54,600 pounds. It is 13 inches thick on the bottom and 17½ inches thick on the sides, and is 37 inches deep. Its width from center to center of the two 15-inch bolts is 6 feet 6 inches, and its total width 8 feet 11 inches. The cross piece carrying the upper blade was a particularly difficult steel casting to make. It will be observed that it is brought back into place by a special lifting cylinder placed on top of the shear. The small hydraulic cylinder shown back of the blade in Fig. 1, with its long plunger, is the gag to hold down the slab or billet to be sheared when it becomes so short that its weight is not great enough to prevent its tipping while the shear is operating. The shear has a capacity to cut steel 48 inches wide and 24 inches thick. The blades proper are made of crucible steel, double diamond in section. These knives are being used in all the shears at Homestead. The shear was built by the Morgan Engineering Company, of Alliance, Ohio. A study of the dimensions inscribed in our drawings will afford some idea of the magnitude. It is over 15 feet high over all, the top of the frame proper over 11 feet high.

Electric Welding.

In a paper on "Electric Welding," presented at the Scranton meeting of the American Society of Mechanical Engineers, this week, Mr. C. J. H. Woodbury explained that the process enables the welding of any two pieces of the same metal or alloy ranging from the most refractory metals to the alloy which fuses at 162° F. It will join dissimilar metals when the welding point of one is not too far in excess of the fusion point of the other.

These results seem to indicate that the classification of metals into welding and non-welding has been due to imperfections in the ordinary and time-honored methods, rather than any peculiarity in physical constitution warranting such arbitrary classification. The process is far cheaper than that of hand welding, and also extends to other methods of manufacture, but the comparative expense differs according to the previous conditions in every place where it has been applied thus far. Its applications in practical work thus far have been confined to butt-welding for many purposes, such as continuous wire work, carriage work, axles and tires, cotton bale ties, barrel hoops and wire cables and many miscellaneous purposes. Axes are made of drop forgings, joining the tool steel edge to a mild steel poll, bars are heated in the middle and upset, forming collars, and pipes are joined together—a matter of great value in ice machines. The list might be continued to greater length, but this indicates the range of its practical uses at this early day.

The value of the process, for most purposes, independent from any scientific interest or mechanical ingenuity shown in the apparatus, must be that of the resistance of the welds under tensile stress. It will be readily understood, however, that, as this process accomplishes many things hitherto impossible, aside from any question of ultimate strength, it is fitted for applications in many constructions where it saves labor and time; provided only that the joints be in all cases sufficiently good for the purpose for which the article is designed. A large field thus opens up in the execution of ornamental design in metal work, where it will supplant screws, rivets or solder for fastenings, and in other evident applications. We would add that

the machines by which the welding is accomplished were illustrated and described in *The Iron Age* of July 12, 1888.

Hot-Air Heating and Ventilating.

The system of hot-air heating and ventilating by means of a fan in connection with a steam heater, through which the air is forced wherever required, is now being rapidly introduced. In view of the interest attached to it we need offer no apology for again referring to the subject, illustrations of some of the details of the plant having appeared in *The Iron Age* for February 2, 1888. It possesses not only the special advantages of supplying an ample quantity of fresh air, but many others that make it preferable to steam-heating by direct radiation.

In this system a combination is made of the heating and ventilating arrangements, thereby reducing the running expenses which would be incurred by the two running independently. Simply stated, the method of application is as follows: Fresh air from out of doors is conducted to a specially constructed steam-heater, through

to one-fifth the pipe is required that is necessary in the system of direct radiation.

The entire heater is inclosed in a steel-plate jacket, which precludes all possibility of fire. The steam fan immediately joins the heater and is of a type specially designed for ventilating, being able to handle large volumes of air at a very small expenditure of power. Motive power for the fan is derived from a direct-connected upright engine, the exhaust from which is used in the heater. The cost of running the blower is thus reduced to practically nothing, for the heating power of exhaust steam is only about 3 per cent. less than that of live steam. The engine cylinder may, consequently, be considered as simply an enlargement in the steam-pipe on its way to the heater.

Instead of a large number of air-cocks and valves through the building there are in this apparatus only the few valves on the heater and engine to be attended to, and these are but a few feet apart. The entire apparatus occupies but little space, and that where it is generally of little value. Registers in the inlets into the separate rooms serve, at the discretion of their occupants, to preserve the proper

3000-Ton Shear.—Fig. 3.—Section through C D, Fig. 2.

which it is rapidly drawn by means of a fan which discharges from its mouth the air thus heated. By means of a properly arranged system of distributing ducts this air is delivered to the various rooms of the building. The air passages should if possible be built into the walls, but under other circumstances may be constructed of galvanized iron. The position of the outlets may be varied to suit local conditions. In manufacturing establishments where galvanized iron ducts are used, they are usually suspended from the ceiling and extended centrally the entire length of the room, and branches or outlets are taken out at desirable points. In order to save material and to preserve an equality of pressure, the main pipe is usually reduced in diameter proportionally to the branches taken out.

The apparatus in its most approved form is manufactured by B. F. Sturtevant, of Boston. The heater is made up of independent cast-iron sections, into which are screwed wrought-iron pipes which connect at the top and serve as a passage for steam from one end of the section to the other. A circulation of steam is kept up through these pipes and bases, the water of condensation being removed by means of a steam trap. It is claimed that a great reduction in the amount of pipe required to do a given amount of heating is made when the hot-blast steam-heating apparatus is used. The high velocity of the air crossing the pipes causes a very rapid condensation of the steam, and only one-third

atmospheric conditions. The amount of air and its temperature and humidity are directly under control.

In theaters and halls of audience this system finds its most complicated, but, nevertheless, its most satisfactory application. Naturally, in such buildings, where the occupants are very closely seated, the greatest need is felt for perfect ventilation, and no system is successful that is not positive, and none is positive except that dependent upon the propulsion of the air by means of a fan. Commercially speaking, however, as an accessory to different processes of manufacturing, it is the most valuable. In the various methods of drying such materials as lumber, wool, cloth, grain, tobacco, glue, &c., the effort has always been to secure a circulation of the heated air. Certainly nothing can be more reasonable than to make the circulation sure and positive by means of a fan.

A direct telephonic line has now been established between Paris and Marseilles. The charge for five minutes' conversation between the two cities has been fixed at about 60 cents. Conversations between Paris and Lyons will also be practicable by the new line, as well as between Lyons and Marseilles.

Iron ore from Catorce, in Mexico, will be shipped to the United States as soon as a branch of the Mexican National Railroad can be constructed.

English Engineering Supplies.

What is probably the most complete English catalogue that we have yet seen has just been sent us by Messrs. John Birch & Co., engineers and merchants, of Liverpool, England. It relates to railroads and rolling stock, giving the cost of plant and material for portable, light and main lines, and containing also chapters on river steamers and light craft and dredging plant. Those who have become familiar with the ordinary run of English trade catalogues will find the present one a decided departure from the general type, the care which has been given to its preparation putting it, so far as the giving of information is concerned, on a level with many of the elaborate and pretentious American specimens. It is a book measuring $8\frac{1}{2} \times 12$ inches, and embraces 232 pages, and is profusely illustrated, the engravings showing all the different forms of devices and machinery which the firm are prepared to supply to intending purchasers. One of the principal features of the catalogue which will strike the examiner at once is the complete system of code words which has been adopted, and by which not only each article, be it either a railway car or a locomotive has its word for reference and cable, but every probable modification and extra which would be required in connection with it is also coded. We need not, therefore, specially point out that the book would be of great benefit particularly to the buyer or engineer in distant countries, for whom apparently it has been specially designed, and who without such a book would probably be obliged to correspond for many weeks with agents in manufacturing centers. As intimated, the book treats of both portable railways and main line works, the former being taken up first. Then come descriptions of cars and rolling stock generally, followed by particulars and engravings of locomotives, turn-tables, water tanks and columns, dredges, &c. Concluding chapters are given on light railways, steam launches and dredging plants, these latter often being useful in connection with railway systems and contractors' work. A carefully prepared index also is given, which adds very much to convenience in looking up any particular piece of machinery. A number of blank sheets make up the final portion of the catalogue, and are intended for the convenience of inserting supplementary pages which may be issued from time to time.

A New Torpedo.—For some time past experiments with a new form of torpedo have been conducted at College Point, L. I., by the Naval Board of Ordnance. The torpedo is the work of Messrs. George A. Haight and William H. Wood, and is of the well-known cigar design. It is propelled by carbonic acid gas and is controlled by electricity. It is about 40 feet long and 24 inches in diameter, and is supported under water by a second cigar-shaped float of somewhat greater length. Tests which were recently made with the Navy Yard tug Nina seem to have given very satisfactory results. The Nina was used as a target, being anchored behind a torpedo net about $\frac{1}{4}$ mile from the point of discharge. For the trial the netting was not of very strong make, and the explosive charge consisted of only a small can of powder. The distance was traversed in a little less than three minutes, the torpedo cutting clean through the netting, showing that under practical working conditions it would have brought about disastrous results to the target.

It is of some interest to note that the French Minister of War has published his *Instructions sur l'armement de l'infanterie*

an illustrated description of the much-talked-of Lebel rifle, of which 350,000 are now being issued to the French army. The construction of the rifle has for some time been a jealously guarded secret, and the publication accordingly is denounced by many French journals as a serious mistake.

The Rapid City School of Mines.

A representative of *The Iron Age* had occasion lately to visit the School of Mines, at Rapid City, Dak., and was much surprised to find such a noble beginning made for a technical school in that distant locality. There are two buildings, both built of brick, located far enough apart to make wings for a main building which is intended to be located between them, according to the original design. One building contains the Dean's office, a well-equipped laboratory and a furnace-room on the ground floor, a large lecture-room and classrooms on the second floor, and a very large cabinet of mineralogical specimens on the third floor. The other building is not completely finished, needing a little more work on some of the rooms, but it contains several rooms to be used for laboratories, and one large room on the ground floor which is now supplied with a complete plant for milling and concentrating ores. A 40 horse-power steam engine furnishes the power to crushers, stamps, cornish rolls, jigs, vanners, &c. Mill runs are made of gold, silver and tin ores, &c., which are brought here to be tested from various parts of the Black Hills. The school having been erected by the Territory of Dakota, and, being supported from the public funds, its facilities are open to the public, who are asked merely to pay the cost of the tests which they wish to have made. All experiments in the use of machinery or in milling and concentrating ores of diverse characteristics are open to all who choose to apply for the results. A furnace for smelting tin concentrates has been partly completed and will be finished as soon as next year's appropriation becomes available. F. R. Carpenter is Dean of the school, and among the faculty is Prof. H. O. Hofman, late of the Institute of Technology, Boston. This institution is hardly three years old as yet, but it is exerting a marked influence in directing the intelligent development of the wonderful mineral resources of the Black Hills. The plan upon which it is based is regarded as so eminently adapted to its purpose that it has been taken as a model by one or more of the Australian colonies in organizing a similar school. Over 40 students received instruction within its walls last year, which number will probably be increased this winter. A peculiar feature of the school is the number of practical miners who avail themselves during the winter of the opportunity presented to them for acquiring a thorough knowledge of mineralogy. The situation of the school is highly advantageous by reason of its proximity to gold, silver, lead, zinc, tin, iron, coal and other mines, which are all within a few hours' ride, so that the student can with little loss of time from his studies observe the practical details of mining almost all the minerals in ordinary use and some which are quite rare.

A correspondent of the London *Economist* reports that an English syndicate has just bought a large concern in Hagen, Westphalia, whose specialty is the manufacture of iron and tools, and is about to make a joint-stock concern out of the same. According to a perhaps prejudiced statement, it would look as if it was intended to evade the British Merchandise act by providing the goods manufactured in Hagen with the stamp of a British firm.

The Growth of West Superior.

The growth of West Superior, among the rising cities of the Northwest, is unique. Within three years its real estate valuation has risen from \$500,000 to hardly less than \$10,000,000. In 1885 the first transfers of lands, and which now forms the site of West Superior, were made to the Land and River Improvement Company, of New Jersey, a corporation organized for the special purpose of building a city at the head of Lake Superior. Its stockholders and directors were New York capitalists, merchants and lawyers and Northwestern railroad men. Their entire purchase included a trifle over 4000 acres, constituting the apex of a peninsula formed by St. Louis River and Bay and Superior Bay, including a shore line front of over ten miles, and bearing about the same relationship to the great harbor at the head of Lake Superior that Manhattan Island does New York Harbor. The original Bay of Superior (now divided into Duluth Harbor, Superior Bay and Allouez Bay), is a magnificent stretch of water, 7 miles in length and $1\frac{1}{2}$ in breadth, perfectly guarded from lake tempests by two narrow strips of land, which reach out across the head of the lake from both the Minnesota and the Wisconsin shores. West Superior, connected with five of the great railway systems of the Northwest, claims special advantage as a point of shipment between Nebraska, Colorado and Dakota to other points on Lakes Erie, Huron and Ontario, and has full confidence in her commercial future. Besides extensive mercantile docks, one of them 2900 feet in length, elevators of 8,300,000 bushels capacity and large steamship, grain and coal interests, West Superior has in course of establishment a large steel works and furnace plant under the auspices of the Land and River Improvement Company.

Last July the work of construction on the foundry building, 356 x 85 feet, was commenced, and the various auxiliary buildings let to contract. The plans as drawn contemplated a plant covering 200 acres of land. Dredging for a large coal dock has been going on ever since, and the walls of the foundry building are almost up. A very large furnace plant was included in the plans, and it was expected that one 200-ton furnace would have been erected this fall, but there is unexpected delay. It is in contemplation, however, to expend fully \$500,000 next year, with the result of bringing into existence one of the largest manufacturing plants in the West.

New Armington & Sims Engines.

The Armington & Sims Engine Company, of Providence, R. I., have recently brought out several new designs of engines, which, in many respects, are interesting, and of which we have been supplied with photographs. One of these shows a plant recently furnished for the United States cruiser Boston, for electric lighting, the engine being of the double-cylinder, double-acting design, to which we had occasion to refer some months ago. The valves for both cylinders are controlled by the well-known Armington & Sims automatic governor. The engine itself is very compact and can be run at high speed. It is connected to the dynamo by gearing. A plant of the same general type, but to couple direct to the dynamo with a flexible coupling, is at present being built for the cruiser Baltimore. The second photograph shows a compound condensing engine of 100 horse-power, being one of five built for the machine shops of the Ordnance Department, at the Washington Navy Yard. The cylinders are placed side by side, with the cranks opposite. The engines are perfectly balanced, can be run at a high speed and are particularly

well adapted for electric lighting. Compactness in both designs is a very noticeable feature, and will no doubt do much to commend the engines favorably.

Captain Jones's Reply.

Captain William R. Jones, general manager of the Edgar Thomson and Homestead Steel Works, has sent a letter to the *Ironmonger*, in which he replies to the curious comments made by our contemporary on American steel practice, taking Captain Jones's remarks at the meeting of the Iron and Steel Institute as a text. We printed both the report and the editorial comment, and may now close the incident, as the French politicians put it, by quoting the following:

The remarks I made at the Edinburgh meeting were prompted by a remark made by Mr. Clark—viz., that punching the steel was a good way to test it; and he was followed by Mr. Cooper, who stated that from conversation with American engineers he was surprised at their lack of confidence in steel as a material for bridge construction. The story I told of seeing a heat made in eight minutes I will tell again, and more fully. Visiting a steelworks making at the time of my visit soft steel, I saw them blow the heat in eight minutes; as soon as the vessel was turned down the ferromanganese (which had been drawn from a heating furnace, but at the time of being put in the ladle was cold) was added. The metal was at once poured into the mold, and I believe the reaction is still going on in that steel. I might add to this by saying that the gifted genius who made steel as described above was so uniformly successful in making bad steel that he involuntarily retired from the business; but in the meantime he had done a great deal to lead engineers to believe that Bessemer steel was not a reliable material. The average daily output of the leading Bessemer works in America will range from 900 to 1100 tons, and the work is done easily and readily, and done thoroughly well; and in my judgment no better steel is made anywhere, either Bessemer or open-hearth, than is made in America. After reviewing the principal Bessemer works on this side, I am compelled to believe that the American steel makers have good reason to be proud of their success, and we certainly are the equals of any in producing good, reliable steel.

A New Roller Bearing.—Mr. R. W. Hent, of San Francisco, Cal., has invented an improved roller bearing of the class bearing directly on both the shaft and casing, and a series of separating rollers of smaller diameter bearing neither on the shaft nor casing, but on the bearing rollers, to keep the latter separate from each other, and in which the separating rollers are kept from contact with the shaft by their bearing on the bearing rollers and from contact with the casing by their bearing on an encircling ring. This ring having only the separating rollers for its bearings, its axis is liable to shift from the axis of the shaft, and the object of Mr. Hent's invention is to limit this shifting by interposing the ring between journals of the bearing rollers on its periphery and journals of the separating rollers on its inner side, the two series of rollers being so arranged relatively to each other and their journals made the proper dimensions to insure rolling and prevent rubbing contact. This ring bears at its periphery on journals of the bearing rollers as well as at its inner side on journals of the separating rollers. It is claimed that this roller bearing is specially adapted for journals in which there is little wear, such as window pulleys and sliding door rollers. It is controlled by the San Francisco Roller Bearings Company.

The Swinerton locomotive, with polygonal drivers, first brought to notice about a year ago, has again appeared on the surface. A number of improvements are said to have been made in her machinery, and the engine is now reported running on the Boston and Maine Railroad.

Automatic Feed Pump and Receiver.

We present on this page an engraving of a new design of feed pump with receiver just brought out by the Knowles Steam Pump Works, of Boston and New York. The combination is specially intended for draining coils, radiators, heaters, drying cylinders, steam jackets, &c., and feeding the water of condensation in its hottest condition direct to the steam boilers. It is reliable and entirely automatic in its operation. It does away with the expense and annoyance of traps and tanks and returns the condensed steam to the boiler in a steady, continuous flow as fast as it accumulates in the receiver above the pump. It is not affected by the varia-

pump stops entirely. The hollow copper float cannot fill with water by "sweating" or by actual leakage, as it is drained from the bottom through the hollow arm and axis. The interior of the float is in communication with the outside atmosphere. It will be noticed that in this new design the receiver is placed alongside the pump instead of overhead as in the older form. The latter, however, is also being turned out. The outfit is made in three sizes with capacities ranging from 9 to 58 gallons per minute.

In a book on surveying, published in Germany, by Jacob Koebel, about 340 years ago, the author gives the following instruction, accompanied by a wood cut, as

IMPROVED AUTOMATIC PUMP AND RECEIVER, BUILT BY THE KNOWLES STEAM PUMP WORKS, NEW YORK.

tion of steam pressure, and is claimed to entirely prevent all snapping and "water-hammer" in pipes, so often caused by the use of traps having intermittent action. The pump and receiver can, of course, be used for other purposes than those just mentioned, as, for example, the regulation of brine circulation in refrigerating machinery and circulating purposes generally.

The operation of the outfit will, no doubt, be readily understood. The condensed steam or other liquid enters by the inlet nozzles at the top, shown at the right, and gravitates to the bottom of the receiver. As soon as it rises to a certain level it raises a float, which through lever connections, shown in the engravings, starts the pump. The latter takes off the water and forces it into the boiler. The speed of the pump is regulated through the float, and depends upon the quantity of water flowing in—the larger the quantity of water, the faster the pump moves. The pump slows down as the supply of water drops off, and when it ceases the

to how the length of a foot is to be found: "To find the length of a rood in the right and lawful way, and according to scientific usage, you shall do as follows: Stand at the door of a church on a Sunday and bid 16 men to stop, tall ones and small ones, as they happen to pass out when the service is finished; then make them put their left feet one behind the other, and the length thus obtained shall be a right and lawful rood to measure and survey the land with, and the sixteenth part of it shall be a right and lawful foot."

Twenty-seven boys on the nautical schoolship St. Mary's graduated at the annual examination last week. Since the school was established, in 1873, 477 boys have graduated, and fully 72 per cent. are now at sea. After dinner the boys gave an exhibition of seamanship aloft, after which the boys were mustered on deck and Captain Crowninshield addressed them. Shipowners and others were appealed to by Captain Samuels to provide places for graduates on American ships.

Friction of Piston-Packing Rings.

At the Scranton meeting of the American Society of Mechanical Engineers this week Mr. J. E. Denton gave an account of some measurements of the friction of piston-packing rings in steam cylinders with a device consisting essentially of the following arrangement:

A cylinder, M, 6 inches bore by 9 inches stroke is fitted with a piston, A, long enough to permit a packing ring, C, 1 inch wide to occupy the position shown. The ordinary packing rings B B prevent the access of steam into the space immediately surrounding C. The latter is supported upon the outer ends of the levers D D, which are pivoted at O, and have their inner ends coupled to the rod E. Motion is given to the piston A and its attachments through the piston-rod P. Motion being in the direction of the arrow, the friction of the ring C tilts the levers D, thus compressing the spring F. The resulting movement of the rod E, relative to the incasing tube N gives motion to a pencil lever, J, through the pitman G and the crank H. Consequently

Apparatus for Measuring Friction of Piston Packing Rings.

the motion of the pencil S perpendicular to the plane of the paper is proportional to the amount of friction of the ring C.

The pencil makes a diagram resembling a rectangle upon paper fastened to a board, K K. The ring C is cut once and is provided with a device, by the means of which its tension may be adjusted by a spring. Means are also provided whereby the ring may be drawn together so as not to touch the sides of the cylinder. When in the latter condition the spring F is calibrated by loading the rod E at Q with known weights and noting the resulting movement of the pencil S. The spring actually resisting the motion of the levers D is the torsion of the pivots O. The spring F is merely shown as an illustration of spring action.

Fac similes of diagrams obtained were presented. The horizontal distances on each side of a center or zero line represent

* This space is kept drained of condensed steam.

the friction on an up or a down stroke of the piston, the scale employed in the cases presented having been 250 pounds per inch.

The Coke Trade.

The one serious drawback to the coke industry at the present time is the shortage of cars, and the outlook for better shipping facilities in the near future is not encouraging. It is believed that if the car supply were equal to the demand the shipments of coke from the Connellsville region would be larger than at any time in its history. This statement is based on the present demand, which is greatly in excess of shipments, owing to the shortage of cars. For the months of August and September the output has steadily increased, until last week it aggregated 116,095 tons, which is an increase over the previous week of 550 tons. This increase is accounted for in part by the firing up of 100 ovens at the plant of the Connellsville Coke and Iron Company at Leisenring. The output for the month of September aggregated 438,307 tons, an increase of 45,035 tons over August, when the output was 393,272 tons. The shipments for the week closing on Saturday, the 8th inst., amounted to 5648 cars, distributed as follows: West of Pittsburgh, 3348 cars; Pittsburgh and rivers, 1100 cars; east of Pittsburgh, 1200 cars. These figures show a falling off of 695 cars over the previous week. The falling off was general, the Western shipments alone having decreased 425 cars, Pittsburgh shipments 100 cars, and Eastern shipments 170 cars. The shipments for September reached a grand total of 25,326 cars, distributed as follows: West of Pittsburgh, 13,916; Pittsburgh and rivers, 5270; East, 6140. This is an increase of 876 cars over August shipments. The September shipments averaged 1012 cars per day, as against 906 during August. The active ovens in the region now number 11,339, leaving but 1721 idle. One month ago there were 10,108 active and 2975 idle ovens. Prices remain at \$1 per ton, although some sales have been made and are still being made at \$1.15 and \$1.25 per ton. It is not expected that there will be any advance in the price for some time yet. The continued heavy shipments of outside coke to the various centers of supply, together with the disadvantages of the car shortage, will prevent the prices from advancing. No further attempts have been made looking to the formation of a coke syndicate, and all efforts to form one have been abandoned for the present, at least.

In the line of high chimneys, some interest is attached to the stack which has just been completed for the Clark Thread Company, at Newark, N. J. It is the highest chimney in the United States, and, for that matter, probably in the world. Three higher stacks are cited as existing in Scotland, but they were built for carrying off noxious fumes from chemical works, and not for creating a draft for steam-boiler furnaces. These chimneys are Townsend's, at Port Dundas, Glasgow, which is 454 feet high; Saint Rollox, at Glasgow, 436½ feet high, and Dobson & Barlow's, at Bolton, 367 feet high. The Clark chimney is 385 feet high, and supplies draft for 22 boilers, having an aggregate capacity of 4000 horse-power. The cost of the chimney is said to have been \$35,000.

It is much to be regretted that the question of a uniform coupling for continuous steam heating has not been decided ere this. The want of uniformity will do much to retard the settlement of a question that in other respects is progressing in a very satisfactory manner.

D

New Coal-Drilling Machine.

The Western Machine Works, of Ottumwa, Iowa, are bringing out the improved coal-drilling machine which we illustrate on this page. The cut will enable any one to understand, almost at a glance, its arrangement when in working position, making a description practically unnecessary. The machine is light and easily adjusted. By attaching the boot (which accompanies each machine) to the post extension a coal grip is available, which is securely fastened in the face of

New Coal-Drilling Machine.

the coal with the accompanying taper wedge, on which the side or direct motion will operate the same as on the post. This enables the miner to use the machine in any depth coal.

The Cost of Making Car Wheels.—E. Warne, of Easton, Pa., has printed figures, obtained from the Taylor Iron Works, at High Bridge, N. J., on the cost of making car wheels. It is based on the use of three-quarters of charcoal pig at \$26.50 per ton and one-quarter old wheels, at \$19 per ton, equal to \$24.62 per ton for the stock, four wheels being made from one ton:

Iron.....	\$6.16
Melting, core drying.....	.20
Sand, molds and cores, flour and facing..	.15
Foundry labor of molding and casting....	.85
Outside work, unloading materials.....	.10
Repairs, wear and tear, taxes, insurance, motive power and delivery charges...	.40
Cost.....	\$7.86

With wheels selling at \$8 apiece, this would leave a profit of 14 cents per wheel.

It is of some interest to note that a class in the theory and practice of steam engineering will be formed next month by the Young Men's Christian Association, of New York. The class will commence on November 14, and will meet Wednesday and Friday evenings from 8 until 10 o'clock, the term closing on April 29, 1889. The purpose of the class is to give instruction in those subjects which must be mastered to enable one to pass an examination for an engineer's license before the New York Police Department. Only iron-works employees or those who are working in machine shops or fire and engine rooms will be admitted as pupils. The services of Mr. William H. Weightman as instructor have been secured.

Moisture in Iron Ore.

Several iron importers have been engaged in a legal contest with the United States Government respecting the payment of duties on moisture in iron ore, or only on the ore itself. At Philadelphia, on the 12th inst., Judges McKennan and Butler, of the United States Circuit Court, took up the suits by John W. S. Earnshaw, an importer of that city, and by Sebastian B. Schlessinger, Clark L. Lehman, J. Mitchell Clark and Ludwig Dreier, of the iron house of Naylor & Co., of Boston and Philadelphia, against John Cadwalader, collector of customs. Mr. Earnshaw brings his suit to recover an alleged excess of custom duties amounting to \$71.61 on three importations of iron ore. Naylor & Co. claim \$371.61. The bill of complaint alleges that in importing say 1000 tons of ore, the article will contain at least 10 per cent. of moisture, and if the ore is placed in open air where the sun can strike it there will be a shrinkage from 1000 tons to about 900 tons. It is urged that the 75 cents per ton duty can be collected only on the real importation and not on the moisture.

Mr. Isaac Fegeley, president of the Warwick Iron Company, of Pottstown, was one of several witnesses called by the plaintiffs, who testified that iron ore is bought and sold on a basis of being dried at 212°. William W. Thurston, president of the Bethlehem Iron Works, and who employs 3000 men, testified that he had purchased iron ore since 1883, and dealers always, with one exception, treated the water, which was mechanically and not chemically, combined with the ore, as distinct, and not a part of the ore, and trade was done on a basis of its being heated to 212°. At the close of the plaintiff's case, Assistant District Attorney Carr made a motion for a non-suit, on the ground that the meaning of the term iron ore had been determined by the Supreme Court as ore in the crude or natural state, and it is a question of law for the court to pass upon, and is without the province of a jury. The motion was overruled. The defense was then opened by Mr. Carr, who tried to show that the commercial designation of iron ore is ore in its natural or crude state. William D. Rees, of Cleveland, Ohio, who is in a company who produce 225,000 tons yearly, testified to the same fact. Other witnesses for the defense were Joseph D. Weeks, David F. Houston, president of the Crozer Steel and Iron Works, R. F. Smith, James Pickands and Thomas Wilson.

Powell Stackhouse, vice-president of the Cambria Iron Company, said that the person had to take his chance as to the amount of moisture contained in the ores. In recent years, 1881 and 1882, allowance for moisture was made. The custom was in vogue in isolated cases before then, but did not become general until later years. Frank S. Witherbee, of Fort Henry, N. Y., who is with a firm second in the United States as a producer of iron ore, testified that the term iron ore means the ore with water both chemically and mechanically combined. If a pile of 900 tons was placed by the side of a pile of 1000 tons, and the smaller pile was made wet with rain, so that its weight increased to 1000 tons, the intrinsic value of the two piles would be same as before, and they would both be ore, although the water does not increase the metal. Louis E. Stanton, of Crocker Bros., of New York, corroborated the testimony of the water witnesses. The remaining witnesses that were called were George H. Ely, president of the Western Iron Ore Association; William D. Marvel, J. Wesley Pullman, Robert C. Thomas and John M. Hartman. The interest in the suit was very much restricted by the court practically ruling out testimony

which referred exclusively to domestic ores. The salient points of the case were presented in writing both by the defendant and the plaintiffs, and in the charge to the jury the court gave written affirmations or objections to these various points, and then addressed the jury upon the testimony. Without going into the detail of the charge of the court, or attempting to touch upon the various points made, it is fair to assert that the principal issue which the jury had to decide was whether sufficient evidence had been presented to prove that the custom, even in handling foreign ores, is to sell them as ore dried at 212° F., or whether this provision was not expressly stipulated in all or many of the contracts which were made for dry ore. While the Government might have strengthened its case in several points, it was in the main well conducted, and notwithstanding the fact that the ruling above mentioned interfered somewhat with the plan laid out it was evident early in the trial that the plaintiffs would not be able to sustain their claim. It was no surprise, therefore, to find a verdict for the Government returned by the jury after they had been out for the hour which the court took for recess at noon.

Improved Bench Dog.

A new bench dog has been brought out by Larson & Frauman, of Anoka, Minn., who are the sole manufacturers. It is the invention of Frederic Larson, to whom letters

Improved Bench Dog, Made by Larson & Frauman, Anoka, Minn.

patent have been issued covering its essential features. The accompanying cut illustrates the device and the method of its use. As shown here, a block is held in position by the dog, but it is intended to hold a board of any length, limited of course by the length of the bench. The illustration is slightly imperfect in representing an upward curve at the toothed end of the dog. As the device is now made, the dog lies flat, so that a very thin board can be held by it, even down to $\frac{1}{8}$ -inch in thickness. It consists of a longitudinally reciprocating bar, provided with rack teeth on the side to engage with a toothed segmental lever, which is pivoted to the frame and cap-plate. A pawl is placed in front of the segmental lever to secure it in place, a stiff spring causing the pawl to operate automatically as the dog is tightened up to the board by the lever. The objects of the device are, to inclose, protect and guide the sliding dog by a frame extending substantially its whole length, and to afford facilities for securing the dog at both ends to the top of a bench. To fasten the dog to a bench, it is provided at each end with a downwardly projecting pin slightly inclined to the rear to enter holes which are bored in the top surface of the bench, 24 inches apart. The dog is specially adapted to use in cabinet shops for hard wood when very thin material is being worked. It can also be used with advantage by gunsmiths to hold their guns in finishing. It is made of the best malleable cast iron, nickel plated, is 7 inches long, and weighs about 1 pound.

The Lake Fleet.—The magnitude of the commerce of the Northern lakes as described during the present season of navigation is the cause of wonderment. A Cleveland correspondent says: "On account of the very large increase in the tonnage on the lakes during the last few years it is impossible to give an exact statement of the amount of tonnage passing through the St. Clair Flats Canal and the Detroit River, but a fair estimate can be made. In 1887 there were built on the lakes 60 new vessels, all but two of them steamers. Their aggregate carrying capacity in gross tons was 108,525, and total cost \$8,325,000. It is safe to say that the coming winter and spring will see that amount almost duplicated. Cleveland has at the present time a fleet of 229 vessels, with an aggregate registered gross tonnage of 155,188 tons, and a carrying capacity very nearly double those figures. Of these 111 are wooden steam vessels, 10 steel and iron vessels and 109 sail vessels. Detroit and Buffalo follow Cleveland very closely, their aggregate tonnage being not far from 300,000 tons. Chicago has about three-quarters as much as Cleveland, and other ports on the lakes nearly one and one-half times as much. This makes a total of 795,000 tons on the chain of lakes. This entire tonnage, loaded, makes on an average one trip a week through the St. Clair Flats Canal. By reckoning the lake season as 30 weeks, from the 1st of May to the 1st of December, the enormous total of 23,850,000 tons is given as the record of

that little channel for one year. Beside these figures the Suez and all other canals fade into insignificance."

Some time ago we noticed the fact in these columns that the Pittsburgh suspension bridge, connecting the cities of Pittsburgh and Allegheny, was being tested, for the purpose of determining how the bridge has stood the test of wear since it was erected nearly 30 years ago. The inspection was under the charge of William Hildebrand, an engineer of New York City. The inspection was completed on Friday, the 12th inst., and in his report of it to the board of directors of the bridge company Mr. Hildebrand states that the bridge is in as good condition at the present time as when it was finished in 1859, and that with proper precautions the structure will last for 100 years more in perfect security.

From the Marquette (Mich.) *Mining Journal* of the 29th ult., we take the following table showing the shipments by ports up to date this season, in comparison with shipments for the corresponding portion of the two preceding years:

Port.	1888.	1887.	1886.
Marquette.....	612,212	645,740	684,775
Escanaba	1,545,714	1,606,525	1,151,116
St. Ignace.....	91,311	73,253	55,347
Ashland, Wis..	822,501	866,203	542,340
Two Harbors, Minn.....	279,186	299,063	243,808
Total.....	3,350,924	3,490,804	2,677,366

Standard Reference Disks.

When a gauge or caliper has been long in use the question arises whether constant service has impaired its accuracy. In deciding this question the Standard Reference Disks, of which we annex engravings, are of use. They are also useful for other purposes, being excellent in most instances where there is need of referring to standards. In shape they are round, washer-like pieces, made of steel hardened and carefully ground. The edges are bright, the sides black—a good finish which does not rust.

The disks are used, frequently without handles, for setting calipers, testing measuring tools and determining sizes in shop practice. With handles, they are used as internal cylindrical gauges. They are designed, however, to serve principally as reference, not as working gauges. The diameter of each is stamped upon it in 16ths and also in decimals of an inch. A complete set consists of 45 disks and 6 handles, and is neatly arranged in a suitable box. The $\frac{1}{4}$ -inch and $\frac{1}{8}$ -inch disks are furnished with the handles at-

STANDARD REFERENCE DISKS, MADE BY THE BROWN & SHARPE MFG. CO., PROVIDENCE, R. I.

tached. They are turned out by the Brown & Sharpe Mfg. Company, of Providence, R. I.

New Steel Guns.

The two cast-steel 6-inch guns which are to be submitted to the prescribed test for tensile strength and other qualities, and perhaps will contest the palm of superiority with the Government's built-up guns, are now practically complete, and will before long be forwarded to the proving ground at Annapolis. One is the gun made at Pittsburgh, and finished at the Washington factory. It was cast whole, and the operation was so completely successful that the company wished nothing better, as an example of its system, to be put in competition with built-up guns of the same caliber. The trimming and rough boring having been done at Pittsburgh, it was rifled, sighted and fitted with the breech-loading apparatus at the Navy gun factory. This gun is fully completed, but is perhaps waiting for its fellow competitor, the Thurlow open-hearth steel cast gun, which will be ready within a few weeks. This, also, after being cast and rough bored, was taken to the Government lathe for rifling and smoothing off.

There are also at the Washington factory between 30 and 40 of the standard built-up 6-inch guns, finished and ready to be sent to Annapolis. They will go all together, so that the proving ground will present a busy scene during the remainder of this year. Among them will be the battery of the Yorktown, which is to be the first finished of the new vessels built under Secretary Whitney's administration,

and will be ready about the 1st of December. Last week her engines had a preliminary trial and worked well. Besides the new cast 6-inch guns, the big 10-inch guns attract great interest. One of these was sent to Annapolis for testing long ago, but the official trial awaits the manufacture of a powder of a specified character by the Messrs. Dupont. Two other 10-inch guns will soon be completed, so that the three of this caliber may be proved about the same time. The Miantonomoh, which will be the first of the double-turret monitors completed, is to carry four 10-inch guns, and from present appearances by the time her successors are completed their batteries will also be ready for them. The cost of a 6-inch gun weighing 11,000 pounds is about \$7750; that of a 10-inch weighing 57,500 pounds is about \$20,500.

Torpedo-Boats for the United States Navy.

In a recent number of *Naval Intelligence*, issued by the Bureau of Navigation of the Navy Department, we find it stated that the Stiletto had her final official trials in Narragansett Bay, on August 20, 1887. The trials consisted of a three hours' run over a measured distance. The weather was very favorable, sea smooth, and no wind. The total weight carried was 9 tons 640 pounds, which included 4 tons 540 pounds of coal. The displacement with this load was 31 tons. Draft of water before trial, forward, 2 feet 9

inches; aft, 2 feet 10 inches. After the trial the draft forward was 2 feet 7 inches, and aft, 2 feet 8 inches. The mean speed for the three hours' run was 18.22 knots. The vibration at high speed was moderate. A navy compass was quite steady wherever placed. The mean indicated horse-power developed by the engines was 359. The endurance with 5 tons of coal is computed at 507 miles at a speed of 11 knots. The Stiletto was bought by the United States Government for \$25,000, and turned over to the Torpedo Station on May 28, 1888.

Messrs. Herreshoff, of Bristol, R. I., signed a contract, March 1, 1888, to build for the U. S. Navy a deep-sea twin-screw torpedo-boat, exclusive of torpedoes and their appendages, for \$82,750, of the following dimensions: Length over all, 138 feet; length on deck, 134 feet; extreme breadth, 15 feet; extreme depth, keel to crown of deck amidships, 10 feet. The keel will be rocker-shaped, the draft aft 4 feet 8 inches. The displacement will be about 100 tons, and the horse-power is estimated at 1600. The engines are to be five-cylinder quadruple expansion, driving twin screws. The two boilers are to be of Herreshoff's latest design, and placed in separate compartments forward and abaft the engine-room. Eight bilge-ejectors will give a total discharge of 280 tons per hour. A steam steering engine will be fitted to work a balance rudder of large area. The engines and boilers will be protected by coal. The interior will be divided into 11 water-tight compartments and lighted by electricity. There will be two conning-towers, one forward and one aft, with a search-light on each. The armament is to consist of two torpedo tubes, a torpedo gun aft, and three 37-pounder rapid-firing guns.

A weight of 15 tons is to be carried on trial, which will be a three hours' continuous run. If on a three hours' trial the mean speed of the boat exceeds 22 knots, a premium of \$1500 will be paid, provided the boat is accepted by the Department, for each $\frac{1}{4}$ knot in excess of 22 knots, and \$2000 for each $\frac{1}{4}$ knot in excess of 24 knots. If the speed of the three hours' trial calculated as aforesaid falls below 22 knots a penalty of \$4000 will be exacted. If the speed on trial falls below 20 knots, the Department reserves the right to reject the boat. The contract calls for the completion of the boat in 15 months.

Elastic Traces.

Foreign papers have recently directed attention to experiments which have been made in lightening the work of animals in drawing heavy loads by the use of elastic traces. It appears that some time ago M. Celler, Chief Engineer of Roads and Bridges in France, expressed a doubt whether the traces of leather or rope, or the iron chains, by which horses pull their load, could not advantageously be replaced by more elastic appliances, which would diminish the effort needed at starting, to overcome the inertia of a heavy cart or omnibus. Every one has noticed that a dray-horse is often obliged to use all his weight and strength to start a vehicle which moves along easily enough when once set in motion, and it is quite conceivable that springs in the harness might make the work easier by distributing the movement of starting over a longer period of time. Acting on M. Celler's suggestion, the directors of the Eastern Railway of France began six years ago to harness all the horses employed in shifting freight cars at their Paris station with traces made of chains having a strong spiral spring inserted in them. A large number of horses is employed in this service at the station, and the effect of the change has been very satisfactory. A considerable gain has been made in the durability of the harness, and the regularity of the work, through the diminution of the number of chains broken in the service; while the horses have done their work better and with less fatigue. The blow of the collar on the shoulders at starting is far less violent, and less injurious to the animal than under the old system, and the horses, finding that a strong, continued pressure will effect as much as the jerk which was formerly necessary, seem to gain courage, and pull steadily and directly, instead of wasting their strength in ineffectual plunges. During the six years of trial the directors of the company have become so convinced of the superiority of the new mode of harnessing that it has been adopted in all portions of the vast network of lines under their control.

The Persian Minister at Washington expresses himself freely in regard to men and things in America. He says that if the present Minister to Teheran had been appointed five years ago there would have been a Persian representative in the United States much sooner, and 1000 Persians would have been doing business in this country. The Persian people number 10,000,000, and if a railroad should be built securing local advantages the population would be doubled by the return of subjects who have removed elsewhere. Thus far no concessions have been made to foreigners with this object. It is not impossible that before long the Shah may visit the United States, with whom he is desirous of cultivating friendly relations. Persians desire to see something of American manufactures, as there are many things they desire to introduce.

The Wenstrom Magnetic Separator.

At the New York Metallurgical Works, of E. N. Riotte, 104 and 106 Washington street, a Wenstrom magnetic separator is in operation, Messrs. Scranton & Cook being the agents. The Wenstrom separator has been in use for over four years at Dannemora and at a number of other mines in Sweden, and has therefore passed the experimental stage in which a number of similar machines now coming before the public are still lingering. It differs from them in that it is capable of taking ore in large sizes, so that it is possible to eliminate by concentration a good deal of waste rock without the expense of crushing it to a fine size. The machine has a stationary field magnet, A, Figs. 1 and 2,

The particles of rock in the ore, being non-magnetic, drop off from the barrel almost immediately and fall on the first chute shown in the engraving. It may be noted in passing that the dropping of ore on the barrel in the manner shown tends to lessen the power needed to make it rotate. It runs at a speed of about 30 revolutions, the power required being relatively small. The Wenstrom machine is made in three sizes, the one used in New York having a diameter of barrel of 20 inches and a width of 15 inches. It is rated at a capacity of 3 tons per hour and will take rock up to 1½ inches in size.

The machine is employed not alone for separating magnetic iron ore, but also for converter cinder, mixed machine-tool filings, droppings from cupolas and spent

believe that the settlement of the suits with the railroads is so far in the future that we cannot afford to shut down and wait for their solution. If these discriminations are persisted in, I see no way open to other manufacturers and jobbers except to follow our example. I know of others contemplating the same move, but am not at liberty to give their names."

On the 9th inst., at Dubuque, Iowa, G. B. Mansfield, of the Westphal-Hinds Hardware Company, and other prominent business men of that city appeared before the Iowa Railroad Commissioners to show how seriously their business was being interfered with by the high rates imposed to Iowa points, being in some instances higher than from Chicago to the same points. One case might be mentioned.

Fig. 1.—Longitudinal Section.

Fig. 2.—Cross Section.

THE WENSTROM MAGNETIC SEPARATOR.

and an armature barrel, E, consisting of a number of soft iron bars, E E, separated from one another by a non-magnetic material—in this case strips of wood. The whole is bound together by non-magnetic end rings F. The bars E E are cut away alternately on the inside to make one bar project only toward the north poles of the magnet and the next only to the south poles, as is shown in Fig. 1 at E and by dotted lines. This gives each succeeding bar opposite magnetism. On each of the four sections of the magnet are wound 15 pounds of copper wire. An Edison dynamo furnishes a current of 10 amperes and 35 volts. The ore is fed to the barrel by means of a hopper, as shown in the engraving, the cylinder turning in the direction of the arrow in Fig. 2. The magnetic ore adheres to the bars of the barrel and is carried downward past the first delivery chute. Below the machine the bars, departing from the influence of the electro magnet, which is placed eccentrically, lose their power to hold the particles of magnetic iron ore and they drop off.

foundry sand and for shot at blast furnaces. It has been employed for such uses at a number of places in Sweden.

The Effect of Iowa Freight Rates.

That the cry of distress which has been wrung from Iowa shippers is genuine is proved by the announcements now being made of intended removals of business establishments from the State. We are in receipt of the following letter on this subject from R. E. Sears, president of the Iowa Barb Steel Wire Company, of Marshalltown, Iowa, written under date of the 10th inst.:

"We have decided to move our machinery East, but have not decided on the location; will wait until after the election. Our reason for doing so is that the railroads have so arranged their freight rates that the discrimination against us places us at such a disadvantage that it is impossible for us to compete with those who are manufacturing at points east of Chicago. We have been hoping for relief, but now

It was alleged that the rate to Mona on the Illinois Central was 22 cents from Dubuque, while from Chicago to Lyle, one mile north of Mona, the rate on the same road was 15 cents. The general manager of the railroad company, who was present, challenged the statement, but the production of freight bills caused him to withdraw his challenge.

The people of Iowa, who are endeavoring to build up manufacturing towns and trade centers in their State, are beset with serious troubles, and it will not be surprising if the example of the Iowa Barb Steel Wire Company has numerous followers.

The construction of a pipe line to convey natural gas to Wabash, Ind., from wells 14 miles distant, began on the 12th inst. Manufacturers are to be supplied at a nominal price and domestic consumers at a very low rate. Six-inch mains will be used. The line is to be perfectly laid and to be finished by the 1st of November.

Recent Legal Decisions.

TELEGRAPH COMPANY—ACTION BY SENDER OF MESSAGE AFTER PAYING DAMAGES.

W. C. S. & Co., brokers in Richmond, Va., wrote to P. at Charlotte, N. C., as follows: "If your customer will offer 100 shares (or any part of them) C. C. & A. R. R. stock at 43, delivered here, please wire us at our expense." Ten days later P. delivered a message to the Western Union Telegraph Company, addressed to W. C. S. & Co., which was as follows: "Party offers 100 shares C. C. & A. stock at forty-three. Answer quick." This message went delivered to W. C. S. & Co. with the price changed to "forty" by dropping negligently the word "three." Two hours after this telegram was transmitted, W. C. S. & Co. replied by wire: "Will take the hundred shares; draw at sight with stock attached." P. sent the stock and drew for \$4300; W. C. S. & Co. refused to take the stock, and as they had sold it at 41½, they had to buy it at that price to fill their contract, and they sued P. in a Virginia court and recovered their loss. P. gave the telegraph company notice of this suit that it might appear and defend it, but it took no notice of this alleged duty. P. paid the judgment and sued the company to recover the amount paid, but was defeated, and he carried the case—*Pegram vs. Western Union Telegraph Company*—to the Supreme Court of North Carolina, where the judgment was affirmed. Judge Morrison, in the opinion, said: "1. The plaintiff here, P., was not liable to W. C. S. & Co. for the loss suffered by them. They should have looked to the telegraph company. The message delivered to them was not P.'s message, and no contract was made by him through it. 2. Plaintiff cannot recover the amount paid by him in the action brought against him by W. C. S. & Co., for he was not liable to them, as we have stated; and there was no contract of agency between him and the company by which he can hold it responsible for the payment made by him. Not being liable to W. C. S. & Co., he cannot claim any indemnity from the company for his payment."

PREMIUMS OR GIFTS WITH SALES.

G. was convicted of selling food and giving away, as part of the transaction, a premium, in violation of the statute (Sec. 335 a, New York Penal Code), which provides a penalty against "any person who shall sell, exchange, or dispose of any article of food, or offer or attempt to do so, upon any representation, advertisement, notice, or inducement that anything other than what is specifically stated to be the subject of the sale or exchange is or is to be delivered or received, or in any way connected with or a part of the transaction, as a gift, prize, premium or reward to the purchaser." In this case—*People vs. Gillson*—on appeal, the Court of Appeals of New York, reversed the judgment. Judge Peckham, in the opinion, said: "Here the offense, as set out in the warrant, was the delivery of a tea-cup and saucer by the Great Atlantic and Pacific Tea Company, to one A., on a purchase by him of 2 pounds of coffee from it, the company having announced or advertised that such a gift would be made to a purchaser of 2 pounds of coffee. The defendant contends that the statute is void, as it interferes with his 'liberty' as secured to him by the constitution. 'Liberty,' in its broad sense, as understood in this country, means the right, not only of freedom from servitude, imprisonment or restraint, but the right of one to use his faculties in all lawful ways, to live and work where he will, to earn his livelihood in any lawful calling, and to pursue any lawful trade or avocation. It is quite clear that some or all of these fundamental and valuable

rights are invaded, weakened, limited or destroyed by the legislation under consideration. It is, evidently, of that kind which has been so frequent of late—a kind which is meant to protect some class in the community against the fair, free and full competition of some other class; the members of the former class thinking it impossible to hold their own against such competition, and, therefore, flying to the legislature to secure some enactment which shall operate favorably to them, or unfavorably to their competitors, in the commercial, agricultural, manufacturing or producing fields. By the provisions of this act a man owning articles of food which he wishes to sell or dispose of is limited in his powers of sale and disposition. It is lawful to sell coffee, and the defendant here may be satisfied to take a less profit upon a single sale by making the gift, because he can thereby increase his sales and have a greater income by reason of a greater business at the end of the year. This statute, if valid, steps in to prevent his adopting such a course to procure trade, and from it to secure an income and livelihood for himself and his family. It is contended here that the statute should be upheld on the ground that its enactment is a proper exercise of the police power of the State: 1. Because the transaction is in the nature of a lottery, indeed, the statute is placed in the Penal Code under the head of 'lotteries.' 2. That the sale of impure, unwholesome and adulterated food is thereby hindered. We are of opinion, however, that the words of the statute cannot be construed to have been intended to defeat a lottery or to declare that the sale of bad food would thereby be interfered with. The conviction must be reversed, and the defendant discharged. All of my associates concur in this judgment."

BANKING—LETTER OF CREDIT.

A firm in New York requested a bank to open a telegraph credit on its account in Hong Kong, China, as follows: "Please telegraph authority to Vogel & Co., Hong Kong, to draw at 6 months for our account against consular invoice and full set bills of lading of 2000 bales manila hemp, p. Robinson, at the rate of 4 pounds p. bale, on a basis of 8 shillings sterling, freight filled up in bill of lading, reducing advance, if higher." This credit was wired, and a letter of credit was sent by the bank to Vogel & Co. next day for £10,000. Under the telegraphic authority Vogel & Co. made three drafts amounting to £8080, at six months, on account, as stated on the bills, of 2020 bales of hemp, and the drafts were accompanied with letters of advice, which informed the bank that they were drawn against these bales of manila hemp, which had been forwarded by the ship Robinson, as directed. The drafts had been accepted by the bank's agents in London, through whom the credit had been wired, before the ship arrived in New York. Instead of shipping 2020 bales of manila hemp but 500 bales were sent, the remaining bales containing rolls of matting. To each draft was attached a bill of lading for "bales of merchandise," "weight and contents unknown" and Vogel & Co., on each bill of lading, after the captain had signed them, and without his knowledge, indorsed an abstract of invoice for "bales of manila hemp." The bank paid the acceptances, but the firm refused to pay the bank, and an action was brought against it. Vogel & Co. had absconded. Judgment was given on a draft which covered the 500 bales of hemp, but denied for the balance, and the case—*Bank of Montreal vs. Recknagel*—was carried to the Court of Appeals of New York, where the judgment was affirmed. Judge Gray, in the opinion, said: "If Vogel & Co., in any material matter, failed to comply with the terms

and conditions of the cable credit, the plaintiff's London agents accepted their drafts at their peril. Defendants cannot be held liable except upon actual consignments of manila hemp. The term "documents" in the cablegram clearly meant, in the minds of merchants and bankers, consular invoices and bills of lading. The difficulty has arisen here from the failure to specify in the bills of lading the kinds of merchandise which the defendants had authorized the plaintiffs to accept against them, and in the acceptance of drafts which were not against shipments of that kind of merchandise at all. Letters of credit are governed by the same legal principles as are all contracts. The credit here was authorized upon certain conditions prescribed by the parties to be ultimately bound, which they not only had the right to make, but which were assented to by the plaintiff. It is difficult to see how parties could more particularly define the terms of their engagements than was done in this case. It is urged that all commercial instruments are to be liberally interpreted, so as to protect persons who give credit on the faith of them. But that principle only applies where the provisions of an agreement are ambiguous, loose, or are susceptible of more than one interpretation, which is not the case here. The master of the ship should identify the goods for which he gives a bill of lading; that could have been done here; but whether it was done or not, this case cannot be controlled by it. The agreement between the parties was a definite one, and it must be enforced."

Refilling Collieries.

Among the economical inventions recently introduced at Shenandoah by the Reading Company is a device, at the Kohinoor Colliery, for refilling the excavations from which coal has been mined. The method of doing this is both simple and effective, and prevents the caving in of the earth above, and the consequent loss of valuable property, which has not been infrequent in the mining towns of the anthracite region. Besides, the valuable pillars of pure coal, which for many years it was customary to leave in the mines, to prevent falling in of the roof, can now be taken out without fear. A coal-dirt conveyor, consisting of a series of semi-circular shuttes, similar to those used in discharging coal from carts into cellars, commonly used in this city, and an endless chain with scrapers attached automatically conveys the fine refuse from the coal breakers to an elevation, from whence it is discharged into a second shutte. As the coal dirt falls on the second shutte the water pumped from the interior of the mines mixes with it and carries the fine coal dirt, in a semi-liquid state, back through a jig or puddling hole into the bowels of the earth, from whence the coal has been removed. The coal dirt settles to the bottom of the breasts and packs closely, and the water seeks an outlet below, to be again pumped out to repeat its duty. The cost of thus puddling the refuse matter back into the mines, about 3 to 4 cents per cubic yard, is comparatively very small compared with the value of the pillars of marketable coal of which the mines may be safely "robbed," and the security obtained for dwellings and railroad property on the surface, above the mines. Already more than two acres beneath the city of Shenandoah, from which the coal had been mined, have been again solidly refilled with the coal dirt which used to be piled mountains high around the town.

The St. Louis Malleable Iron Works, at St. Louis, continue idle, and will probably not resume operations before next year.

THE WEEK.

Respecting the operation of the Interstate law, President Adams, of the Union Pacific Railroad, is quoted as saying that he thought the new statute is greatly responsible for the demoralization of railroad affairs, and experience has shown that it is not based upon sound principles. The inability of roads to make lower rates on traffic between large commercial centers and intermediate local points, he says, has the effect of driving the business away from large points, and the prohibition on pools is leading to a general consolidation of roads. The weaker lines, being unable to compete against the stronger lines on even terms, will be absorbed by them.

There are 427 miles of street sewers in New York City. The total revenue from the Croton water service for the quarter was \$1,033,777.62.

Canada's commerce is severely crippled by an extensive wash-out on the Cornwall Canal, by which transportation seaward by water is summarily closed, and at a busy season of the year, when everything that could carry cargo was pressed into the service. Large quantities of grain were in transit, so that the forwarding companies suffer considerable losses.

Millions in the shape of rich gold-bearing quartz are visible at Douglass Island, in Alaska, where Senator Jones, of Nevada, has a great stamp mill of 240 stamps, rated as the largest of its kind in the world. A Sitka correspondent says this year the mill made further enlargements, until \$500,000 has been invested in the plant. The company have acquired quartz ledges along the face of the mountain for a distance of 9000 feet alongside of deep water. The mill hugs the foot of the hill quite closely, and higher up, not more than 500 feet, is the foot of the quartz quarry. The excavation in the side of the mountain resembles a giant stone quarry from whose sides are blasted in the open air hundreds of tons of gold-bearing quartz rock for the use of the stamp mill. A tramway carries the quartz to the mill, where, with water and pounding machinery, it is reduced to powder and then borne to the chlorine works 400 or 500 yards away, where the impalpable and invisible gold is separated from the dross and dust. The amount of gold-bearing quartz exposed to sight at that one point alone is enough to keep the mill in operation for an indefinite number of years.

A frightful railroad disaster occurred at Mud Run, on the Lehigh Valley Railroad, caused by the engine of one train crashing through the rear cars of the preceding train, all of which were crowded with excursionists. At least 64 persons were killed outright, a large proportion of them young men and boys belonging in Pleasant Valley and neighborhood. It does not appear that the signals were properly managed.

There are at least a dozen steamships in the tropical fruit trade which ply between the island of Jamaica and ports in the United States. A few years ago the trade was confined almost exclusively to small sailing vessels delivering their cargoes in New York. Philadelphia and Baltimore now divide the business. The island of Jamaica is destined to become one of the great fruit gardens of the world. The exports of bananas last year comprised nearly 2,000,000 bunches, all to the United States. Exports of coffee and ddyewoods likewise largely increased.

Pratt's Standard Oil Works in Williamsburg were burned on the 11th inst. The fire broke out in the hold of the oil steamer Hafia, lying at the dock, and quickly communicated to the buildings and tanks.

The bark Ella Vose and the Philadelphia and Reading Elevator were also burned. The loss to the latter is \$25,000, fully insured. The total loss is estimated at nearly \$500,000. The estimates as far as made are: Storage building, \$50,000; oil in barrels, \$50,000; docks and bulkheads and pipes, \$75,000; steamship Hafia, with cargo, \$110,000; bark Ella Vose and cargo, \$40,000; coal yards, \$20,000; other vessels and lighters, \$20,000; total, \$365,000.

The importance of American trade with Cuba appears from the single fact that in September, out of a total of 75 vessels, measuring 85,241 tons, arriving at Havana during the month, 37 vessels, of 33,075 tons, were American. British vessels numbered only 5.

Out of 18 strikers who went out of a carpet factory in Astoria, last week, only three were American citizens. The weavers objected to an American citizen learning the trade.

Plans for the Merchants' bridge at St. Louis, one terminus of which will be at Venice, in Illinois, have been adopted. There will be three spans of about 600 feet each, and the structure will cost \$1,500,000. The enterprise is a movement against Gould. The construction of the Union Railroad Bridge which the Wheeling and Harrisburg Railroad Company are building over the Ohio River at Wheeling has been begun. It will reach all the roads centering at Wheeling, West Va., and it is to be 3100 feet long. It will be finished in 1890.

Illinois farms are mortgaged to the extent of \$142,000,000, and the total mortgages on lands, lots and chattels is \$402,000,000.

The Turkish Government has decided to establish an arsenal, a dockyard and harbor works at Jeddah, and to station a flotilla for service on the Red Sea.

Proceedings having been commenced by the Attorney-General of this State to test the legality of the combination of sulfur refiners, the public are interested to learn the facts. The capital of the Sugar Trust is \$50,000,000, and its profits have been so enormous that within the past year they have declared five dividends of 2 per cent. each, or a total of 10 per cent. on the capital. It was found, however, that with the whole number of factories, the amount of sugar produced was in excess of the supply, hence these factories were shut down by order of the Executive Committee of this sugar octopus and 1000 men were thrown out of employment. The value of the property originally put into the trust was from \$15,000,000 to \$20,000,000. It was capitalized for \$45,000,000 and then increased to \$50,000,000. The profits last year of 10 per cent. were declared upon this inflated capital. The original \$20,000,000 represents the value of the property. The actual dividends upon this investment, therefore, are fully 25 per cent.

The Park Department in this city ask for \$2,000,000 for the coming year to defray the cost of a tunnel under the Harlem River at Seventh avenue and 155th street.

It is announced that the Suburban Railroad, of this city, which now runs on Third avenue nearly to 167th street, will be extended to the Bronx River, bringing into market several hundred acres of elevated land commanding fine views of the East River and the Sound.

From Adelbert Hamilton's analysis of railroad indebtedness in the United States it appears that the aggregate is more than four times as great as our national debt, and is mainly payable within the next 25 years. The annual interest charges, which are of course paid by the traveling and shipping public through fares and freights,

are equivalent to a tax of \$3 per annum upon every individual in the United States; and this, it is to be remembered, is about one-half as great as the aggregate taxation by the Federal Government through tariff and internal revenue collections.

France follows India in offering large premiums for the invention of a machine for decorticating ramie fiber, which in gloss and luster approaches the finest silk and promises to become invaluable.

The Georgia School of Technology, the only technological school which is purely a State institution, was opened in Atlanta on the 5th inst., and transferred by the commissioner who had charge of its erection to the trustees of the State University, of which it is part. The school starts with about 100 students.

The Union Trust Company have bought the buildings Nos. 78 and 80 Broadway and 5 and 7 New street for \$775,000.

Since the organization of the warehouse trust in Brooklyn and the advanced rates for wharfage and storage the bulk of the business on the water front has been transferred to Jersey City and Staten Island.

German troubles in East Africa are looked upon in England as masking a scheme for territorial acquisition.

The Treasury Department has decided that wire mattresses are not furniture within the meaning of the Tariff act, but are dutiable at the rate of 45 per cent. ad valorem as unenumerated manufactures of metal.

The value of the industrial products of Philadelphia increased between the years 1850 and 1880 from \$63,784,212 to \$152,355,318—a greater rate of increase than was ever made in an equal period before or since in the city's history.

A circular from the Marine Hospital service prescribes stringent regulations for the disinfection of all vessels which are liable to bring the germs of contagious disease.

The decision of the Supreme Court of Utah dissolving the corporation of the Mormon Church and forfeiting to the Government the estate of the Church, valued at more than \$1,000,000, is a blow which foreshadows the disintegration of Mormon institutions.

The Senate confirmed the nomination of James P. Lesesne, of South Carolina, to be consul general at Melbourne.

Louisiana sugar manufacturers are said to have expended fully \$1,000,000 within the past year for improved machinery. Each plantation of any size has its own sugar mill, in several instances at a cost of \$40,000.

Rumor has it that the stern frames of the cruiser Baltimore are cracked as the result of faulty cooling. This is contradicted by the officials, who say that all that has gone wrong with the Baltimore is the breaking of one of the rudder clutches by the scow which ran into her recently, and that the damage can be repaired for \$200.

Wm. B. Franklin, Commissioner-General, and Sommerville P. Tuck, Assistant Commissioner-General, for the United States to the forthcoming Paris Exposition, which opens next May, have been in Washington for the past several days conferring with the Secretary of State and other heads of departments respecting the Government exhibits at the exposition and details of the work devolving upon them. They report commendable progress in their preliminary work. Thousands of circulars have been distributed from their headquarters in New York city to manufacturers throughout the country, and to

leading men in all industries; and they are daily in receipt of applications for space at the exposition. These applications, the Commission announce, will not be acted on until about the 1st of December, in order that when all are in they may make an equitable division of space among intending exhibitors.

The proposed Bay of Fundy ship railway canal has been put under contract. A dispatch from Ottawa says that T. C. Keefer, President of the American Society of Civil Engineers, has received a cablegram from London announcing that a contract for the construction of a ship railway from the Bay of Fundy to Baie Verte, Gulf of St. Lawrence, has been finally settled. Mr. Keefer is one of the provisional directors named in the act of Parliament incorporating the Chignicté Marine Railway Company. The works will probably cost \$5,000,000.

The *Financial Chronicle* has the following estimate of wheat supply for the current year:

	Bushels.
Stock of last crop left over July 1, 1888.....	56,617,127
Crop estimate now made.....	411,000,000
Total supply.....	467,617,127
Consumption to July 1, 1889.....	286,110,000
Needed for seed.....	85,000,000
Export, say.....	100,000,000—421,110,000
Left over for stock.....	46,507,127

To last year's consumption should be added 2 per cent., about the rate of population increase, and to last year's figures for seed 1,000,000 bushels; still there remains 100,000,000 for export, with 46,500,000 left over for stock.

The new Mexican National Railroad has been completed, and the roadbed and bridges have been thoroughly tested. The formal opening of the road will not take place, however, until November 1. This new route to the capital at once gives importance to the City of San Antonio, which gains vastly as compared with the routes hitherto open via Eagle Pass and via El Paso.

Extensive orders for rolling stock for railroads have been placed lately in order to meet the pressing demand for transportation. Besides a large addition now making to the equipment of the Pennsylvania Railroad, the Central Railroad of New Jersey is arranging a contract for the construction of 30 new consolidation locomotives, with the Wooten fire-box, to burn anthracite buckwheat coal; 2000 40 and 50 ton cars have already been contracted for, of which 1500 are coal cars and 500 box freight cars, and in a few days an additional order for 30 fine passenger coaches will be awarded. The new cars will be built partly at Milton, Pa., and partly at a car works in the Lehigh Valley. McKee, Fuller & Co., at Fullerton, Pa., have secured a contract for building 2000 gondola cars for the Lehigh Valley Railroad, for which the Catasauqua Iron works is to supply the iron bars and other iron materials.

The whole of the new embankment of the Yellow River, begun last autumn, and carried on at a cost equal to over \$9,000,000, has been swept away by the recent flood. Nearly 1000 laborers who were on the bank were drowned.

A dispatch from Albany, N. Y., says: "In the action of Edgar Bronk against the Albany Penitentiary Commissioners, to test the question by injunction as to whether the convict labor law applies to county penitentiaries, Justice Mayhem, of the Supreme Court, has handed down a decision which in effect holds that the law passed last July, in regard to the employment of convicts in the manufacture of articles used in the prisons and reforma-

tories, does not apply to the penitentiaries, which are controlled by the authorities of the respective counties in which they are situated."

A syndicate of capitalists, at Buffalo, comprising John Kelderhouse, Thomas Maytham, M. M. Drake, Berriman Bros., H. G. Trout, James Gibson and others have closed a contract with the Union Dry-Dock Company for the construction of a steel steamer, capacity 2500 tons, to be out next spring. Keel 260 feet, beam 40 feet, hold 23 feet; fore and aft compound engine by Trout; two steel boilers by Lake Erie Works, which take an interest in the boat. Captain James Gibson of the Lackawanna will sail her. Cost, \$160,000.

The Philadelphia Bridge Works have a contract for 5,000,000 pounds of beams, girders, &c., for the Jersey Central Railroad, to be used in the construction of its handsome new depot at Jersey City, and in the building of new bridges and replacing of old wooden or weak iron ones on the lines of the company.

The Maine shipping business is active. Quite a number of square-rigged vessels have sailed from Bangor to the Mediterranean with fruit boxes and others to Scotland with spool stock.

An island has suddenly risen $3\frac{1}{4}$ feet above the surface of the water in the harbor of Vera Cruz. The city itself was recently visited by a cyclone, an earthquake and a water-spout.

Enormous quantities of iron tubing will be required within the next year or two to supply the demands of the telegraph and telephone companies, some of whom are now busily engaged in laying conduits for their underground wires. Already large orders have been placed for tubing for this purpose, which accounts for the present unusual activity of the pipe mills, and this has caused a big demand for skelp.

The powder works at Mountain View, in Passaic County, N. J., lately owned by the Lafin & Rand Powder Company, also those at Pompton, have passed into the control of the Standard Oil Company.

A special cable dispatch says: "Every detail of the Pacific Mail contract is now definitely settled between the Imperial Government and the Canadian Pacific Railway Company. The contract stipulates that the service shall commence in 18 months, the company receiving \$225,000 annually from the Imperial Government, in addition to \$75,000 from the Dominion, for a monthly service for ten years from Vancouver, not only to Yokohama and Hong Kong, as at first intended, but also calling at Shanghai. The whole efficiency of the Canadian route to the East now depends on the Atlantic service."

Dr. Warner, who lately erected the Seaside Institute for Working Girls, in Bridgeport, Conn., at a cost of \$60,000, has just subscribed \$20,000 for a building for the Young Men's Christian Association in that city, of which he is president. This is the outcome of a lecture delivered by Dr. Lucien C. Warner, of New York, the philanthropist who has just erected the library at Oberlin, Ohio, at a cost of \$75,000.

The horse-car strike in Chicago has been ended by mutual concessions, but new difficulties threaten, on account of the retention in service of new men who volunteered to fill vacant positions.

There are now being shipped from Middletown, N. Y., a lot of the largest flagstones ever quarried in the United States. They are intended to form the sidewalk in front of Frederick Vanderbilt's new house on Fifth avenue, New York. There are 20 stones altogether, and each is 20 feet long, 10 to 15 feet in width and about 12

inches thick. It is estimated that the stones when laid down in the walk in New York will have cost \$1000 apiece.

Bilbao, the great iron port of Spain, is being improved at a cost of 30,000,000 pesetas, and to reimburse the Government it is proposed to put an export duty of 25 centimes per ton on all minerals going out of the port.

The Soo Line, which has done so much to demoralize the railroad affairs of the Northwest, has given notice of an advance of rates from New York to St. Paul and Minneapolis, to go into effect on the 20th inst. The new rates will be as follows, with comparisons:

From New York, via the New York, Ontario and Western:

	Class					
	1	2	3	4	5	6
Present rates.....	\$0.91	.75	.64	.46	.36	.29
New rates.....	1.00	.91	.71	.47	.40	.33

From New York via Canada Atlantic:

	1	2	3	4	5	6
Present rates.....	\$0.80	.50	.40	.30	.24	.20
New rates.....	.95	.68	.58	.44	.38	.31

Under the new rates it is thought Chicago will have no advantage, for the through rate from New York via that city to the Northwest will be 6 cents higher than the Soo rate on first-class freight, 2 cents higher on the third, fifth and sixth classes, and 4 cents higher on the fourth class.

The city of Newark has an estimated population now of 160,000. According to the census of 1880 it was then 136,508, and 29,983, or 61 per cent., of the inhabitants were engaged in manufacturing and mining.

Most of the lines of transportation in Florida and coastwise have resumed their freight service.

The canning industry of Maryland alone comprises 488 canning houses, with 25,000 employees, who receive over \$10,500,000 in wages annually. About 22,000,000 cans are required to contain the oyster product, not to speak of the demands for packing fruits and vegetables.

At the American Institute Fair the machinery is in complete running order and the great Corliis engine is doing good work.

A very large factory for the manufacture of plate glass, the largest of its kind in the United States, has just commenced operations at Ford City, on the Lehigh Valley Railroad. The structure is 2000 feet long, with a galvanized iron roof and will contain six melting furnaces. The firm expect to make 20 plates of glass a day. In the grinding and polishing rooms are some massive machines, made on the grounds at the foundries and machine shops. They will use over 2000 tons of iron in their machinery. The polishing tables are to be run by a traction cable, working on the same principle as do the street railways. There are from 300 to 400 men employed now by the firm, and they expect when they are running in full blast to work about 1200. The furnaces, boilers, &c., are all heated by natural gas.

There is no cessation in the effort to introduce improved steam-heating processes on the various railroad lines. By January 1 the New York and New England line will have between 80 and 90 cars warmed by the New York Safety Car Heating and Lighting Company's system.

Harnessing the Niagara cataract is once more receiving attention in Buffalo, as the 582 inventors who have responded to the offer of a \$100,000 prize for the best "harness" are becoming restless. Last week a committee of citizens appointed a committee to devise a plan of organization, in order that the necessary data may be prepared by competent hydraulic engineers to put the matter in shape for competition.

MANUFACTURING

Iron and Steel.

A new process in the manufacture of crucible cast steel, known as the Kingsland-Sinclair process, has recently been invented by Le Roy Kingsland, of Pittsburgh. An experimental lot of steel was recently made by this process at the steel plant of Howe, Brown & Co., Limited, in that city, which has been tested by the Motive Power Construction Department shops of the Pennsylvania Railroad Company, at Altoona, Pa., and also by Miller, Metcalf & Parkin, at Pittsburgh, giving satisfaction. The point claimed by the inventor for his process is that a crucible steel equal to the celebrated brands of Mushet steel can be produced for about one-fifth the cost of the above-named brand.

The new plant of the Allegheny Bessemer Steel Company, at Duquesne, Pa., is rapidly nearing completion, and it is expected to be ready for operations by January 1. The Bessemer department is already finished, and filled with the most modern machinery. In the rail mill hydraulic working machinery will, in nearly every instance, take the place of roll-hands, furnacemen, shearsmen and hot-bed men.

M. V. Smith, of Pittsburgh, has received the appointment of consulting engineer to the Union Steel and Iron Company of St. Joseph, Mo., which has recently been organized.

Oliver Bros. & Phillips, of Pittsburgh, will commence work soon on the erection of a soaking pit furnace in their Thirtieth street steel works.

The car-wheel foundry mentioned some time since as projected at East Chicago, near Hammond, Ind., is now in course of construction. The principal owner is C. A. Treat, of the C. A. Treat Mfg. Company, Hannibal, Mo. The new plant is to be of the most approved character. The buildings will be of brick, with iron roofs supported by steel trusses, and they will be equipped with hydraulic cranes, improved pits, &c. The capacity of the foundry will be from 200 to 250 wheels daily.

In the Pittsburgh papers recently was published a statement to the effect that the plate mill of Shoenberger & Co., of that city, had resumed operations after an idleness of six months. This statement is erroneous, as the plate and sheet mills of this firm have been in continuous operation for some months past with plenty of orders on hand. The firm have recently started up their nail plate train, on which tack plate is being rolled to be sold to outside concerns. The firm are not making any nail plate for their own use, as their nail factory has been closed down since July last and will be idle for an indefinite period.

The Clinton Rolling Mills, at Pittsburgh, formerly owned by Graff, Bennett & Co., and which have been idle since the assignment of that firm some months ago, have been put in operation by the syndicate of creditors who purchased the plant at the recent sale. A majority of the old employees were given positions in the works. Clinton Furnace, which supplies pig iron for the plant, is also being operated by the same syndicate, and is producing about 50 tons of pig iron per day.

Dilworth, Porter & Co., Limited, proprietors of the Glendon Rolling Mill, at Pittsburgh, started up their plant on Monday, the 18th inst., with non-union men. The firm manufactures railroad and boat spikes exclusively, and is the only firm

in Pittsburgh employing workmen belonging to the Amalgamated Association that has not signed the Amalgamated scale, in consequence of which their works have been idle since July last. In order to fill their orders and retain their customers the firm have been purchasing spikes for some time from Richmond, Va. It is thought that the firm will have no trouble to secure a full complement of hands to operate the works.

The Cambria Iron Company's new Bessemer steel works will be completed and ready for operation by January 1. They will have a capacity of from 1000 to 1500 tons per day.

W. D. Wood & Co., Limited, of Pittsburgh, manufacturers of the well-known patent planished sheet iron, whose works are located at McKeesport, Pa., are erecting a new office at that place, and when completed the present office of the firm, on Water street, Pittsburgh, will be abandoned.

We are informed that the report that the plant of the Elba Iron and Bolt Company, Limited, at Pittsburgh, would resume operations in a short time, is without foundation. The works have been idle since the assignment of the firm some months ago.

The nail factory of the Belmont Nail Company, at Wheeling, W. Va., which has been closed down for some time undergoing repairs, has resumed operations in all departments.

Florence Furnace, of the Henderson Iron Company, at Sharpsville, Pa., which was blown out last month for the purpose of relining and repairs, will resume operations again about November 1st next.

The American Wire Company, of Covington, Ky., are adding to their plant a Garrett rod mill of 100 tons capacity, and a wire mill of 75 tons capacity, double turn, to be in operation February 1.

For some weeks preparations have been under way for resumption of work at the Pottsville Iron and Steel Company's Fish-back Steel Works. The fires were lighted on Monday morning after several months' idleness.

Negotiations are now pending for the transfer of the Marine Iron Works, of Bath, Me., to Gen T. W. Hyde. It is probable that the works will be started up without delay and run in conjunction with the Bath Iron Works.

From a recent issue of the *Age of Steel*, St. Louis, we take the following: "The Laclede Plate and Sheet Mill Company will likely go out of business as a distinct organization, having decided by vote to do so, we understand from a member of the company. The last of their manufactured stock at the Laclede Rolling Mills has been sold, and was shipped out last Saturday. But the impression prevails that Mr. Pad-dock, the president of the company, would be willing to lease and operate the Laclede property if it could be had on satisfactory terms. Meanwhile the mill is lying idle, owing to differences between the owners and the several parties negotiating for its use."

A Westmore furnace is being built at Hackettstown, N. J., on ground donated by the Warren Iron Company, to experiment with the reduction of zinc ores. This is to be followed by a furnace for producing iron direct from the ore.

On the morning of the 7th inst. a gas explosion occurred at the Rosena Furnace, New Castle, owned by Oliver Bros. & Phillips, of Pittsburgh. The blast had been shut off from the stack for a few minutes, and the stopping of the air current caused a reaction which filled all the

air-pipes with gas. This ignited and exploded. The air-pipes were shattered and the three blast engines badly damaged. An area of 2000 square feet was blown from the boiler house. Several workmen narrowly escaped death, but no one was injured. The loss is estimated at \$8000.

Machinery.

The American Engine Company, of Cedar Rapids, Iowa, have consolidated with the American Nail Machine Company, of Findlay, Ohio, and formed a company with a capital stock of \$250,000. The works being built by the latter company will be doubled in size, and in connection with nail machines the firm will manufacture high-speed engines from 100 to 300 horse-power.

The Beckett Foundry and Machine Company, Arlington, N. J., have succeeded the Beckett & McDowell Mfg. Company. The works, both foundry and machine shop, have been increased, and new tools added, so as to double their former capacity. They expect soon to begin the manufacture of Corliss engines.

The Jeffrey Mfg. Company, of Columbus, Ohio, manufacturers of the Legg Coal Mining Machines, report heavy shipments.

The Lincoln Iron Works, of Rutland, Vt., have just issued a new catalogue, illustrating and describing their various stone and marble working-machines and hoisting engines for quarries. The catalogue is very attractively arranged, and is in all respects a creditable specimen of trade publication.

D. B. Cruickshank, dealer in machinery, Providence, R. I., reports the following sales of machinery: A 150 horse-power Corliss engine to the Miller Soap Company, of Lancaster, Pa.; a double cylinder hoisting engine to the Pottsville Iron and Steel Company, of Pottsville, Pa.; a 20 horse-power boiler to C. H. Eglee, of Mystic, Conn.; a 6 horse-power engine and boiler to Daniel Howe & Hope, Rhode Island; a 10 horse-power boiler to Palmer & Goss, Fall River, Mass., and two boiler feed pumps to W. A. Harris's Engine Company, of Providence, R. I.

Davies & Thomas, founders and machinists, of Catasauqua, Pa., are engaged in the erection of a large addition to their foundry department. The new building will be frame, 40 x 190 feet in dimension, with corrugated roof, and is being erected adjacent to the present foundry. When completed, it will greatly increase the present capacity of the plant.

William Tod & Company, of Youngstown, Ohio, have under way rolling-mill engines for the Lake Erie Iron Company, of Cleveland, Ohio; the Harvey Steel Company, of Newark, N. J., and a pair of specially designed engines for the tire mill of the Latrobe Steel Company, of Latrobe, Pa., of about 1000 horse-power. They are also building some heavy rail straighteners, with engines attached, for the Johnson Steel Street Rail Company, of Johnstown, Pa.

Hardware.

The Union Indurated Fibre Company, New York, report a very satisfactory sale of their dry and liquid measures, which are referred to as having received the endorsement of the city sealers of weights and measures in New York.

Freeman Wire Company, St. Louis, Mo., are making some important improvements in their mills at St. Louis. The plain wire mill is being overhauled, so that its capacity will be increased to some 50 tons daily output, and a new Corliss engine of 250 horse-power is being put in with additional blocks for fine wires. The company are also building a new baker with

improved features, so that it is expected that one man will handle the same quantity of work as has heretofore required the services of three men. They are also putting ten new two-point machines in their bar plant, and are building an electric-light plant, which will light up both of their mills. The office and salesroom of the company have been moved to 410 North Main street, St. Louis, where they have just completed the putting in of some machinery for manufacturing bank, store and office fixtures, elevator inclosures, stable fixtures, window guards, iron crests and iron and wire fences.

The Challenge Wind Mill and Feed Mill Company, of Batavia, Ill., are enjoying a heavy export trade, particularly to South America. They have recently taken large orders for the Argentine Republic, and are making shipments to Brazil via Rio Janeiro. Their home trade, which is their mainstay, is also reported to be in excellent shape.

Hussey, Binns & Co., Limited, shovel manufacturers, whose factory is on Twenty-seventh street, Pittsburgh, report a marked improvement in trade during the past few weeks. They are now engaged on a large order to be shipped to New Zealand, and the factory is running at full capacity. Not long since a large order was sent to Honolulu, and for years large shipments have been made to Australia.

Miscellaneous.

The Youngstown Car Mfg. Company, of Youngstown, Ohio, are filling a large order for cars for the H. C. Frick Coke Company, of Pittsburgh.

The Pennsylvania Railroad Company have placed orders for 1500 additional box cars. Seven hundred of the new cars are to be built at the company's shops at Altoona, and contracts for the construction of the remaining 800 have been divided between the following car works: Murray, Dougal & Co., Limited, Milton, Pa.; the Jackson & Woodin Mfg. Company, Berwick, Pa.; the Carlisle Mfg. Company, Carlisle, Pa.; the Lebanon Mfg. Company, Lebanon, Pa.; Pardee, Snyder & Co., Watertown, Pa. The contract for this new equipment was divided on account of the immediate necessity for the use of the cars, and they will be built as quickly as possible. The orders for the iron materials to be used in their construction were placed almost as soon as the contracts were secured.

The following companies have been incorporated in Illinois: The Lansberg Brake Company, at Chicago; capital, \$2,000,000; for the manufacture of air brakes; incorporators, Henry Heil, Frank Lansberg and G. W. Pfeiffer. The Sharpneck Journal Mfg. Company, at Chicago; capital, \$1,200,000; for the manufacture of journal-boxes; incorporators, S. A. Stevens, Legrand Smith and Pliny B. Smith.

Fred. H. Holton & Co., of Cambridgeport, Mass., have built a copper rolling mill, which is now in operation. They will run it principally to supply their own wants. They use about \$200,000 worth of sheet copper annually in the manufacture of bathtubs, copper boilers and sheet-metal work.

The Newburg Iron Ship Building Company have sold the entire plant of the company to the Chesapeake Dry Dock and Construction Company, of Newport News, Va. The machinery will be transferred as soon as practicable. The Chesapeake company have the largest dry dock in the United States.

Volume IX of the Transactions of the American Society of Mechanical Engineers has just been issued. It gives the full pro-

ceedings of the Philadelphia and Nashville meetings during the past year, and, like the preceding numbers, is full of information of the greatest interest and value to engineers generally.

Natural Gas in China.

Consul Denby sends to the State Department, from Peking, an abstract of an account given by Baron von Richtofen, of natural gas wells in China. These wells are found in Sz'chwan, near a town called Tsi-lin-tsing. In an area of 27 li (9 miles) diameter salt wells are found. To make a well the Chinese use a long and elastic bamboo pole, supported in the middle by a cross piece, a rope made by coupling the ends of long (not twisted) slices of bamboo, and an iron instrument which weighs 120 catties (catty = $1\frac{1}{4}$ pounds). The rope is fastened on the thin end of the pole, and the iron on the end of the rope. A slight up and down motion of the thick end of the pole makes the iron hop and bore a vertical hole with its broad, sharpened edge. The ground to be perforated consists chiefly of sandstone and clay. When a portion of the rock is mashed, clear water is poured into the hole, a long bamboo tube with a valve in the bottom is lowered, and the turbid water raised to the top. Pipes of cypress wood are rammed in to protect the sides of the bored hole and to prevent the water contained in the surrounding ground from getting access to the well; the pipes are attached to each other at the ends with nails, hemp and tung oil. The inner width of the pipes is about 5 inches. As the work proceeds the pipes are rammed deeper, and a new one attached on the top; the rope, too, is made longer. At a depth varying from 70 to 100 chang (700 to 1000 feet) the brine is struck, and the well is fit for use. The brine is raised to the top through long bamboo tubes and bamboo ropes, as described, by means of a horse-whim, and then carried to large pans for evaporation, or led to them through bamboo pipes. Beside these wells there are others, which are bored to the depth of from 1800 to 2000 feet. At that distance below the surface petroleum is struck. Immediately on reaching it an inflammatory gas escapes with great violence. Work is now stopped, and a wooden cap fastened over the mouth of the pit, perforated by several rows of round holes. In each of them a bamboo pipe is inserted, and through these the gas is led under the evaporation pans. The pipes ramify, and on each end a tapering mouthpiece, terminating in a small aperture, is attached. The gas is then used for evaporating the brine.

The enterprising spirit which induced the Chinese to examine the ground at so great a depth is said to have had its origin in the drying up of a brine pit. The proprietor was in hopes of meeting brine at a greater depth, but found instead the gas. When the country was infested with rebels during the Taiping rebellion they removed the cap from one of the gas pits and set fire to it. Since that time, or at least up to the time that Baron Richtofen wrote, a long column of fire rose from that pit, and it is considered nearly impossible to stop the flame.

The gas pits and brine pits are owned separately by corporations. The owners are subjected to the control of the Government. The Government monopoly is in the hands of the "Taotai," who resides at the place. The salt works of Tsi-lin-tsing yield considerable revenue to the Government, and have, besides, enriched numerous proprietors, and given occupation to a numerous population. The number of "fire pits" is 24, and the salt pits are innumerable. Some of them do not enjoy the advantages of gas. The brine is evap-

orated with grass and wood. There are salt pits in neighboring localities on the Min River, but no gas pits.

History of the Gas Engine.

Sir Frederick Bramwell, in his recent address before the British Association for the Advancement of Science, remarked:

The gas engine is no new thing. As long ago as 1807 a M. de Rivas proposed its use for driving a carriage on ordinary roads. For anything I know, he may not have been the first proposer. It need hardly be said that in those days he had no illuminating gas to resort to, and he proposed to employ hydrogen. A few years later a writer in *Nicholson's Journal*, in an article on "Flying Machines," having given the correct statement that all that is needed to make a successful machine of this description is to find a sufficiently light motor, suggests that the direction in which this may be sought is the employment of illuminating gas, to operate by its explosion on the piston of an engine. The idea of the gas engine was revived, and formed the subject of a patent by Barnett in the year 1838. It is true this gentleman did not know very much about the subject, and that he suggested many things which, if carried out, would have resulted in the production of an engine which could not have worked; but he had an alternative proposition which would have worked. Again, in the year 1861, the matter was revived by Lenoir, and in the year 1865 by Hugon, both French inventors. Their engines obtained some considerable amount of success and notoriety, and many of them were made and used; but in the majority of cases they were discarded as wasteful and uncertain. The Institution of Civil Engineers, for example, erected a Lenoir in the year 1868, to work the ventilating fan, but after a short time they were compelled to abandon it and to substitute a hydraulic engine.

A Peculiar Industry.—Under the above head, a current paragraph gives the following particulars of the product of the castor bean: "The oil is specially adapted for lubricating all sorts of machinery, clocks, watches, &c.; and it is an excellent lamp oil, giving a white light far superior to that of mineral oils, petroleum, rapeseed, linseed and all other oils, whether vegetable, animal or mineral; it also gives very little soot, and, all things considered, has been pronounced the cheapest oil known. All the great perfumers of London and Paris use castor oil for the manufacture of golden oil, so well known for its property of keeping the head cool, and the skin and its pores, as well as the roots of the hair, soft and open. The oil is used for textile fabrics, to fit them for dyeing or printing, for which purpose the India dyers and printers invariably employ it; and it is one of the best oils for dressing tanned hides and skins of all kinds, on account of its imparting to them such a degree of strength, durability, tenacity and beauty. From the oil cake, in addition to its other uses, a gas is obtained, which gives a superior light, some of the stations on the East India Railway being illuminated in this way. The oil dissolves completely in alcohol, and this, incorporated with a solution of copal, makes a varnish which, it is said, is very useful in polishing all kinds of first-class furniture, carriages, picture frames, cloths, canvas, &c."

A branch railroad has been completed from the Milwaukee and Northern Railroad to the iron-ore mines of the Groveland Iron Mining Company, on the Menominee range, Michigan, and the shipments of ore to blast furnaces began last week. The company will mine Bessemer ores.

The Iron Age

New York, Thursday, October 18, 1888.

The Steel Rail Trust.

The persistency of error and misrepresentation, not to use a stronger term, is strikingly illustrated by the frequent repetition of Mr. Scott's alleged figures of cost of steel rails at the Edgar Thomson works. We have shown their shortcomings in the past and have published the correct data, which were given out through Mr. Randall, but the numerous letters which have reached us since then prove that the latter have been overlooked, and emphasize the necessity of placing both side by side, although the items are not strictly comparable:

	Scott's estimate.	True cost
Pig iron.....	\$21.08	\$19.83
Spiegeleisen and ferromanganese.....	omitted.	3.24
Labor.....	4.09	4.32
Ingot molds, fire-brick, fire-clay, coke, oil, maintenance 1.2 tons Connellsville coke at \$1.35.....	not stated.	3.20
	1.62	...
Total.....	\$26.79	\$30.59
Deduct 25 lbs. steel scrap.....	...	2.18
Total.....	\$26.79	\$28.41

The Scott estimate took Bessemer pig at \$18, and added 13 per cent. waste from first to last on \$26, making it \$3.08. The actual cost figures were based on \$17 for Bessemer pig, allowing a yield of 85.8 per cent., and making a deduction for steel scrap. Mr. Scott made the stupendous blunder of assuming that it required 1.2 tons of Connellsville coke to produce a ton of rails at Edgar Thomson. Now, that establishment employs the direct process—in other words, the pig iron is taken direct in a molten condition from the blast furnaces to the Bessemer converters. No coke is used for remelting, except, possibly, in the case of accident, and for remelting the spiegel. The omission by Mr. Scott of the latter item is another astonishing error, to which must be added the neglect to provide for such sources of expenditure like molds, fire-brick, clay, &c.

To any one familiar with the manufacture of steel rails Mr. Scott's cost figures are ridiculously absurd on their face. Then it must be considered, too, that the Edgar Thomson Works are especially favored because they can use natural gas for raising steam and reheating, and because they are undoubtedly one of the best equipped works mechanically. It should be stated, too, that the cost figures give makers no allowance for the loss of revenue due to the production of seconds. It may be urged, on the other hand, that it does not cost the Edgar Thomson Steel Works \$17 to produce a ton of pig iron. Probably it does not, but the furnace plant is an independent department and charges the steel works with the market price.

Now, when it is considered that the Edgar Thomson steel plant ranks as one of the latest among the most efficient works of the world, and that even for it prices are now down to cost, the wildness of the state-

ments concerning the alleged steel-rail trust is clearly demonstrated. We have fully and frankly reported the facts concerning the Steel Rail Association. There may have been some among the manufacturers even who once attributed the rise following its creation to its existence. The different members of the association have had a very different conception of its aims and its power. Some have hoped and have urged that it be used to exercise a direct influence upon prices. Others have treated it as a means of impressing buyers with a show of power which it did not confer. Some have ostentatiously proclaimed their obedience to the dictates of the Board of Control in the matter of allotment; others have quietly sold all the rails they could get orders for with little reference to what had been assigned to them.

From his standpoint a railmaker who cannot crowd his cost below \$32 at mill may well bitterly ask what good there is in an association which cannot, or will not, stop prices from dropping to \$28 or less. When the demand in 1887 was heavy enough to give full employment not only to every mill in the association but to outsiders rolling from domestic or imported blooms, then prices rose to a level remunerative to all. When the inquiry dropped off values fell, so that a number of mills had to stop temporarily or entirely. Would a well-managed trust allow competition to degenerate in such a way, if it had the power to hold the price, even at the cost of paying a bonus to the weaker concerns? If the "trust" were as despotic as it is made to appear, would there be any sense in letting prices fall anywhere from \$5 to \$12 a ton below the cost of importing foreign rails? If the association criminally ran up prices to \$40, was it not stupidly generous, from the standpoint of the stockholders in the mills, in letting them drop off to \$28?

The rise went beyond the limits which some of the mills desired it to reach. We are informed that one of the makers proposed to the others to set aside a certain proportion of the product to keep English rails out of the Southwest and the Pacific Coast. It could not be done. The association was as powerless to control the advance as it was unable to check the decline. With all the alleged "trust" there is as much keen rivalry and sharp competition as there is among newspapers.

It may be urged that if our statement of the effect of the existence of the association is correct, it is a useless institution which the rail-makers might as well abandon. Yet they believe that it has done them some good. It collects monthly reports of sales and of shipments which are valuable to the majority of the mills. It has afforded the opportunity for at least one general meeting annually, at which the situation of the trade is discussed. It has afforded opportunities for mutual explanations and an interchange of ideas, the value of which business men in many lines of industry are more and more appreciating. We do not wish to be understood as denying that, early in the history of the association, hopes of a greater field of usefulness were entertained, probably, by the majority. Such illusions have been dispelled by the decline, but they do explain the apparently contradictory character of the reports during its history.

The Charcoal Furnaces October 1st.

A delay natural with so scattered an industry as the charcoal-iron manufacture made it impossible to present a report relating to them with the figures presented in our last issue. As will be observed from the details printed below, the charcoal furnaces are participating in the movement, now becoming so general, toward a larger output. Reports from a number of our correspondents show an active demand and a drawing upon accumulated stocks.

In New York Chatham blew in in September, and Copake is probably at work at this writing. In Maryland two Stickney and one of the Maryland furnaces are producing iron. In Virginia Beverly, Cave Hill, Pierce, Reed Island, Speedwell and Walton made together 989 tons of iron in September. In Michigan reports from every active furnace show a total output of 16,171 gross tons for last month, Spring Lake having been added to the list; Detroit has followed since, and Elk Rapids is to blow in this month. In Wisconsin Hinkle, Florence, Minneapolis and National produced together 5571 tons; Missouri with two furnaces in blast made 2350 tons; Tennessee, with five stacks, 5195 tons, and Alabama, with eight furnaces, produced 6561 tons. Bear Spring is now being run in Tennessee to work up an old stock of coal, and will make 1400 or 1500 tons of warm blast car-wheel metal. The Nashville furnace is running on coke. In Alabama Ironaton is out; Round Mountain product was reduced by labor troubles, and one Woodstock was out two weeks repairing. The tendency is toward a larger output of charcoal iron.

A Chicago pig iron manufacturer informs us that while he agrees with the statements of fact set forth in our article of last week on the Chicago coke pig iron trade, he desires to lay particular stress on the increase in productive capacity in the blast furnaces in that locality, which enables them to fully supply the local demand and will probably allow for some growth in it. He calls attention to the fact that not only are blast furnaces now in operation which formerly stood idle for months and even years, but those in course of repair are being equipped with new hot-blast stoves and other appliances intended to largely add to their output when they

are again blown in. The hold on the home trade, which has for the first time been thoroughly established this year, the home manufacturers expect to maintain, the conditions now being deemed permanently favorable for the assemblage of raw materials at Chicago at sufficiently low cost to meet the competition of manufacturers in other sections. By the control of the home trade the entire exclusion of other irons is not meant, because consumers of pig iron often have preferences for brands which they will not relinquish until there is a decided difference in price. But the general consumers, who buy at the lowest price, quality considered, are those whose trade is secured, and they are the mainstay of the market.

Steel Makers in a False Position.

Sensational disclosures have been made in a bill filed in the United States Circuit Court at Chicago by the Atkinson Car Spring Works, of that city. An injunction is asked against the American Railway Spring Company, the American Steel Association and Park, Bro. & Co., Limited, to restrain them from making unjust discriminations against the complainants to ruin their business. The statement is made that in 1887 the American Railway Spring-Makers' Association was formed to protect the interests of the manufacturers and to regulate the price of car springs. The Atkinson Car Spring Works joined this association. In March of the present year the members of the association organized a trust called the American Railway Spring Company, in which each spring manufacturer was awarded stock. Allotments of business were made according to the capacity of the several works, and out of the sales they were to pay 2 per cent. to the trust. If the business done by a member exceeded the amount he was allotted he was obliged to pay the trust 15 per cent. of such sales. A fund was thus to be created, out of which the expenses of the trust were to be paid, and a part of it was to be divided among the members whose sales should fall short of their allotment.

When the Atkinson Car Spring Works applied for membership in the trust they were allotted less than half their capacity. In the ordinary course of business, this would have compelled them to pay the trust a tax of 15 per cent. on the greater portion of their sales. A further condition of admission to membership sought to be imposed was that the applicants should exhibit to the secretary of the trust all of their contracts. They refused to make this disclosure as to their private business, and demanded a larger allotment, the result of which was that they did not join the trust. They allege in their bill that the trust, in order to drive them out of business and control the car-spring trade, set aside a fund to be used against them, so that when the Atkinson Car Spring Works made a bid on a spring contract a member of the trust would bid below cost and take the business, being reimbursed for his loss out of the fund.

Now comes the part enacted by the steel manufacturers who supply the steel to the spring-makers. It is claimed [that the spring trust made an arrangement with

the American Steel Association, which is composed largely of the manufacturers of spring steel, to have the Atkinson Car Spring Works charged \$10 per ton more for steel than the members of the trust. The American Steel Association is not a trust, but merely a trade organization, yet its members seem to have acquiesced in the wishes of the spring trust and to have taken action binding themselves to sustain it. The Atkinson Car Spring Works purchased steel of Park, Bro. & Co., and were charged \$10 per ton more than their competitors, who are members of the spring trust. Notes were given in payment for the steel, and the court is now asked to restrain Park, Bro. & Co. from collecting more than its market value, as well as to enjoin the trust from its objectionable practices in attempting to destroy the business of the complainants.

At first blush it seems almost incomprehensible that the manufacturers of steel would lend themselves to such an outrage as the car-spring trust has sought to perpetrate, and we do not believe they were fully conversant with the facts in the case at the time when they agreed to charge independent spring manufacturers \$10 per ton more than the members of the spring trust. The steel manufacturers should at once repudiate such an agreement, which is now made odious by the knowledge that it was to be used as a most powerful influence in destroying opposition to the spring trust. While the members of the trust were willing, wherever they could make a competing bid, to furnish springs below cost to keep the Atkinson Car Spring Works from securing business there was still a little chance of the latter keeping alive on work quietly obtained, but that chance was obliterated when the price of steel was so arbitrarily advanced.

It should be mentioned in justice to all interests that besides the Atkinson Car Spring Works another firm of spring manufacturers have steadily refused to join the trust. This firm is Miller, Metcalf & Parkin, of Pittsburgh. The peculiar tactics of the trust could not be used against them, however, as they manufacture their own steel.

A movement is on foot which is receiving considerable encouragement, to hold a meeting of American engineering societies abroad next year. The civil engineers, the mining engineers and the mechanical engineers have been approached and it is likely that after the ground has been sounded the enterprise will come up officially before the societies. We understand that there is a prospect of a cordial reception, providing for a week's stay at London, then a chance to attend the Paris meeting of the Iron and Steel Institute, and a week later a joint meeting of the English, French and American mechanical societies. The opportunities afforded for visiting the Paris Exhibition under peculiarly favorable auspices would probably not be lost sight of as an additional attraction. We understand that one of the steamship companies will undertake to run an extra steamer for the outward trip at special rates, providing the number of participants is over 150, the engineers being given the privilege to use their tickets for the return at any time during three months.

The Frauds at the Washington and Croton Aqueducts.

It is not surprising that irregularities, to use a mild expression, have been detected in the execution of the contracts for the two new great aqueducts which are to furnish water to the cities of New York and Washington. The term public works has become so nearly synonymous with corruption and fraud that the revelations, in connection with the Croton aqueduct at least, were almost expected, notwithstanding the fact that some attention had been given to the organization of what ought to have been an efficient staff of inspectors. We give to the Croton aqueduct the distinction of being the more likely of the two to warrant suspicion of fraudulent performances, mainly because of its New York connection, which speaks volumes for itself and which stamps nearly every public undertaking as a source of illegitimate profits to those immediately connected with its practical execution. Besides this, the Washington work was in the hands of Government engineers, of whom it was only natural to suppose that they would discharge their duties most conscientiously.

Details of the scandals which have lately been unearthed show that the shortcomings in the work are about the same in both cases, the lining of the tunnels and its backing being defective to a degree which almost surpasses belief. In the Croton aqueduct the most common form of bad work was in the backing, which, in a large number of places, consisted of dry stone packing, dumped in promiscuously and which consequently had open spaces of varying dimensions, according to the size of the stone used. Then, again, it was found that no attempt whatever had been made to fill long stretches over the arch of the lining. One particular hole was about 50 feet long on the axis of the tunnel and limited only at the ends by the roof coming too low down to permit further progress. A favorite material for filling some of the spaces appears to have been found in the empty cement barrels, over 800 of which were discovered on one division alone stowed away where there should have been solid rubble masonry. All this filling, however, as well as the empty spaces, was estimated and paid for as so much masonry at \$6 per cubic yard. The profitable character of this work to the contractors requires no comment. Of the lining itself only the first or sometimes the second ring was properly laid, many of the bricks in the others being readily removed by hand.

In the Washington aqueduct a large part of the lining is reported worse than useless, and will be pulled down and rebuilt. The backing also has been found conspicuously absent in many places, and in others consists of loose stone tumbled in without cement, the whole paid for, as in the New York work, as solid masonry. The War Department, we understand, has referred the whole matter to Major Lydecker, the engineer of the Department, for investigation and report. The responsibility in both cases can, we think, be fixed with very little difficulty. While all directly connected must bear a portion of the blame, the principal burden falls upon the engineers and contractors who were primarily charged with the faithful supervision and execution of the work.

The Light Sheet Iron Trade.

In some portions of the country, particularly in the West, a positive famine has been raging in light sheets. For weeks the demand has been so great that no stocks can be accumulated in the hands of the leading distributors at trade centers to meet the demands of the small consumers. Orders are booked in advance of receipts, which keep the stock moving from the receiving department to the shipping-room. The mills are being pressed for deliveries in advance of dates agreed upon when contracts were made, but they so anticipated their entire output that they have allowed no margin for such a condition of affairs. The work they now have in hand will keep them busy much beyond the usual active season, while some manufacturers believe they will be able to run full time until next summer.

Allusion has been made in our market reports to some of the causes of this activity in light sheets. One of the main reasons assigned, and probably the only one which has been far-reaching in its influence, is the rapid growth of the iron roofing trade. While this branch of business has shown a steady advance for years past, it has made remarkable progress this season. Careful observers estimate the consumption of sheet iron for roofing, siding, ceilings, shutters, &c., in 1888 at fully 25 per cent. above that of 1887. Numerous establishments are working up 33½ per cent. more sheet iron this year than last, some have made gains of 50 per cent., and it is stated that one concern will probably reach 60 per cent. A large part of the increased use of iron roofing has taken place in the East, whereas in previous years the West was peculiarly the home of iron roofers. This is explained by the growing favor with which iron roofing and siding are being received by owners of manufacturing establishments. Corrugated iron buildings are being erected instead of more expensive brick and stone structures. Increased room for warehousing goods is thus obtained at lower cost and with fully as great protection from fires originating outside as though brick and stone were used. Sheds, stables, depot sheds, awnings for stores and a variety of other uses in the same line calling for light and strong roofing have stimulated the consumption of sheet iron most remarkably. More iron than ever before is going into shutters, doors and other methods of protection against fire, while sheet-iron ceilings are steadily growing in favor for decorative purposes. The galvanized-iron cornice-makers constitute in themselves an important subdivision of the roofing trade, and they consume an increasing portion of the output of the sheet mills.

The gauges of sheet iron used for roofing run from No. 24 to No. 27, a favorite thickness being No. 26. These numbers being in greatest demand by the stove and stovepipe makers and manufacturers of kitchen utensils, the competition for stock between them and the roofers will be readily understood. In making shed roofs of corrugated galvanized iron heavier gauges are used, running down to No. 22. In such cases the joints are soldered instead of being standing-seamed, roofers finding iron heavier than No. 24 too stiff to make

a good joint of the latter character. The demand for light sheets growing out of the great development of the iron-roofing trade will keep up well into the winter, and promises to be renewed with even greater vigor next spring if the present prosperity of the country continues. This will be very satisfactory to the manufacturers of sheet iron who will find the demand for their product assuming more of a perennial character, although it must be admitted that this change has been gradually taking place in the past year or two. It is not a sudden development, but its effects on the trade were not marked until they produced the scarcity of stock which is now being felt. An obvious lesson to be learned from the experience of this fall is, that the general distributing and consuming trade must hereafter get their orders in early if they would have plain sailing in their busy season.

The Position of Tin Plates.

Since we last wrote editorially on the position of tin plates, two months ago, the New York market has been very active; the demand for canning purposes during the interval having proved all that was expected, especially for coke tin, which for a time could not be procured in amounts sufficient to cover requirements, and while this was the case temporarily advanced considerably. Now that the most active season is over, there is a lull; besides, the productive capacity of Wales is now evidently gaining on consumption, hence the partial reaction here coincides with receding prices on the other side. As tin plates are, however, comparatively cheap at current rates, it is not believed that there is much chance of a further decline, if any. This country has absorbed the largely increased importations with such remarkable ease that confidence in the future of the article has been greatly strengthened.

The import into the United States during the first eight months has been as follows:

Imports of Tin Plates.

	1888. Pounds.	1887. Pounds.
Imports.....	456,109,658	431,223,021
Re-export.....	664,596	1,009,661
Net import.....	454,445,062	430,213,360
Import gross tons.....	202,877	192,062

The increase amounts to 10,815 tons, or nearly 6 per cent. The English Board of Trade returns for tin plates for the first eight months show the following amounts and distribution:

	1886. Tons.	1887. Tons.	1888. Tons.
To France.....	2,912	3,572	3,148
the United States.....	186,460	179,296	196,388
Canada.....	9,245	13,389	14,209
Australia.....	2,558	3,992	5,523
Other countries.....	31,563	35,702	44,294
Totals.....	232,738	235,901	263,562

If we except France, there is an increase in all directions.

The average price of coke tin has been:

1886.	1887.	1888.
13/2¼	12/10	13/0¼

If the advance in tin since June had been reflected in the price of plates to a much greater extent than has been the case, it is doubtful whether such large amounts of the latter could have been pushed off.

In September, prior to the present reaction, the demand continued in England on a large scale. Makers were at the

time so well supplied with orders that for the moment they seem to have felt quite independent, basing their arguments on the fact of iron being firmer and an advance in steel bars being contemplated, coal had advanced in price, and tin was again dearer, stocks of tin plates besides showing a decrease for the month of 36,000 boxes. As we approach the duller winter months, a pause in the more active demand for plates may be somewhat prolonged. Still they may prove good property to hold in view of the moderate ruling figures, and the encouraging general business prospects for the coming spring. The general impression is that next year, unless something unforeseen of an unfavorable kind happens, will be prosperous, all elements underlying the general situation pointing that way. A better insight in this respect will be afforded us after the elections, when a new leaf may be turned with greater safety. Meanwhile tin plates, in common with most other commodities not swayed by purely speculative influences, will have to pass through a short period of quietness.

OBITUARY.

ABRAHAM K. LISSBERGER.

Abraham K. Lissberger, aged 57, who was for many years a manufacturer of lead pipe in Boston and this city, died on the 11th inst. at a private hotel at Sixty-third street and Lexington avenue. He spent the greater part of his life in Boston, and in 1880 came to this city and until about a year ago was a general metal manufacturer at No. 256 Pearl street. At that time he became a sufferer from rheumatism and Bright's disease. Relinquishing all business pursuits, he went to Mount Pleasant, Mich., and afterward to Bedford Springs, Pa., with the hope of obtaining some relief. Believing himself to be materially improved in health, he returned to this city in September. A relapse ensued, and he grew steadily worse until the time of his death. Mr. Lissberger leaves a wife and three daughters.

The pioneer steamer of a new Canadian line of steamers, to trade between Charlottetown, Halifax and Boston, was completed a short time ago on the Clyde, Scotland. The Halifax, the name by which the vessel is known, is 250 x 35 x 23 feet, molded, with a tonnage of about 1600 tons. The engines of the vessel are of the triple-expansion type, the cylinders being 30 inches, 48 inches and 73 inches in diameter, with a 48-inch stroke of piston. The indicated horse-power is 3000. Steam is supplied by two steel boilers 14 feet in diameter by 17 feet 3 inches long. The grate surface is 246 square feet and the heating surface 6054 square feet. Boilers worked on trial at a pressure of 160 pounds per square inch, and the engines developed 3100 horse-power. The vessel, when tried on the measured mile, developed a speed of 15½ knots.

Eight of the new vessels of the navy are now afloat—the Dolphin, Atlanta, Boston, Chicago, Yorktown, Vesuvius, Charleston and Baltimore. Only two, however, the Dolphin and Boston, are in condition for service.

Top Mill Furnace, owned and operated by the Wheeling Iron and Nail Company, at Wheeling, W. Va., which has been undergoing repairs for some time, will blow in during the present week.

THE MECHANICAL ENGINEERS'

SCRANTON MEETING.

The ninth annual meeting of the American Society of Mechanical Engineers, at Scranton, Pa., began on Monday evening last, the opening session being held at the hall of the Young Men's Christian Association. In the absence of Mr. Horace See, the president, due to illness, there was no annual address, Mr. C. J. H. Woodbury presiding. The meeting was opened by an address of welcome delivered by Col. J. A. Price, President of the Scranton Board of Trade, in which, among other things, reference was made to the manufacturing wealth of Pennsylvania, with special regard to Scranton and its vicinity, and to the exhibition to be held at Scranton next year. This, in the words of Colonel Price, will be an exhibition of concentrated power of which great things are expected. Mr. Woodbury, after having responded to the cordial welcome extended by the city of Scranton, called upon Prof. R. H. Thurston, who presented two papers on closely related subjects. The first was on

THE DISTRIBUTION OF INTERNAL FRICTION OF ENGINES.

was then taken up. It having been found that the internal friction of an engine is invariable in any important degree with variation of power, it became an interesting and important problem to determine just how this engine friction is distributed among the various moving parts, journals, guides, stuffing boxes and piston rings. The experiments which were made for this purpose were carried out by Messrs. Carpenter and Preston with a number of different forms of engines. They were described and the results given, together with conclusions, in Professor Thurston's paper. The plan adopted was to first determine the friction of the machine in the manner already practiced by them and by their predecessors in this work, then to dismantle the engine, part by part, driving the connected parts by a pulley and belt from the main line of shafting overhead, through a transmitting dynamometer carefully standardized, and thus to secure measurements of the resistance of part after part until all the rubbing parts having been thus examined, the sum of their resistance at the normal speed of the engine should give the total internal friction of the engine and the percentages of the whole due to the resistances of each point of connection or rubbing. In each experiment the endeavor was made to secure precisely the conditions of operation, so far as was practicable, which were usual in its regular working. For instance, the engine was always heated up by its own steam when the resistances of the piston and the valves were to be measured; the speed of engine was kept the same when testing the friction of journals as when it was doing its full work; the valve, balanced and unbalanced, was tested under the usual boiler pressures, as well as unloaded, and exactly as possible, and thus every precaution that could be devised was adopted to secure precisely the results that should be observed, were such observation possible, when the machine was at work. The engine was first driven by the shafting, and through the dynamometer, with everything connected and the cylinder heated up to its usual temperature by a run, immediately preceding, under steam, the cylinder heads and steam chest cover only being removed to prevent any pump-like action of the engine while so driven. Next, the piston was disconnected, and the power demanded to give the engine its regular speed was observed with all other parts

connected and moving, thus obtaining a measure of the friction of the piston alone by differences. Then the next point of connection would be broken, and another observation would give the friction of the next successive piece, and so on until the whole engine had been gone over, when the machine was assembled again, part by part, and thus a check obtained on the previous determinations.

The other paper by Professor Thurston was entitled "Variable Load, Internal Friction and Engine Speed and Work." In this results were given of an extended series of trials made with various engines under different speeds and loads, with a view of determining the variations of the internal resistances of the engines under the imposed conditions.

Bearing directly upon some of the points involved in both these papers was a paper by Mr. T. E. Denton, which was accordingly presented also before opening any discussion. It was entitled "The Friction of Piston Packing Rings in Steam Cylinders." The description of the apparatus used for measuring this friction and a reference to the diagrams obtained by its use will be found in another column.

Mr. Denton in opening the discussion referred to the effect of water lubrication in steam cylinders and to experiments made by him which showed that between the speeds of 36 and 150 revolutions per minute no appreciable difference in the piston friction of the particular engine under trial could be observed. Mr. Woodbury briefly spoke of the use of pumps for supplying oil to journals, and also of the excessive friction in some steam pumps, due to screwing down the piston rod glands too tightly. A pump which had come under his observation, and in which the area of the steam cylinder was more than four times that of the water cylinder, was totally inoperative from this cause. Mr. Denton, in referring to the fact that with increased loads there was no increase in the friction of an engine, asked for an explanation, and offered it as his view that the various journals exerted a pump action which drew in the lubricant between the bearing surfaces. This pump action, he thought, became more vigorous as the energy transmitted through the various journals was increased. As an illustration of it he exhibited a plug which had been ground to fit a ring within the $\frac{3}{8}$ part of an inch. This plug if lubricated and inserted in the ring could be easily slid back and forth, providing it was kept going constantly, but the instant it was stopped it would stick. M. Geo. Schuhmann criticised the device designed by Mr. Denton for determining packing-ring friction, saying that it did not represent practical conditions, owing to the presence of steam-tight rings both above and below the ring of which the friction is measured. The steam acting on the outside of the ring did, in his opinion, exert an important influence upon its friction. Mr. W. F. Durfee drew attention to the effect of cylinder condensation on piston friction. In vertical engines, he said, the water of condensation was evenly distributed over the upper surface of the piston, and aided appreciably in lubricating the piston; while in horizontal engines the water, of necessity, accumulated on the lower side of the cylinder, and lubricated only that particular part. This Mr. Durfee considered an important feature in favor of vertical engines, several of which he had known to run satisfactorily for years without any lubricating oils whatever in the cylinders. Mr. Thos. S. Crane remarked that engines had been run without cylinder oils more than 30 years ago with thoroughly satisfactory results. Mr. J. F. Holloway suggested that the use of different kinds of piston packing rings might in a measure explain the varying degrees of piston fric-

tion. As directly opposed to the notion that water of condensation was an important aid to cylinder lubrication, Mr. W. E. Crane cited a case where an uncovered steam pipe supplied steam, presumably somewhat wet, to an engine. Serious difficulty with excessive friction was experienced until the pipe was covered with a non-conductor. The trouble then vanished immediately. This was found to be the case on several occasions when it was necessary to make alterations in the pipe arrangements, the supply pipe at these times being left temporarily uncovered. As regards the pump action of journals Professor Thurston thought that, where the latter were loose, such action might be very effective. He referred, also, to the influence of distorted journals, where the latter were not stiff enough to resist springing, and cited the case of the United States ironclad Dictator during the war, the shaft of which gave so much trouble from this cause that it was impossible to run the engines up to full power. Mr. Denton expressed his confidence that an engine would run fairly well without cylinder lubrication, and without danger of cutting, but he held it to be a mistake to suppose that there was no increase in friction under such conditions. Experiments which he had made showed that the increase was very decided, and the reason that it was thought not to exist in some of the older engines which had been run without oil was probably due to the fact that there were no means of determining it. The different parts in such engines were so extremely strong and stiff that the vibrations, which would ordinarily result from greatly increased friction in weaker structures, were not perceptible. As an illustration, he brought up the case of a Buckeye engine, in which the increased friction, due to discontinuing the use of cylinder oil, caused a loud clanking noise, which again disappeared on introducing oil. He cited also the case of the reverse lever of a locomotive, which, when oil was used on the valve, could be easily held in position with one hand. Leaving off the oil, the friction became so great that it was impossible for two men to hold the lever back. Mr. Denton's remarks concluded the discussion.

The meeting was adjourned shortly after 10 o'clock.

Tuesday, October 16.

The morning session was opened at 10 o'clock. The report of the council was first presented, and directed attention among other things to the invitation extended by the British Institution of Mechanical Engineers to hold a joint meeting at London next year, and also to visit Paris, where a joint meeting with the British Iron and Steel Institute is in prospect. Messrs. Wiley and Hutton were appointed a committee to give the matter further consideration. Thirty new members, four associates, and seven juniors were elected, bringing the total membership of the society up to £03.

Reports were also presented by the secretary for the Library and Finance committees, the committees on Uniform Tests, Standard Flanges, and Uniformity of Duty Trials of Pumping Engines. Progress in the work of all these committees was reported, and the committees themselves were continued. The report of the tellers, which was then presented, showed that the following officers had been elected for the ensuing year: President, Herry R. Towne; vice-presidents, Wm. Kent, Thos. J. Borden, and C. B. Richards; managers, Geo. M. Bond, F. H. Ball and William Forsyth; treasurer, W. H. Wiley.

A resolution was then offered by Mr. James T. Boyd, aiming at the reduction of the number of meetings of the society to one every year. An animated discussion

ensued in which a large number of members took part, among them Messrs. Babcock, Durfee, Holloway, Trump, Lyne, and Professors Thurston, Hutton and Wood, all of whom strongly opposed the resolution. On motion the latter was laid upon the table. Secretary Hutton having made several announcements relative to excursions and other details of the meeting, the first paper of the session was presented by Mr. Charles T. Main. It was on

THE USE OF COMPOUND ENGINES FOR MANUFACTURING PURPOSES.

Mr. Main stated that if steam is to be used for power exclusively the compound engine of proper design, in its common form, is now admitted by nearly all to be the most economical, especially if considered simply with reference to the efficiency of the steam, without considering the efficiency of the mechanism and the increased cost of the plant over other types. If more or less low-pressure steam is required for other purposes than power, this type in a special form can be used to advantage except in such cases as require nearly or quite the same amount of low-pressure steam as would be exhausted from an engine producing the amount of power required. Such a condition as this might exist where small amounts of power and large amounts of low-pressure steam are required, as in a dyehouse or printery, or in case a portion of the power is produced from water and the other portion from steam, the power of the latter being such as to supply the required amount of exhaust steam for the various purposes to which it is put. In such cases as these it would be absurd to add a condensing cylinder to the engine, and then supply the low-pressure steam direct from the boilers through reducing-valves. The proper type to use here would be the simple high-pressure engine for ordinary pressure, say up to 100 pounds per square inch above the atmosphere. Between these two extremes, of steam used for power only and an amount of low-pressure steam used equivalent to the whole amount exhausted from the engine, lie nearly all the cases of ordinary practice. Mr. Main then proceeded to determine which type is proper to use if a certain proportion of the steam from the engine can be used for heating purposes.

The paper was discussed at some length, special attention being drawn to the comparative value of steam and water power for mill use by Professor Hutton, who referred to a mill at Holyoke, Mass., where water power, though available and abundant, was not used, and a steam plant was erected. Mr. Babcock remarked that in some mills it was cheaper to use steam plants because large quantities of steam were used for purposes other than power, such as heating and dyeing. Mr. Durfee referred to a French design by which a water-wheel was made to drive a friction device, the heat generated being employed to raise steam for a mill. Attention was directed by a number of the speakers to the unreliability of water powers, which explained in a great measure the preference given to steam. The calorific value of coal and its bearing upon some of the results given in Mr. Main's paper was also touched upon. The question as to why the competition of low-cost water powers did not drive out the higher-priced steam plants was explained by the difference in location. Thus the low cost of production of a water-power mill might be counterbalanced by the cost of transportation to a market, while steam power mills could be located at the most desirable points and the ultimate cost of their product thus maintained sufficiently low to admit of successful competition.

Mr. W. F. Mattes, of the Lackawanna Iron and Coal Company, then addressed

the meeting, and directed attention to some of the points of interest to be noted at the works of the company during the afternoon visit there.

Mr. C. H. Peabody followed with two papers, the first being entitled "Flow of Steam in a Tube," in which were given the results of experiments made in the mechanical engineering laboratory of the Massachusetts Institute of Technology. The results are of considerable interest on account of the lack of data bearing upon the subject, and together with the means by which they were obtained are referred to at greater length on another page.

Mr. C. H. Peabody next presented a description, together with results, of

A SIMPLE CALORIMETER,

which depends on the property that dry steam is superheated by wire drawing. The first calorimeter of this type was made as follows: A piece of pipe, 6 inches in diameter and 10 inches long, was capped at each end. In the upper end was fitted a $\frac{1}{4}$ -inch pipe, bringing the steam to be tested, a thermometer cup and a steam gauge. From the lower cap a 1-inch pipe led away the exhaust steam. The supply pipe brought steam from the main steam-pipe nearly overhead. Near the calorimeter was a T which formed a pocket, with a drip at the lower opening, and a branch from the side opening leading to an angle valve in the upper cap of the condenser. The pipe, further, was well wrapped with hair felt, and it was assumed that the steam had the same quality as in the main pipe. The calorimeter itself was wrapped in asbestos board and hair felt, and covered with Russia iron. Two other calorimeters have been made, which differ from the first only in size. One is made of a piece of 2-inch pipe, 8 inches long, and the other of a piece of 4-inch pipe of the same length. The only difference in the action of these three calorimeters appears to be that the smaller ones are more sensitive—i.e., they respond more quickly to any change of condition.

The papers were discussed at some length by Mr. Denton, this concluding the session.

The Afternoon.

as already intimated, was devoted to excursions in the city, nearly, if not all, the visitors going to the works of the Lackawanna Coal and Iron Company. We cannot here attempt to particularize all the features of interest presented, the magnitude of the establishment, moreover, permitting only a hurried inspection. Two new sets of blowing engines for the steel department were in course of erection, and attracted a good deal of attention. They were built by the Dickson Mfg. Company, of Scranton, are of the horizontal type, and have blowing and steam cylinders 54 and 50 inches in diameter, respectively, with 5-foot stroke. They were built according to designs by Mr. W. F. Mattes. Probably one of the most interesting features about the works is the utilization of waste coal. The fuel used under all the boilers consists of a mixture of culm and pea and buckwheat coal; the company have no market for these last, and hence dispose of these coals in that way. About 5000 tons per month are used, and the cheapness of the fuel explains what might otherwise appear to be a reckless disregard of all principles of economy in coal consumption. Rocking grates are used under the boilers, and an induced air-blast is led into each ash-pit. Thin fires are maintained so as to enable ready cleaning. The visitors, entering the blast-furnace blowing-engine houses, passed successively through the latter room, where the roll-turning is done, the rail mill, converter-house and other departments. An excursion was also made by a number to the Scranton electric-light station.

In the evening at 8.30 o'clock the society

was tendered a reception by the Scranton Board of Trade, at the rooms of the Young Men's Christian Association.

Wednesday, October 17.

The Wednesday morning session was called to order at 10 o'clock. After some remarks had been made by Mr. G. H. Babcock on the flow of steam, the meeting took up a contribution by Messrs. S. W. Powell and W. L. Cheney on

A SYSTEM OF WORM GEARING OF DIAMETRAL PITCH,

directed attention to the fact that there is generally confusion in the shops which use both circumferential and diametral pitches for spur and bevel gearing, as many do where patterns are on hand for gears with cast teeth of circumferential pitch, and where cut gearing is made of diametral pitch. This confusion causes an unnecessary waste of time and often consigns a good casting to the scrap heap. It could be avoided, the authors say, so far as spur and bevel gears are concerned, by making all such gears of diametral pitch, and by making worm gearing also of diametral pitch. What they propose is to cut the worm thread to a fractional pitch corresponding to one of the diametral pitches now in common use; make the tooth the same length in worm gearing as is now used in spur gearing of diametral pitch, and make no change as to clearance on the top and bottom of the thread, if there is any allowed. They propose to thread the worms by means of a pair of transforming gears put into the train of change gears of any ordinary lathe. Many small and medium-sized lathes are made with the change gears in line, and here some provision would have to be made for compounding. This can be done in a great number of cases with very little expense by making the larger of the transforming gears "dished," or with the rim offset outward, and also making a new intermediate stud long enough to take the smaller of the transforming gears together with the gear which would be put on the spindle in ordinary screw cutting. In this arrangement the larger transforming gear would be put on the spindle. Other arrangements will readily suggest themselves.

Some of the advantages which, according to the authors, would be gained by adopting this system for worm gearing are doing away with odd sixty-fourths and thousandths in the diameters of worm gears, and making their diameters come in even fractions; getting even figures in center distances between worm-gear shaft and worm-shaft or their bearings; doing away with considerable work in calculations in the drawing-room, in which there is always a chance for errors; and if in addition to using the diametral pitch and length of tooth we make the worm gears straight across the face, which, in most cases, seems to be practically as good as the more expensive way of making the points of the gear teeth follow the shape of the bottom of the worm-threads, the lathe man need not know whether the blank he was turning was to be a spur or worm gear.

A brief discussion by Mr. Crane led up to the next paper on "An Improved Method for Finding the Diameters of Cone and Step Pulleys," by Mr. C. A. Smith. The subject was divided into two parts, the first consisting of brief rules, for the practical man, for finding the correct diameters, and the second giving a history and analysis of the method.

Messrs. Sweet and Denton made some remarks, whereupon Prof. G. Lanza's paper on "The Strength of Cast Iron" was read. It contained a brief account of several sets of tests upon the strength and other resisting properties of cast iron, carried on in the Laboratory of Applied Mechanics of

the Massachusetts Institute of Technology, and recorded the results obtained. The subject thus brought up was dealt with by Messrs. Denton, Durfee and Barr.

Mr. J. E. Denton's paper on

THE IDENTIFICATION OF DRY STEAM

was then presented. The paper was divided into two parts, the first dealing with experiments with steam jets, and the second giving general expressions for the instrumental errors of condensing calorimeters for testing the quality of steam. Mr. Denton's conclusion from his investigations were that jets of steam show unmistakable change of appearance to the eye when steam varies less than 1 per cent. from the condition of saturation either in the direction of wetness or superheating. It appeared further from the investigations that the instrumental error of portable condensing calorimeters does not theoretically interfere with the measurement of about 1 per cent. of variation in the heat of saturated steam. But in the use of such calorimeters there has always been found to exist an accidental variation of error considerably in excess of the theoretical instrumental error, even Regnault's magnificent work not being an exception in this respect. Consequently if a jet of steam flows from a boiler into the atmosphere under circumstances such that very little loss of heat occurs through radiation, &c., and the jet be transparent close to the orifice, or be even a grayish-white color, the steam may be assumed to be so nearly dry that no portable condensing calorimeter will be capable of measuring the amount of water in steam. If the jet be strongly white, the amount of water may be roughly judged up to about 2 per cent., but beyond this a calorimeter only can determine the exact amount of moisture. A common brass pet cock may be used as an orifice, but it should, if possible, be set into the steam drum of the boiler and never be placed further away from the latter than 4 feet, and then only when the intermediate reservoir or pipe is well covered. The paper was discussed by Messrs. Emery, Peabody, Weightman, Babcock and Oberlin Smith.

An interesting paper on "The Cost of Power in Non-Condensing Steam Engines" was then presented by Charles E. Emery. To this we may have occasion to refer more at length in a future issue, and will, therefore, simply say at present that Mr. Emery supplied in it means of ascertaining the probable cost under all customary conditions by short and readily carried out calculations. Messrs. Denton, Barr and Wheelock spoke on the subject.

Prof. G. Lanza followed with a paper on "Counterbalancing the Action of the Reciprocating Parts of a Locomotive." In this an account was given of the experimental work that has been done in the Laboratory of Mechanical Engineering of the Massachusetts Institute of Technology in regard to the effect of different methods in use for counterbalancing the throw of the reciprocating parts of a locomotive. After a few remarks by Mr. Emery, a topical discussion closed the session.

THE AFTERNOON

was devoted to excursions to the works of the Dickson Mfg. Company, the Pine Brook Colliery, the Boies Steel Car Wheel Works and the works of the Suburban Elevated Railroad Company. In the evening another professional session was held, at which special attention was given to the discussion of "Steel Phenomena." To this we will refer again in our next issue.

To-morrow (Thursday) will be given up completely to an excursion. A special train will leave this morning for Hawley and Honesdale. After dining at the latter place the party will be conveyed by the gravity cars of the Delaware and Hudson

Company over the Moosic Mountain via the Shepherd's Crook to Carbondale, and thence by the D. and H. main line back to Scranton through the Upper Lackawanna coal field.

The meeting so far has been well attended and much interest has been manifested in the proceedings.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., October 16, 1888.

The first session of the Fiftieth Congress is in the last stages of parliamentary existence. In the House, there has been no quorum for several weeks. In the Senate, the debate on the tariff bill is dragging along wearily and slowly. The Senators, as a rule, tarry long enough to work off their speeches on the subject, when they leave for home to await the verdict of the people on the 6th of November. There has been no quorum of the Senate for some days. Senator Allison says that the bill will not be voted upon until next winter, and it never was supposed that it would be. Senator Aldrich, one of the Sub-Committee who prepared the bill, says that he will not speak on the subject until next session. Senator Jones, another member of the Sub-Committee, has gone to San Francisco. The fate of the Senate tariff bill will be dependent entirely upon the verdict of the people on the Presidential nominees. If General Harrison shall be elected, it will mean that the people indorse the Senate idea of tariff revision. If President Cleveland should be elected, it is not likely that any further effort will be made to bother about the bill.

In the same connection it would be no surprise if the Mills bill would get through the Senate, as the weak-kneed senators, with the vote of the people before their eyes, might find ample reason to support a bill, which, on issue as it now stands, received popular endorsement.

There is no doubt that the election three weeks hence will have a decisive effect in determining the economic policy of the country in the direction of protection or free trade for some years. The discovery of the error in regard to coal in the Senate tariff bill has raised a decided commotion in political and industrial circles. Representative McComas, of the Cumberland District of Maryland, has been here and had a conference with Senator Allison. It appears that the item was inserted at the suggestion of the New England senators, but was intended to read Coal-Slack or Culm, which will go through a $\frac{1}{4}$ -inch screen instead of Coal, Slack or Culm, &c. Senator Allison has made a public statement in the Senate that the error will be corrected with other amendments proposed to the bill. It must be confessed that the Senate bill is not wholly satisfactory to the iron men, although Senator Aldrich says that, as a rule, it meets with very general approbation.

If the Republicans carry the day, the bill will be much amended in the direction of protection.

Rifles of Small Caliber.

With the introduction of repeating rifles for purposes of war a reduction in the caliber of the barrel became almost unavoidable. The French Government perceived this at a very early date, and the new Lebel rifle issued to the French army has a bore slightly less than $\frac{1}{4}$ inch. Austria and Germany for economical reasons retained in their new repeating rifles the caliber of the old breech-loaders with which their armies had

hitherto been furnished. This policy, however, has proved to be of the penny-wise type, as both Governments have now found it necessary to adopt the small bore, which has, in the first place, the advantages of decreasing the weight of the arm and increasing the number of cartridges which a soldier can carry with him into the field, and, since the adoption of the magazine is likely to lead to increased rapidity of fire, this becomes a matter of the first importance. Again, as the flatness of the trajectory depends, other things being equal, on the initial velocity of the shot, which, again, is dependent on the ratio of the weight of the shot to the powder charge, the small caliber has another advantage, for, with a large caliber, the ratio of the weight of the shot to that of the powder cannot be made to have the most advantageous value without increasing the powder charge or unduly diminishing the length of the shot. The former plan is out of the question, as the kick of the weapon is quite as great as is pleasant to the marksman now, while the latter remedy is also incapable of adoption, as it would lead to inaccuracy of fire. Both these objections can, however, be got over by the adoption of the small bore, as the powder charge need not be altered, and the length of the bullet may be made equal to that found practically to give the best results. In the Werndl rifle of the Austrian Government, the caliber of which is 11 mm., the pitch of the rifling corresponds to one turn in 724 mm., while in the Swiss Hebler rifle, having a caliber of 7.5 mm. and an initial velocity of about 1900 feet per second, the pitch is 240 mm. But by thus increasing the pitch it becomes necessary that the bullet should, to take the rifling, be provided with a thin outer shell of some harder material than lead. In the Lebel rifle a skin of German silver is used, and in the new rifle for the British Army it is proposed to employ a thin shell of steel for this purpose.

The General Deficiency bill just passed by Congress, and which is virtually the last act of the session as concerns appropriations, makes a total formidable amount. There were five deficiency bills the present year, aggregating \$19,561,382.52. This makes the total appropriated by bills purely for that purpose \$296,824,434.31. To this must be added the permanent annual appropriations, amounting to \$115,640,798.90, which require no bills. The miscellaneous appropriations for the present year will figure up \$9,500,000, as against \$4,811,991.49 last year. The estimates of the departments for the fiscal year were \$302,303,164.74, and of this amount asked for \$296,824,434.31 was granted by Congress. Of this sum but \$282,363,370 was in the bills when they were reported to the House from the various committees, the increase of \$14,401,106.31 being added in the House or Senate. The estimated revenues for the year are \$440,563,734.32, out of which must come about \$422,000,000.

Our Pittsburgh correspondent telegraphs us that important changes have taken place in the firm of Carnegie, Phipps & Co., Limited, and of Carnegie Brothers & Co., Limited. John Walker has resigned the chairmanship of Carnegie, Phipps & Co., on account of ill health, retiring altogether. He is succeeded by W. L. Abbott, till now vice-chairman, the latter post being filled by H. Curry. W. P. Palmer has been elected secretary. Henry Phipps, Jr., has resigned the chairmanship of Carnegie Brothers & Co., Limited, but retains a financial interest. David A. Stewart, until now vice-chairman and treasurer, is his successor, while J. G. A. Lieshman becomes vice-chairman.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.,
PHILADELPHIA, Pa., October 16, 1888.

Pig Iron.—The market is a shade quieter this week, but it cannot be said that prices have weakened, although the feeling is hardly as buoyant as it was some time ago. The increase in the output is probably having some influence, although as yet there is no indication of over-supply; neither is there any manifestation on the part of makers of a desire to extend sales for deliveries beyond their usual limits of time. Consumption is very large, however, and it seems as though the last quarter would be much the heaviest of the whole year, so that prices are not likely to vary a great deal, neither is there any great probability of stocks accumulating. The comparative dullness of the market, therefore, may be due, as we said before, partly to knowledge of the fact that production is increasing, and in part to the fact that purchases could not be duplicated to any extent without paying an advance in prices of more or less importance. Under these circumstances consumers are willing to wait further developments, such as the result of the Presidential election, as well as to see what effect the increase in the furnace output will have, and also to ascertain if any further increase will be made. A waiting market, therefore, is the natural outcome of recent events, and does not by any means indicate that prices are likely to react. For the present, all the good Iron that is made finds its way direct into consumers' yards, so that those who are waiting for desirable brands at prices ruling five or six weeks ago may perhaps have to wait a long time before their orders can be placed. Still there is an impression that prices are high enough for a permanency, and that a further advance might be somewhat perilous. Meanwhile quotations vary from \$18 to \$19 at tide for No. 1 Foundry, \$17 @ \$18 for No. 2, and \$16 @ \$16.50 for Gray Forge, according to character of brand, &c., with a few choice makes at the usual premium of 50¢ to \$1 7/8 ton.

Blooms.—Prices are steady, and the demand moderately active at about last week's prices, say: Nail Slabs, \$29 @ \$29.50, at mill; Billets from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$33 @ \$35 7/8 "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$30 @ \$31 for Nail Slabs; \$34 @ \$36 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—The scarcity of good Bars has finally resulted in advanced prices, which are now quoted at \$29 @ \$29.50 at mill, or \$30 @ \$30.50 delivered, with sales at these figures, holders showing increasing firmness at the extreme outside rate.

Bar Iron.—There is not quite as much firmness in Bars as was noticeable a week ago. Some of the Western mills have been offering Bars at much lower figures than those named by local concerns; but it is not known that they have taken much business. Mills around here are so full of work that they have not changed figures, although on a firm offer for a desirable specification some of them might be inclined to do so, but it would depend on the amount of work they had on their books, and the kind of order that was offered to them. Skelp Iron is still in good demand, and strengthens the Bar mills considerably. A lot of 1500 tons was taken yesterday

at 1.95¢ for Grooved, although 2¢ is the usual quotation for the general run of orders. Bars are 1.85¢ @ 2¢ for best makes, and, apart from Western competition, these are considered to be firm quotations.

Plate and Tank Iron.—Reports on this class of trade are somewhat contradictory. There is undoubtedly a great deal of work on hand, and prospects seem to be very encouraging, but prices are irregular. They are a trifle higher than they were early in September, and are steady at the advance, but that appears to be all that can be said. Large orders are sharply competed for, and only small or medium sized lots command full quoted rates, which are about as follows: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3 1/4¢; Fire-Box, 3 1/4¢ @ 4 1/4¢.

Structural Iron.—There is not much new business coming in, and some of the mills are beginning to feel a little anxious for orders. Deliveries on old contracts comprise the heaviest portion of the work that is going on, although there is a fair daily demand for small lots. Prices are unchanged as follows: 2.10¢ @ 2.15¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The demand is well maintained and mills are getting all the work they can handle for the present. Prices are unchanged, and for small lots of the best makes are about as follows:

Best Refined, Nos. 26, 27 and 28... 3 1/4¢ @ 3 1/2¢
Best Refined, Nos. 18 to 25... 3¢ @ 3 1/4¢
Common, 1/2¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28... 4 1/4¢ @ 4 1/2¢
Best Bloom Sheets, Nos. 22 to 25... 4¢ @ 4 1/4¢
Best Bloom Sheets, Nos. 16 to 21... 3 1/4¢ @ 3 1/2¢
Blue Annealed... 2.8¢ @ 3¢
Best Bloom, Galvanized, discount... 62 1/2¢
Common, discount... 67 1/2¢

Steel Rails.—Small lots are in fair demand at about \$20 at mill, but large orders are not on the market at present. There is not much doing for next year's delivery, sellers being almost as indifferent as buyers are, until they can see a little further ahead. The extreme range of prices may be given as \$28.50 @ \$29.50 at mill, according to quantity, delivery, terms of settlement, &c.

Old Rails.—There is still a singular lack of business in this market. Buyers are bidding \$23 for T's, and sellers are offering mixed lots of T's and D. H.'s at \$24, which may be taken at about that figure. Sales for deliveries at interior points are reported at from \$24.50 to \$25, but there is nothing doing in spot lots.

Scrap Iron.—The feeling is a shade firmer, holders asking extreme figures, with plenty of demand at slight concessions, which, however, are not granted. Quotations about as follows: \$21 @ \$21.50 for cargo lots; \$21.50 @ \$22.50 for carload lots, delivered, or for choice \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Merchant Steel.—A fair demand at prices quoted herewith—viz.: Tool Steel, 8 1/2¢; Machinery, 2.6¢; Crucible Spring, 4 1/4¢; Open-Hearth Ordinary Spring, 2.7¢ @ 2.9¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Wrought-Iron Pipe.—The demand seems to be increasing, and manufacturers are greatly crowded with orders. Prices are unchanged, but the feeling is so strong that a reduction in discounts may be made at an early date. Meanwhile they remain as last week, viz.: Black Butt-Welded, 52 1/4¢; Galvanized do., 42 1/4¢; Black Lap-

Welded, 62 1/4¢; Galvanized do., 52 1/4¢; Boiler Tubes, 60¢.

Nails.—There is no material change to notice, although the demand is probably a little better than it has been for some time past. Prices are quoted at from \$1.95 to \$2 from store, and on the whole these figures are fairly maintained for standard quality of Nails.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, October 15, 1888.

Pig Iron.—A few good sales are reported as having been made to the general foundry trade, and some dealers enjoyed a fair run of 50 to 100 ton orders, but others have had a very dull week. The high prices asked for certain brands have checked their sales for the time being, and they are practically out of the market until the prices of other brands advance or the makers are willing to allow a concession. Inquiries are being received from Car-Wheel manufacturers who need an additional supply of Charcoal Pig Iron, and the rapid depletion of the stocks of others will cause them also to renew purchasing, so that the demand from this source is shortly expected to develop considerable business. The architectural foundries are the dullest in the list just now, but they are reaching out for work in new channels, and prospects are bright for some of them to secure good contracts. It is expected that one of the local foundries will be able to capture a 4500-ton order for Castings for a cable road in Kansas City, which will be given out this week. Prices of Southern Coke Iron are a little easier, and if there is to be any break in the general firmness now manifested along the line it will probably begin with this Iron, which has for some time had but little foothold here. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$20 @ \$21; Alabama Car-Wheel, \$26.25; Jackson County Softeners, No. 1, \$17.50 @ \$18.50; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband) No. 1, \$19.75 @ \$20; other Ohio Scotch Irons, No. 1, \$18 @ \$19; Lake Superior Coke, No. 1, \$18 @ \$19; No. 2, \$17 @ \$17.50; No. 3, \$16 @ \$16.50; Southern Coke, No. 1 Foundry, \$17.75 @ \$18; No. 2 Foundry and No. 1 Soft, \$17.25; No. 3 Foundry and No. 2 Soft, \$16.50; Gray Forge, \$16.

Bar Iron.—The general market has been exceedingly dull. Sellers are anxiously waiting for the expected closing of large contracts for cars which have been pending for some time, and which will require a considerable quantity of Bar Iron. The "car talk" runs high into the thousands, but the only orders which are deemed positively certain to be placed at this time will foot up about 4000. Mill agents are of the opinion that car specifications will rule about 1.75¢, flat, delivered, but it remains to be seen how well the price will be maintained when actual orders are in sight. Weakness among manufacturers is rumored with persistency, but agents all insist that prices of Common Iron are firm at 1.75¢ @ 1.80¢, half extras, f.o.b. Chicago, for mill lots. Store prices for small lots range from 1.90¢ to 2.10¢, according to quantity and quality. Sales of Splice Bars have been made at 1.85¢ @ 1.90¢, delivered.

Structural Iron.—Business is quiet and without any special feature. Mill lots are quoted as follows, f.o.b. Chicago: Angles, 2.20¢ @ 2.25¢; Universal Plates, 2.25¢; Tees, 2.55¢ @ \$2.65; Beams and Channels, 3.40¢. Prices from store are: Angles, 2.35¢ @ 2.50¢; Tees, 2.60¢ @ 2.75¢; Beams, 3.80¢. A moderate movement in Car-Truck Channels is reported at 2.45¢ @ 2.50¢, Chicago.

Plates, Tubes, &c.—An improved demand for Plates has been experienced, trade from store having been heavy during the week, with a satisfactory sprinkling of mill orders. The volume of business is fully up to that of last year in this branch. Prices are firmly maintained, both from mill and from store. Tubes have advanced about 4%, and the mills are so well supplied with orders that another upward turn would not be surprising. Stocks of tubes here are quite small, so that the advance takes effect at once. Quotations from store are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢ @ 2.70¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60½% off.

Sheet Iron.—Mill agents are still unable to supply the demand upon them for light gauges. A few sales have been made for December delivery at 3¢ at mill for No. 27, but the urgency is for earlier deliveries. Small lots from store are sold by jobbers at 3.20¢ for No. 24, 3.30¢ for Nos. 25 and 26, and 3.40¢ for No. 27.

Galvanized Iron.—The situation is unchanged, stocks in warehouses here being more badly broken than ever and the mills still far behind in their orders. The lighter sizes continue to be in greatest demand. Contrary to the general expectation, prices remain as previously quoted—namely, 60% off for Juniata and 60 and 5% off for Charcoal, in small lots.

Merchant Steel.—The current trade is now confined to small lots from local consumers, but is by no means dull on that account, the sales of the past week being very satisfactory. Association prices are quoted without variation as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8¼¢ @ 9¼¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Small orders accumulate from week to week, sufficient to keep up a semblance of business, but not to impart activity to the trade. The Union Steel Company will shut down their works this week for lack of orders, but the North Chicago and Joliet mills will be kept going for another month or two. Inquiries are becoming more numerous for prices on deliveries next year, but the quantities named are about one-third of the usual requirements of each company, which is not very reassuring. As far as can be learned, no prices have been fixed in this market on next year's business. Rumors are current of sales for early delivery at low prices, but the manufacturers contradict them, and quote \$30 as the minimum.

Old Rails and Wheels.—In spite of general expectations, the price of Old Iron Rails holds its own well. A sale of 1000 tons was made at \$28.50, and another of 500 tons at \$24, and some holders are expecting to realize \$24.50 on lots which they control. Consumers in this vicinity appear to be well supplied for the present, but, on the other hand, the railroads are not offering Old Rails in any considerable quantity. Old Car-Wheels are nominally quoted at \$20, with very light transactions reported.

Scrap Iron.—A large part of the available supply of Wrought Scrap in this vicinity was bought for consumption last week. More inquiries are in the market, and bids at a shade below quotations have been refused. Mill Scrap is also in some demand, and Cast is beginning to move. Steel is rather quiet, but a few transactions are noted in this class of material also. Dealers are now paying \$14 @ \$15 for Mixed Country Scrap. The selling prices of carefully selected Scrap are as follows, per ton of 2000 lb: No. 1 Forge

or Railroad Shop, \$21; Track, \$20; No. 1 Mill, \$16.50; Pipes and Tank, \$12 @ \$13; Light Wrought, \$12; Horseshoes, \$20; Axles, \$26.50; Cast Machinery, \$15; Stove Plate, \$12; Cast Borings, \$10; Wrought Turnings, \$12.50 @ \$13; Axle Turnings, \$15; Coil and Leaf Steel, \$17; Locomotive Tires, \$16.

Hardware.—The volume of business continues about the same as that of September, merchants generally reporting a good influx of orders, with the prospects very favorable for the immediate future. No discouraging symptoms have appeared in any branch, and prices are being maintained very well. Collections are not so good as might be expected, but this is explained on the ground of the upward movement in values of farm produce. As farmers rarely sell on a rising market, those who deal directly with them will be obliged to wait until they are influenced to dispose of their stocks of grain, &c. This causes a general tightness of money all along the line.

Nails.—The manufacturers of Cut Nails have apparently weakened in their attempt to hold up prices until the combination is formed. Last week the most obstinate supporters of the regular price gave way and the rate named by one or two concerns became common. Other concessionists followed on the part of the leaders in reducing prices, and Steel Nails were sold here from factory at about \$1.90. These low rates were not made to secure large orders, as might be supposed, but to make sales of 1000 kegs and less, and it is very probable that the volume of actual business was not increased in the least by the break. Jobbers are quoting Steel Cut Nails at \$2.05 @ \$2.10 and Wire Nails at \$2.60 @ \$2.65, in small lots, and report a fair trade in progress, but no demand for carloads worth mentioning.

Barb Wire.—The demand is still very limited, and prices are extremely irregular. Small lots from store are quoted at 2.90¢ for Painted, and 3.60¢ @ 3.65¢ for Galvanized.

Pig Lead.—This market has been dull recently, and prices have receded from 5.05¢ to 4.90¢, with very slight transactions. Consumers seem to be well supplied and not inclined to speculate on the future condition of trade.

Copper.—Manufactured Copper holds its own at 25¢ rates, with fair quantities of Sheets going into the hands of roofers, and some demand from other classes of consumers.

Joseph T. Ryerson & Son, 18 to 22 Milwaukee avenue, Chicago, have issued a stock sheet for October, showing the number and size of the Iron and Steel Plates and Sheets in their warehouse at the beginning of the month. It is a 24-page pamphlet of convenient size, and contains in addition to the stock list a great deal of information of interest to Boiler and Tank manufacturers. Special attention is called to the new Eclipse Manhead, which is therein illustrated and described. This is said to be the only solution of a tight joint for a manhole. The Manhead rests on a heavy lead gasket, and can be taken off and put back again without renewing the gasket.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, October 16, 1888.

Pig Iron.—Brokers and furnacemen report little or no change during the past week; there is a very fair demand, and prices are steady. There is no pressure on the part of furnacemen to sell, nor any particular anxiety on the part of consumers; many of the former are sold up for

the present year, while many of the latter have covered their wants for the same time. The opinion generally obtains that there will be but little change in prices between now and January. It is encouraging to know that the spirit of speculation which at one time threatened to take hold of Pig Iron has died out, and is not likely to come to life again at present. Our market is in an exceedingly healthy condition, and the business is between producers and consumers, with the assistance of the brokers, who help to get the former together. The great proportion of the Iron used here is the product of furnaces here, and in the Shenango and Mahoning valley districts, very little, if any, coming here from east of the mountains, while in regard to Southern Iron there has been none sold in this market for several years. We quote prices as follows:

Neutral Gray Forge.....	\$16.00 @ \$16.50,	cash.
White and Mottled.....	15.00 @ 15.50,	"
All Ore Mill.....	17.00 @ 17.25,	"
No. 1 Foundry.....	18.00 @ 18.50,	"
No. 2 Foundry.....	17.00 @ 17.50,	"
No. 1 Charcoal Foundry.....	17.00 @ 24.50,	"
No. 2 Charcoal Foundry.....	22.00 @ 22.50,	"
Cold Blast Charcoal.....	25.00 @ 28.00,	"
Bessemer Iron.....	18.00 @	"

Included in the sales reported was a lot of 1200 tons Gray Forge, for December delivery, at \$16, cash; 1000 tons Bessemer at \$18, cash, and 900 tons Charcoal, for mill use, at \$19, cash.

Muck Bar.—There is a fair business at unchanged prices, \$28.50 @ \$29, cash. Sales of some 2000 tons reported at \$28.50 @ \$28.75.

Manufactured Iron.—There is a continued steady demand for all kinds of Finished Iron, and the mills generally are pretty well employed, some of them working double time. No change in prices, which, as already stated, are low as compared with cost of Pig Iron. Bars at 1.80¢ @ 1.85¢; Plate, 2.20¢ @ 2.25¢; No. 24 Sheet, 2.85¢ @ 2.90¢. There has been quite an active demand for Sheet Iron for some weeks past, as there usually is at this season of the year. There is no apparent abatement in the demand as yet for Skelp Iron, but there will be within a few weeks, as the Pipe trade commences to fall off the latter part of this month. Grooved is still quoted at 1.85¢ @ 1.90¢, and Sheared at 2.10¢ @ 2.12¢.

Nails.—The Nail trade continues light, and there is but little prospect of any improvement until toward spring. Prices are steady at full card rates, but they are unremunerative; yet trade is so light that it is not likely that there will be any immediate effort made with a view to advancing them. We continue to quote upon a basis of \$1.90 for 12d to 40, 60 days, 2% off for cash.

Ferromanganese.—Sales of 80% Ferromanganese at \$56.50 @ \$57. Sales of Speigel at \$28 @ \$28.50 for 20%.

Wrought-Iron Pipe.—There appears to be no falling off in demand, and prices are reported firm at the advance of last week. Mills generally are running pretty full, but the demand, it is probable, will commence to fall off with the close of this month. Discounts on Black Butt-Welded 52½%; on Galvanized do., 49½%; on Black Lap-Welded, 62½%; on Galvanized do., 52½%; Boiler Tubes, 60% off; 2-inch Tubing, 13¢ per foot net; 5½-inch Casing, 40¢ per foot, net.

Old Rails.—There has been little or no new business in Old Iron Rails during the past week, but while the market is less active prices are still maintained. Consumers are pretty well stocked for the present, but stocks in hands of sellers are not large, and there is no disposition to force sales. We continue to quote American Tees at \$25 @ \$25.25, cash, at which the last sales reported were made.

further advance at present, but full prices are obtained for all orders taken. Buyers continue to request shipments hurried to them, and in many cases stocks are allowed to run so low before orders are given that should any delay occur on account of furnace not having the particular grades when order is received the consumer is put to considerable trouble and expense on account of the delay. Several orders for round lots from desirable customers at full prices have been refused by furnaces this week on account of the delivery being after January 1. With a steady and firm market we quote as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @ \$20.50
Lake Superior Coke, all ore.....	19.75 @ 20.25
Lake Superior Coke, cinder mixed.....	18.50 @ 19.00
Standard Ohio Black Band.....	19.75 @ 20.25
Southern No. 1.....	17.75 @ 18.25
Southern Gray Forge.....	16.25 @ 16.75
Southern Silvery.....	17.00 @ 17.50
Jackson County (Ohio) Silvery.....	18.50 @ 19.00
Old Wheels.....	20.50 @ 21.50

New York.

Office of *The Iron Age*, 66 and 68 Duane street. NEW YORK, October 17, 1888.

American Pig.—The reports of agents and dealers concur quite generally in representing the market to be quiet, but firm. We do not hear of sales of any magnitude, except in the case of one firm, representing Southern furnaces, who have done some business, partly for next year's delivery. It is stated that one of the leading Lehigh companies has an unusually large stock of Low-Grade Irons, but that the quantity of metal of Standard quality that is available is small. We quote: Standard to Choice No. 1, \$18 @ \$19; No. 2 Foundry, \$17 @ \$17.50, and Gray Forge, nominally, \$16 @ \$16.50.

Scotch Pig.—Only small quantities are being sold by importers, who claim that they are rapidly exhausting that part of their supply which they could apply to low freight charters contracted for in the past. We quote: Coltness, \$21.50 @ \$21.75, nominally; Shotts, \$20.75 @ \$21; Langloan, \$21, and Dalmellington, \$20.50 @ \$20.75.

Spiegeleisen and Ferromanganese.—We hear of a sale of 2000 to 3000 tons of 20 % Spiegeleisen to an Eastern mill for delivery January and February, at a price which indicates that the seller is willing to take risks in freights. We quote \$26.50 @ \$27, according to time of delivery. There have been sales of several hundred tons of Ferromanganese at \$54 for foreign, importers now asking \$54.50.

Plates.—We quote Iron Tank, 2.1¢ @ 2.2¢; Shell, 2.3¢ @ 2.4¢; Steel Tank, 2.2¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.65¢ @ 2.75¢, and Fire-box, 3.5¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢.

Steel Rails.—No sales of any consequence are reported by Eastern mills, though it is understood that negotiations are pending for a number of orders and that possibly some of them may have been placed. From the West it is stated that of the Chicago, Burlington and Quincy Railroad order 20,000 tons has been placed with one of the Chicago mills, while 10,000 tons has gone to Pittsburgh. The trade has been much interested during the past week in the interviews attributed to Mr. Carnegie, though his statements that Rails were selling at \$28 at Pittsburgh is somewhat at variance with figures which have been quoted by the firm in that city for some time past. The outlook for Rails is not regarded as very encouraging. Up to the 1st of October, according to the report of the Board of Control, the shipments were 921,863 tons. Last year the ship-

ments up to the same time were 1,390,825 tons. The sales had been 1,838,126 tons, while this year they have been only 1,134,883 tons. Last year the sales for 1887 delivery were nearly as large on the 1st of January of that year as they have been for 1888 delivery on the first of October, 1888. This is beginning to extend into the next year. On the 1st of October, 1888, the total sales for 1889 delivery footed up 40,000 tons. The outlook is therefore far from encouraging, especially when some other features in the railroad situation are taken into account. The developments among the Northwestern roads during the past few months, including such events as the passing of the St. Paul dividend and the reduction of that of the Atchison, together with the report that the Rock Island will build no further extensions—all these circumstances indicate what, for the near future, there may be expected in the way of new mileage by old companies in the Northwest. In some parts of the Southwest the situation is not much better. While it will be conceded that renewals are urgently needed with a good many lines, still even an active demand for that purpose is insufficient to give full and fair employment to our Rail mills unless it was accompanied by a demand for new construction, represented by a minimum of 6000 to 8000 miles of new road. There are a number of inquiries in the market, partly for next year's delivery, among them being one for an Oregon road, for which figuring is going on with Western mills overland, Eastern mills to tidewater and vessel, and English mills. So far as the latter are concerned, they are practically out of the market, since it would cost at least \$48 to put Rails down at the Pacific port, while the domestic, via New York, could be delivered at about \$42. We quote \$28 @ \$28.50 at Eastern mill.

Wire Rods.—The market is quiet, though there is some inquiry for early delivery. For prompt shipment we note a recent sale of 1000 tons at \$39.25 to an Eastern Wire Nail manufacturer. We quote \$39.25 @ \$39. A meeting is to be held at an early date of the German syndicate. It remains to be seen what action it will take in face of the fact that the American market is being rapidly taken away from it by our domestic market.

Old Rails.—Outside of a lot of 1000 tons of Tees taken by an Eastern mill at \$23.50, here, no business of consequence is reported in the market. A large consumer in the Pittsburgh district is reported to have secured some stock in other quarters. While the demand is not entirely filled, East or West, manufacturers are operating very carefully, though it is probable that any decline would bring out some buying. We quote, nominally, \$23.50 for American Tees.

Financial.

The colossal "grain bulge" which has more or less affected all legitimate business in a large measure has subsided, so that, although prices of many staple commodities are unsettled, the tendency is toward a more stable basis. The reaction in wheat and breadstuffs in Chicago was at once manifest in this market, corn following, and day by day fluctuations have been less violent. On Monday there was again a sharp decline, wheat dropping 4¢ @ 4½¢, compared with Saturday. Several large houses were heavy sellers. Spots are heavy at the decline. Breadstuffs were dull, in the absence of demand, either domestic or foreign, the relative high prices on this side keeping exporters out of the market.

The effect of high prices of flour, which advanced here \$2.25 in a month, is shown

in the operations of West India and South American markets, whose trade heretofore has been almost exclusively with this point. Reports are that the West Indies are dickering with Spain for supplies of flour, also that South America is looking to Hungary for shipments by way of Trieste. Estimates made upon the basis of the Government report generally make the yield of winter wheat 276,000,000 bushels, and that of spring 134,000,000 bushels; total, 410,000,000 measured bushels, and equivalent to about 290,000,000 bushels of 60 lb. The Cincinnati *Price Current* estimates the total crop at 270,000,000 bushels of 60 lb. The Government returns for October show that the condition of the present corn crop has been equaled only three times in ten years and is exceeded materially only by that of 1879, when the condition was 98. The present average of condition is 92.

The Stock Exchange markets were generally dull, but strong. The street is now comparatively indifferent respecting the loaning rates of the Bank of England, since the free purchases by the Treasury and the consequent ease in money. A feature was the reaction in Atchison, Topeka and Santa Fé, from the previous rapid decline. New England followed the advance. On Friday stocks were almost stagnant, except for specialties, some of which record sharp advances. On Saturday the tendency was again downward. On Monday Lower prices in London, and the break in wheat induced caution and the market generally fell off. On Tuesday the market opened off and there was a further decline, led by New England, the grangers and the coal shares. Then came an irregular recovery.

Government bonds were weaker for 4s. Quotations are as follows:

U. S. 4½, 1891, registered.....	108½
U. S. 4½, 1891, coupon.....	108½
U. S. 4s, 1907, registered.....	127½
U. S. 4s, 1907, coupon.....	127½
U. S. currency 4s.....	121

Now that the Southern scourge is disappearing, speculation less rampant, and the financial situation improved, the business outlook is encouraging. The movement of freights is of unusual volume, partly in anticipation of the close of navigation. Florida routes, too, are reopened. From Chicago, during the second week in October, the total shipments were 62,000 tons, against 59,100 the previous week and 36,591 tons for the same week last year. The outward movement of cotton and corn will shortly be in large proportions. Cotton in this market is quiet; prices steady. Coffee firmer in a speculative way and teas pretty strong, but sugars are quoted a shade easier for raws. Lard dull and unsettled; trading light. Ocean freights—room for cotton and corn is in urgent demand, with engagements on a liberal scale.

The recent upward tendency in the rates for money was arrested by the acceptance by the Secretary of the Treasury of large amounts of bonds. Money on call averaged about 2½%. The offerings of money on time were liberal, the demand small. Quotations were 4 @ 5½% for four to six months on good collateral. There was only a moderate supply of commercial paper, and rates were 4½ @ 5½% for 60 to 90 days. Simultaneously with the change for the better in the loan market on this side there was an equally pronounced movement in London, where rates settled considerably below the bank figure. The action of the open market in thus refusing to support the Bank of England revives apprehensions of gold shipments. Sterling exchange is quiet at \$4.84½ @ \$4.89.

Acting-Secretary Thompson issued the following: "Notice is hereby given that until otherwise ordered the Secretary will not accept offers of bonds that are held as security for National bank circulation."

The statement that the Department has practically decided to limit future bond purchases to a few millions a month is emphatically denied. There had been no change whatever in the policy of the Department. In the matter of future purchases, the action of the Department will be governed altogether by the "rates at which offers were made and the exigencies of the situation." The total amount of bonds purchased to date under the circular of April is \$84,670,750, of which \$51,392,000 were 4 per cents and \$33,278,750 were 4½ per cents. The cost of these bonds was \$66,005,539 for the 4s and \$35,896,192 for the 4½s, making a total of \$101,901,731. Notwithstanding these heavy payments the Treasury surplus is stated at \$98,000,000.

The gross clearings of 38 cities show an increase of 3.4 % over last year; outside of New York, 10.4 %; New York gained 0.4 %; Boston, 10.6 %; Philadelphia, 5.4 %; Chicago, 17.3 %; St. Louis, 13.2 %; San Francisco, 0.9 %; Baltimore, 14.9 %; Pittsburgh, 17.4 %; Kansas City, 73.1 %; Milwaukee, 11.4 %; St. Paul 11.9 %; Omaha, 37.6 %; Minneapolis, 40.8 %; Denver, 34.5 %; Galveston, 41 %; Detroit, 34.8 %; Cleveland, 2.9 %; Indianapolis, 4.4 %; Hartford, 18.3 %; Peoria, 13.2 %; and Topeka, 87.2 %. Cincinnati decreased 11.7 %, New Orleans, 15.8 %; Louisville, 0.7 %; Providence, 9.7; Columbus, 15.5 %; Wichita, 19.2 %; Duluth, 9.1 %; Norfolk, 0.2 %, and Syracuse 12.3 %.

The weekly bank statement showed unexpectedly a decrease of \$1,102,950 in the surplus reserve, notwithstanding the fact that the Treasury purchased during the week \$19,815,850 of bonds and that the banks thereby gained nearly \$11,000,000 from the Treasury in cash. The reserve now stands at \$10,314,550, against \$11,417,500 last week, \$7,260,200 for the corresponding week in 1887, and about \$4,618,900 in 1886. The heavy drain of currency was principally in aid of the movement of cotton in the South. The demand from the West was hardly as pressing. In loans there was an expansion of \$1,606,800. Specie showed an increase of \$147,100, and legal tenders decreased \$823,300. Deposits increased \$1,707,000, and circulation increased \$1400.

The gross railroad earnings for the month of September make an unfavorable exhibit, due in part to the yellow-fever epidemic in the South, the small movement of cotton and comparison with heavy earnings in 1887. With the improvement in the rate situation, which now bids fair to become general, the movement of the crops, the activity in general trade and the prosperous condition of the coal trade, earnings for the last quarter of the year should materially increase.

The imports of merchandise at this port during the week were large, aggregating \$9,053,900, of which about \$2,500,000 represents dry goods. Total since January 1 \$369,006,000, as compared with \$370,843,000 for the same time last year and \$343,126,000 in 1886. Exports were \$6,769,000, including 700,000 bushels of corn and 30,000 bales of cotton. The exports from all Atlantic ports last week were only 23,285 bushels, and of this 15,000 bushels went from Newport News to Brazil, and of the remainder only one load to the United Kingdom. This is the smallest export business within remembrance.

The exports of specie from this port during the week were \$702,000, and the imports \$111,000; total since January 1 \$29,697,000 and \$6,922,000 respectively, against \$14,250,000 and \$32,965,000 for the corresponding period last year.

Breadstuff exports during September aggregated in value \$11,715,193, against \$11,094,132 in September last year. Cotton exports amounted to 180,214 bales

last month, valued at \$8,814,672, or \$5,000,000 less than in September, 1887. Mineral oil exports during September last aggregated in value \$3,874,719, or about a quarter of a million less than in September, 1887.

The East Side Bank, at the junction of Grand and Division streets, has opened for business. The officers are Thomas R. Manners, president; Samuel B. Clark, vice-president, and James S. Oakley, cashier. It has a capital of \$500,000.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from October 5 to October 12, inclusive, and from January 1 to October 12, inclusive, were as follows:

Iron and Steel.		Oct. 5 to Oct. 12.	Jan. 1 to Oct. 12.
		Tons.	Tons.
Pig Iron: Crocker Bros.....	735	10,007	
W. H. Walbaum & Co.....	304	704

Coal Market.

The usual heavy autumn business having been largely anticipated by the pressure of orders early in the season, the Anthracite Coal trade just now is quiet, except for domestic sizes. Nevertheless deliveries from first hands are in large volume, taxing transportation facilities up to their full limit. No large amount of new business is reported—that is to say, sales at the latest schedule advance are not yet in any considerable amount—but "at one price or another," some of the companies have all they can do, the Reading, for example, being out of the market for the remainder of October, and some of the fancy brands are all sold up on account of the excessive demand. As to prices, it is commonly understood that the maximum has been reached. Broken is weak; the small Stove sizes continue in excessive supply, and Egg is being sold in Philadelphia below the circular. Some solicitude is expressed lest the market become weighted by heavy production. Quotations are as follows: Hard White Ash, Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Fine White Ash, Broken,

\$3.95; Egg, \$4.30; Stove, \$4.65; Chestnut, \$4.55.

Production at the mines shows some increase compared with the previous week, but is below the average for some time past. The total for the week ending October 13 is 836,054, as compared with 693,519 tons for the corresponding week last year; increase, 142,500 tons. Since January 1 the total is 29,308,052 tons, against 26,791,814 for the same time in 1887; increase, about 2,500,000 tons.

The Bituminous Coal trade is active and firm at pool prices, the demand being fully equal to the supply. Respecting efforts to harmonize differences in the Seaboard Association, the Philadelphia *Ledger* says: That while no definite arrangements for a renewal of the association were concluded at the meeting held in that city last week, "the representatives of the several districts present agreed to make no contracts for Soft Coal for delivery next year at any price pending the reorganization of the pool, and until the Beech Creek and other interests can be heard from. Another meeting will be held at an early date, to which, it is expected, all the Soft Coal mining interests east of the Alleghenies, from the Pocahontas district north to the Beech Creek, will send a representative."

The Cumberland region reports a tonnage during the week ending October 6 of 73,959 tons, and for the year 2,727,000 tons, as compared with 2,451,000 tons in 1887. The Clearfield production was 70,000 for the week, and for the year 2,598,000, against 2,451,000 in 1887. The stock of Anthracite Coal at tidewater points on September 29 was 370,811 tons, against 396,752 tons on August 31 and 394,748 tons September 30, 1887.

The Lehigh Valley recently ordered 2000 gondola cars, which will be used partly in the Western Coal-carrying trade. The cars will be built in Catsauqua.

The Western New York and Pennsylvania Railroad has just received 1000 new cars, and directors say 1500 more are needed to handle the company's Coal business into Buffalo. The Jersey Central Road is steadily striving to effect a short and direct route from the Pennsylvania Coal fields to New England by way of the Poughkeepsie Bridge. The long pending suits respecting the possession of valuable Coal lands in Sugar Loaf and Black Creek townships, Pa., between C. M. Derringer and Eckley B. Cox have been settled by mutual concessions. It is said that the concession made an equal division of their interests.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Oct. 17, 1888.

It is stated, on apparently good authority, that the negotiations alluded to last week as pending between the French syndicate and the principal mining companies for the control of supplies for a period of nine years have been suspended. The reason for this is not stated. Speculation in Copper has been very moderate during the week. The syndicate holds prices very steady, but makes no efforts to bring about any advance, probably because of there being no great outstanding "short" interest in the market. Purchases by consumers have been comparatively light.

Speculation in Block Tin has been slow. Supplies here are well under control and the statistical position generally is strong, but buyers are comparatively few and extremely cautious. The market, however,

is looking stronger to-day than at any previous time the last fortnight.

The Pig Iron market has changed slightly for the better, mainly in sympathy with a reaction of 1/ on warrants. Speculation is hesitant at the moment, however, and purchases for consumption and export are barely of average volume. On makers' brands of Scotch Pig there has been only slight fluctuations. Hematites have also been without important change, but Cleveland Pig is a shade higher.

Tin plate has been in limited demand, and the condition of the market is practically the same as it was a week ago. At the quarterly meetings continued firmness in prices was reflected.

Tinned and Stamping Sheets have been advanced a sovereign.

The Trevor Plate Company have started up a second mill.

The Steel trade, as a whole, continues brisk and new orders of considerable size are reported in several branches. Bolckow, Vaughan & Co. have booked orders for 40,000 tons Steel Rails, about one-half of which are for South America. The Glasgow Iron Company have secured an order from the States for 1000 tons, and refused to fill a second order for 1500 tons, except at an advance.

Scotch Pig.—There has been a more active business, without, however, material change in prices.

No. 1 Coltness, f.o.b. Glasgow	49/8
No. 1 Summerlee, " "	51/
No. 1 Gartsherrie, " "	47/3
No. 1 Langloan, " "	48/9

No. 1 Shotts, " at Leith	48/8
No. 1 Glengarnock, " Ardrossan	47/8
No. 1 Dalmeilington, " "	42/6
No. 1 Eglinton, " "	41/6

Steamer freights, Glasgow to New York, 7/ Liverpool to New York, 10/.

Cleveland Pig.—Makers firmer on prices, but business only fair. No. 1 Mid-lesboro', G.M.B., 37/6; No. 3 do., 35/.

Bessemer Pig.—Business has been large and prices show more firmness. West Coast brands, mixed numbers, 44/6, f.o.b. shipping point.

Spiegeleisen.—The demand is fairly active and the market very firm. English 20% quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—There has been a large business and the market is firm. Standard sections quoted at £3. 18/9, f.o.b. at N. W. England shipping point.

Steel Blooms.—Demand continues good and prices remain firm. We quote £4. 2/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—A fairly active business and prices firmer. Bessemer, 2½ x 2½ inch, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—Very little doing, but prices held firmly. Bessemer, £4. 1/3, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—The market and prices unchanged. Mild Steel No. 6 quoted at £5. 19/6 and No. 5 at £5. 18/6, f.o.b. at N. W. England shipping point.

Manufactured Iron.—Bessemer continues brisk. Prices are strong, with an advance on Sheets and Welsh Bars. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars....	£ s. d.	£ s. d.
Common	@ 8	2 6
Staff. Bl'k Sheet, singles.....	@ 5	5 0
Welsh Bars (f.o.b. Wales)....	4 17 6	@ 5 0 0

Tin Plate.—No change of importance in the market. Business fair. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/8 @ 16/
IC Bessemer steel, Coke finish.....	14/3 @ 14/6
IC Siemens	14/6 @ 14/9
IC Coke, B. V. grade.....	14/ @ 14/3
Charcoal Terme, Dean grade.....	12/6 @ 13/

Tin.—The market stronger and more active after ruling duller. Straits quoted at £101. 10/, spot, and £102 @ £102. 10/ for three months' futures.

Old Rails.—Demand rather slow, and the market not so firm. Tees quoted at £2. 17/6, and Double Heads £3, f.o.b.

Scrap Iron.—Moderate sales at barely steady prices. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Crop Ends.—The market quiet and unchanged. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Copper.—Only a moderate business, and no material change in values. Chili Bars, £78. 10/, spot, and £78, three months' futures. Best Selected, £81. 10/.

Lead.—The market quiet and barely steady. Soft Spanish, £14. 7/6.

Spelter.—Demand has slackened and prices are weaker. Silesian, ordinary, £18. 12/6.

Metal Market.

Copper.—London declined with Spot and Chili Bars since our last report from £82 to £78. 10/, and Futures from £78. 10/ to £78; while good Merchantable Brands improved from £77. 5/ to £77. 10/; Best Selected remaining £82. Total London sales, 575 tons. The visible supply in England and France decreased from 89,154 tons on October 1 to 87,233 tons on October 16. The stock of Chili Bars at Liverpool and Swansea is cabled this morning as being 26,857 tons. Import of American Copper into Liverpool and South Wales, 9 months, 19,198 tons, against 8937 in 1887. Our market has been utterly stagnant on the Metal Exchange at nominally 17.40¢ @ 17.45¢ for October. It is now asserted that the syndicate contracts with the mining companies have been renewed, extending them to six years with a small restriction in production, and an advance of ¼¢ in the contract price. The Calumet and Hecla under this extended contract will be limited to 50,000,000 lb p annum. It is stated, to-day, that to restrict production is illegal in this country. Messrs. James Lewis & Son-Liverpool, October, say about good merchantable brands that Chili Bars will soon probably be merged into the former, for forward delivery, so as to prevent the recurrence of a corner in Chili Bars.

Tin.—There has been an improvement in spot Tin in London since we last reported, from £100. 15/ to 101. 12/6, and in futures from £101 to £102. 5/, the sales summing up 580 tons. Our own market has been dull and irregular, total sales not exceeding 90 tons at 23¼¢ spot, and October to December, 22.80¢ to 23.15¢. The improvement in the London market is due, it is stated, to an improving statistical position. **Tin Plates.**—A moderate demand has prevailed for Tin Plates on the spot, with a slight shading on Charcoal finish and Wasters. Futures have been neglected, because they are considered held too high. At Liverpool small lots can be had a little lower, but large lines are held at 18/6 for Cokes. We quote to-day, at the close, for large lines on the spot, Siemens-Martin Steel, Charcoal finish, \$5.20 @ \$5.75; Coke finish, \$4.70; Terns, \$4.25 @ \$4.35; Bessemer Cokes, \$4.50 @ \$4.55, and Wasters, \$4.25.

Lead.—Hardly anything has been done in the open market, and that little on

private terms, the present spot price being 4.80¢. On 'Change altogether 880 tons changed hands. On Thursday the price suddenly dropped to 4.65¢, then rose to 4.97½¢, but subsequently closed at 4.80¢. The Western markets have remained uninfluenced by the weakness here, ruling at 4.90¢ to 5¢. Soft Spanish has been steady in London at £14. 7/6 and English Pig at £14. 12/6. To-day 350 tons were sold, including October up to 4.90¢, November at 4.75¢ and January at 4.25¢. The market closes with 4.62½¢ bid and 4.85¢ asked.

Spelter—Has not displayed much life on the spot, yet Common Domestic continues to be firmly held at 5½¢, while Silesian remains nominally 6¢ @ 6.05¢. London has given way with Silesian from £19 to £18. 12/6.

Antimony.—A firm tone has prevailed, with a fair consumptive demand at 12½¢ @ 12¼¢ for Cookson, and 10¼¢ for Hallett, the latter meanwhile declining in London from £42 to £41.

New York Metal Exchange.

BRAZIL.

PARA, October 12, 1888.—*India Rubber*.—The market remains firmly sustained; there were shipped to New York, so far this month, only 171 tons by one steamer.—*Per cable direct*.

WEST INDIES.

PORT OF SPAIN, TRINIDAD, September 14, 1888.—*Asphaltum*.—There has been a steady, moderate demand, at \$14.04 per ton for boiled, and \$6.84 crude, f.o.b., including export duty. Shipments since January 1 aggregate 40,277 tons, against 31,426 same time last year and 25,885 in 1886. *Exchange*, 90 days, on London, \$4.80 @ \$4.86.—*E. P. Mason*.

CHILI.

VALPARAISO, August 23, 1888.—*Copper*.—Has been so sparingly offered that sales were restricted to 7749 quintals during the fortnight, at \$29.45 @ \$30; \$29.45 equals £75. 10/6, f.o.b., with 27 steam freight. No Copper can be had before the middle of October. *Nitrate*.—There has been an advance from \$2.72½, 95 %, to \$2.87½, \$2.90 being the asking price at the close; sales reached 1,500,000 quintals, of which 1,054,000 were 95 %, and 446,000 96 %; \$2.80 equals 87¼¢ per cwt. and 28/9 freight to England. *Coal*.—The many arrivals of Coal from Newcastle have depressed the market to 32/6, while July sail is held at 35/ in consequence of the rise in freights in England. *Exchange* has been pressed on the market, owing to the large Nitrate shipments, 90 days' on London giving way to 26¼¢.—*Weber & Co*.

EAST INDIES.

PENANG, August 31, 1888.—*Tin*.—The receipts reached 11,000 piculs, of which Europeans took 5000 and Chinese 5000. Opening at \$36 per picul, Tin gave way temporarily to \$34.90, but soon recovered the difference. Since January 1 there have been shipped to England 97,339 piculs, against 102,480 in 1887 and 98,704 in 1886; to the Continent, 338, against 2029 and 1630, and to the United States, 7374, against 13,890 and 32,798. *Exchange*, 4 months' bank, 3/1½.—*Schmidt, Kustermann & Co*.

MANILA, October 8, 1888.—*Hemp*.—At \$10.62½ per picul there continue buyers, against \$9 same time last year, equaling respectively per ton, cost and freight, £35. 17/6 and £32. 10/. Clearances for the United States since last cable amounted to 5000 bales, against 17,000 in 1887; since January 1 they reach 152,000, against 171,000; there remain loading for that destination 47,000, against 51,000. Cleared for England since January 1, 261,000 bales, against 162,000; loading for do., 5000, against 6000; cleared for all other ports, 57,000, against 30,000; receipts at all ports since last cable, 13,000, against 11,000, and since January 1, 482,000, against 391,000 and 311,000. *Freight*, \$6, against \$5, and *Exchange*, six months' sight drafts, 3/6, against 3/5½.—*Ker & Co*, to Charles Nordhaus, 89 Water street, New York.

HOLLAND.

ROTTERDAM, October 3, 1888.—*Copper*.—In accordance with the plan of reorganization submitted to the shareholders at the recent general meeting, the Peninsular Copper Company have been remodeled and a new company formed called the Consolidated Peninsular Copper Company, to be domiciled at Amsterdam, with a share capital of 7,000,000 guilders, 16,667 shares of 240 guilders and 25,000 at 120, to be offered for sale in Amsterdam, London, Paris and Berlin. *Tin*.—Following are the Netherlands statistics for September:

GERMANY.

HAMBURG, October 6, 1888.—*Iron*.—There has been a growing inquiry in Rhenish-Westphalia during the week for both Pig and Finished, giving rise to the impression that the paralysis is at an end. Several large orders for Spiegel have been executed for American account, one for 20 % Manganese for 10,000 tons, and one for 10 to 12 % for 5000 tons; negotiations are going on for additional lines for the same quarter. Although these Spiegel shipments to the United States do not yet come up to what they were in 1887, a continuation of them would probably cause an improvement. For the moment 10 to 12 % does not bring over 53. But for Luxembourg underselling German makers, other Pig Iron would be higher and brisier than it is. Siegen is selling Forge Pig at 47 @ 48. Foundry Pig has remained steady, and so have both Bessemer and Thomas; the latter more and more supersedes Bessemer. White Luxembourg may be quoted 37.50; Gray, 42; English, 42. The domestic demand for Finished is decidedly livelier, but there is no stir in the export trade. Hoop Iron sells with greater ease in the home market; Beams continue lively, and so do Boiler Plates; Thin Sheets are doing better. Steel works are busy throughout, and so are the Car works; the Wire branch is quiet and steady. The quotation for Merchant is 125 @ 127.50; Bessemer Steel Billets, 135; Steel Rails, 120; do. for mines, 115. Prospects for a renewal of the International Steel Rail Syndicate are the reverse of encouraging just at present. In Upper Silesia 28 furnaces are in blast, 23 for own use

and 5 operating for the general market, the weekly output being 8500 tons. Works generally are loaded down with orders, so that all Iron branches are in a flourishing condition, the chief demand for the export of Finished coming from Roumania, Bulgaria, Servia and Denmark. There are even orders from Russia. The demand extends to Wire Nails, owing to the activity in the building branch this fall. *Metals*.—Lead continues tending upward, Hartz Lead bringing 15 marks in this city. Both Copper and Spelter remain firm.—*Bor-senhalle*.

The Electric Light in the Navy.

The electric light has been very prominent during the recent British naval maneuvers, and although accounts somewhat differ as to its actual value, there can be no doubt that it is one of the indispensable adjuncts to a modern man-of-war. One of the English electrical journals, while on this subject, remarks that some complaints have been made that the lookout men are so dazzled by the beam that they are unable to keep as sharp a watch as is necessary in directions which are not at the moment illuminated. On the other hand, this dazzling effect was turned to a good use during the naval maneuvers of last year, when the gunners manning the guns in the Pembroke Dock forts were rendered almost blind every now and again by the attacking ships skillfully flashing the light full in their faces, and during the interval of darkness moving rapidly to another point. This year Admiral Tryon made clever use of the electric light in a manner which recalls a somewhat similar use made by the French in their attack on Sfax. Unable to approach the forts near enough to deliver an effective fire, the French admiral placed his Hotchkiss quick-firing shell-guns on board his small boats, and as soon as it was dark sent them to attack the enemy at close quarters. He then threw the strongest possible light upon the forts, and the small boats, moving ahead in the darkness just beyond the flashes of light, came in close to the forts and poured in a deadly fire. The defenders, completely bewildered, capitulated soon after daylight.

A Hydrostatic Balance.—A hydrostatic balance, invented by Mr. John Joly, was exhibited at the recent meeting of the British Association. In a case about a foot high there is suspended a brass ball containing water, inside which floats a smaller ball. From this latter a wire passes through a nozzle in the outer vessel down to two scale pans, arranged one above the other. One scale pan would, of course, suffice. The balance weighs any quantity up to 164 grams accurately to within 1 or 2 mg. It can be made very cheaply and is independent of temperature and consequent expansion unless water be placed in the ball and air admitted. To prevent this a small chamber is placed round the nozzle through which the wire passes, into which dips a little stem from the sphere. This arrangement resembles a U with one very narrow and one wide limb, the latter one corresponding to the orifice in the vessel through which the wire passes, and the displacement would first occur in the finer tube. The surface tension of the liquid prevents any direct leakage of water. If perfect compensation be aimed at the outside vessel might be made of tin, the inside of iron. The hope was expressed that accurate and large balances will be made at a very small cost on this principle.

Engineering News has just published the first of a series of statistical reports on the water works of the United States, beginning with New England. The States in that group have 287 water works, with 5291 miles of mains, the capital invested being \$84,993,000.

Hardware.

There is little change in the situation, prices remaining without alteration and the demand being fair. The complaints that trade is in a measure disappointing are made in some quarters, but the volume of business is generally regarded as pretty satisfactory.

Barb Wire.

The market is not characterized by special strength, and business is moderate in volume. Carload lots of Four-Point Galvanized are quoted here at 3.6 cents, with the usual advance for small lots.

Cut Nails.

The market is quiet, with a moderate amount of business doing. Prices continue unchanged at \$1.85 for carload lots of Iron Nails on dock, and \$1.90 @ \$1.95 for small lots from store.

Wire Nails.

The condition of the market in this line is regarded as exceptionally satisfactory, the Western Association having completed its organization, with provisions to secure the maintenance of prices, and including as it now does all the leading Western manufacturers. At the meeting of the Eastern Association, held last week, the matter of an advance in prices was broached and suggested to the Western Association, but the result of the action remains to be seen. Quotations remain \$2.55 for carload lots and \$2.65 for small lots, and those quotations are held with regularity, except that in a few instances slight concessions are made beyond the prices given for small lots. The exceptionally large stocks of Nails held by the trade have some influence in the market, as the Nails can in many cases be bought from second hands at lower figures than from the manufacturers.

Miscellaneous Prices.

The price of both Manila and Sisal Rope remains without change. The fact that the Hemp of both kinds is firm in price gives a strength to the manufactured product, and it is thought not unlikely that an advance will soon be made.

The prices for Market Wire remain unchanged except that some exceptionally low quotations are no longer within the reach of buyers. The demand is referred to as light.

W. G. Avery Mfg. Company, Cleveland, Ohio, quote their Combined Saw-Set and Punch, their Bevel and Square and their Bevel Protractor Square at discount 40 per cent.

Trade Topics.

From a well-known Hardwareman in Texas we have the following incident, which was suggested by a recent article in this paper:

Referring to the article in your issue, 27th of September, on the art of selling, it reminded me that one time I was selling a small boy a 10-cent Pocket Knife. I was alone in the store at the time, when a man came in and wanted to buy a Wagon worth \$80. I invited him to take a seat until I was through with the boy. He remarked that if I would not drop a 10-cent sale to sell him a Wagon he would go elsewhere. I called his attention to the fact that at one time he was a small boy, and probably a 10-cent Knife was as much to him then as the Wagon now. He quickly and quietly took a seat until the boy bought the Knife and was gone. I was then at his service, and in a short time sold him the Wagon, and he left in a happy mood.

Our advices from Louisville, under date of the 13th inst., are as follows:

The Hardware trade of Louisville, Ky., has been good but quiet, a fair volume having been transacted. The Southern trade is still terribly depressed, with a few straggling orders coming from the unfortunate sections. Many salesmen have gone into the Southwest with

the idea of working back through the infected districts after frost makes its appearance. Bar Iron is in fair demand and holding firm at \$1.75 from store. Light Sheet is very scarce and sells readily at \$3.50 for No. 27 in jobbing lots. This advance is caused by the inability of the mills to fill orders. No one would have supposed that there were too few Sheet mills in the country, but such seems to be the case. For No. 27 there never was such a pressing demand on the jobbers, who, in turn, are urgent for prompt shipments from the mills, yet meeting with very little success; stocks are almost completely exhausted. Wire Nails are holding firm, a new advance having been ordered by the association. Dealers are getting suspicious of the danger line being reached, and a break resulting. The demand, although fair, will not stand much further tension. Cut Nails have again dropped. The action of the mills in association does more harm than good; they meet and resolve to sell only at certain prices and entice dealers to buy heavily, when down drops the bottom, and all confidence is destroyed. History repeats itself very fast in this instance. The Axle manufacturers have resolved that orders are getting scarce, and are throwing out fresh inducements to their friends, the big jobbers.

Items.

Freeman Wire Company, St. Louis, Mo., have in the hands of the printer a handsome catalogue, which will contain copious illustrations of the different styles of specialties which they are manufacturing.

Wells Bros. & Co., Greenfield, Mass., issue a supplement to their catalogue, in which descriptions are given of their Little Giant Combined Drill Holder and Countersink, their Farriers' Tool Box and Vise Bolt Grip and Wheel-Holding Attachment.

The Phoenix Wire Works, Detroit, Mich., are issuing their autumn catalogue, which shows a varied line of Counter and Office Railings, Iron Crestings or Roof Railings, Wire-Cloth Flower Stands, Screens, Nettings and miscellaneous goods.

The Meriam & Morgan Paraffine Company, Cleveland, Ohio, issue a price list relating to their manufactures, including, among other things, the Paragon Axle Grease.

By the special notice on page 51 it will be seen that Haydock & Bissell will sell at auction at the store, No. 86 John street, New York, the entire stock of the Benton & King Company on Wednesday and Thursday of next week. The sale will comprise in part an assortment of machinists' Bolts and Nuts, Brass Valves, Steam and Service Cocks, Gas Fitters' Tools, &c., and general Engineer's Supplies. Further particulars may be learned from the advertisement.

The Goulds Mfg. Company, Seneca Falls, N. Y., announce that Chaales L. Zacharie, who has been with them for many years, will hereafter be associated in the management of their salesroom at 60 Barclay street, New York.

Horton Mfg. Company, Fort Wayne, Ind., issue an effective advertising hanger, illustrating their Western Washer in attractive style.

Dightson & Co., wholesale and retail hardware merchants, at West Superior, Wis., are reported to have made an assignment for the benefit of their creditors on the 11th inst. Their assets are reported at \$20,000 and liabilities at \$35,000. Among their creditors are firms at Chicago, Milwaukee and Detroit.

In calling attention to their Standard Reference Disks the Brown & Sharpe Mfg. Company, Providence, R. I., send out not only a circular in which the goods are described and prices given, but they also issue a miniature pamphlet in which the characteristics and advantages of the Standard Reference Disks are pointed out. These pamphlets are evidently intended for distribution among mechanics who have use for the goods, and we call special attention to this method of bringing them

to their attention, as it may suggest to other manufacturers the adoption of similar expedient. We reproduce below one of the pages full size:

When a Gauge or Caliper has been long in use, the question arises whether constant service has impaired its accuracy. In deciding this question, Standard Reference Disks are of use. They are also useful for other

It will be conceded that the use of such advertising matter tastefully and judiciously gotten up and well distributed, would be an important aid to the retail merchants in effecting sales for Hardware. In cases where this simple expedient is resorted to it has been, we believe, attended with the best success.

Our readers will observe the advertisement of the Henry C. Hart Mfg. Company, Detroit, Mich., page 52, referring to their specialties for the Toy trade, including a line of Toy Banks, one of which is illustrated and the names of others given. All of these Banks are stated to have Combination Locks except the Cash Register Bank, of which we recently gave a description.

Brooklyn Wire Nail Company, 17 Broadway, New York, have prepared a unique and interesting Lead Pencil, which they are sending out to their customers. It is in the form of a finely finished 20-penny Wire Nail.

The Harrington & King Perforating Company, 224 and 226 North Union street, Chicago, received a letter on the 13th inst., mailed on the 1st of August, from a correspondent in Loeboc Samperie, Padang, Sumatra, West, Dutch East Indies, giving them quite a large order for perforated metals for separating coffee. The correspondent also ordered some general coffee machinery and a number of articles in the line of general hardware. He stated that he had seen the advertisements of these articles in *The Iron Age*, to which he was also indebted for much information about machinery. The letter also said that the planters of that district preferred to patronize American manufacturers, finding them usually very reliable and their goods and machinery of high quality, which could not be said for the manufacturers of other countries. In shipping these goods the route followed is via New York, Amsterdam, and the Suez Canal, by the Netherland Steamship Company. The Harrington & King Perforating Company inform us that they have a very large foreign trade in their perforated metals, which is traceable to a considerable extent to their advertisements in *The Iron Age*.

Result of the Cipher Competition.

There were 91 lists of ten-letter words received in the David Williams cipher competition. Of these 88 were received before the hour fixed for closing the contest, while 3 were received after that hour. The longest list was sent in by C. F. Rood, of Grand Rapids, Mich., aggregating by actual count 1158 words. This was reduced by the Committee of Award to 1065. The second longest list came from A. Israel, of Buffalo, N. Y., being by count 1146 words, which the scrutiny of the committee reduced to 996. The third list came from Sam Holder, of Bloomington, Ill., counting 1082 words, but being similarly reduced by the examination of the Committee to 974 words.

The prizes, therefore, by the terms of the contest go as follows: First prize, \$15, to C. F. Rood, of Grand Rapids, Mich.; second prize, \$10, to A. Israel, of Buffalo, N. Y. In view of the close competition between the last two competitors named, it has been decided to add another prize, and therefore the third prize of \$10 is awarded to Sam Holder, of Bloomington, Ill.

The three contestants named above, as will be seen by the list published below, distanced all their competitors, the next highest lists being in the eight hundreds. In the list of contestants we indicate the order in which the papers were opened by the committee, and append the number of words sent in by each, by actual count. It will be noticed that the number of lists ranging from 500 to 700 words is far the larger number. This, we think, will be a surprise to the reader, for very few, we imagine, who have not given personal examination to the subject, would suppose there were even 300 words of the kind specified in the contest. A number of ladies, wives and daughters of subscribers took part in the contest. The geographical distribution of the names, it will be observed, is very general, a very large proportion of the United States being covered, as well as Canada. The following is the list of names and addresses of the competitors, initials or *nom de plumes* being inserted in cases where we have been requested not to publish the names:

LIST OF CIPHER COMPETITORS.

1 "C. S. C.," Oakdale, Neb.....	823
2 J. H. Robbins, Keokuk, Iowa.....	667
3 A. Israel, Buffalo, N. Y.....	1146

Recent Exports.

PER SHIP ELBE, SEPTEMBER 28, 1888, for MELBOURNE, AUSTRALIA.

By Woodhouse & Stortz.—12 cases Hardware, 8 Stoves, 526 pounds Shade Rollers.
By Hsley, Doubleday & Co.—33 1/2 gross Axle Grease.
By S. H. Payne.—3500 pounds Plated Ware.
By Lazarus & Rosenfield.—20 cases Clocks.
By F. Kroeber Clock Company.—1 box Clocks.
By Arnold, Cheney & Co.—12 cases Iron Castings, 4 cases Forks, 7 cases Axles, 20 cases Children's Wagons, 4 cases Spokes, 2 cases Spokes, 4400 pounds Axles, 2 cases Plows.
By Healy & Earl.—6 packages Forges, 17 cases Woodworking Machinery, 2 Iron Safes, 10 packages Forges, 2 cases Saw Mills, 1 box Belt Hooks, 1 case Woodworking Machinery, 3 cases Sandpaper.
By Rand Drill Company.—1120 pounds Drills, 5910 pounds Air Compressor and Parts.
By H. W. Peabody & Co.—44,800 pounds Barb Wire.
By Arkell & Douglas.—3 dozen Razors, 10 dozen Axes, 6 dozen Shovels, 6 crates Traps, 3 dozen Toys, 1 dozen Wringers, 7 dozen Roller Skates, 5 dozen Wall Brackets, 5 1/2 gross Fruit Jars, 9 dozen Hammers, 1 gross Glue, 4 dozen Planes, 20 1/2 dozen Saws, 3 dozen pairs Roller Skates, 601 pounds Brackets, 975 pounds Hardware.
By R. W. Forbes & Son.—10 dozen Axes, 14 packages Hardware, 31 packages Hardware, 3 dozen Fork Handles, 25 1/2 dozen Axes, 26 packages Hardware, 1/2 dozen Hardware, 998 pounds Carriage Bolts, 30 packages Hardware, 24 dozen Hatchets, 36 dozen Sledge Handles, 6 packages Plated-ware, 3180 pounds Carriage Bolts, 5 dozen Wringers, 6 dozen Egg Beaters, 23 packages Stoves, 1 case Hardware, 33 Bolt Clippers, 24 dozen Axes, 1 dozen Hay Knives, 8 dozen Wringers, 16 packages Stoves, 1200 Carriage Bolts, 3 sets Wheels, 8 boxes Hardware, 143 pounds Rivets, 1 case Bicycles, 280 pounds Nails.
By Coombs, Crosby & Eddy.—42 dozen Edge Tools, 1500 Bolts, 20 dozen Handles, 21 dozen Edge Tools, 10 dozen Hardware, 2 gross Glue, 5 gross Tools, 25 dozen Hardware, 1 gross Clothes Pins, 500 Broom Handles, 3 dozen Handles, 3 Pumps, 168 pounds Nails, 3 Meat Presses, 4 Lamps, 3 dozen Traps, 29 dozen House-Furnishing Goods.
By W. H. Crossman & Bro.—12 dozen Curry Combs, 1/2 dozen Sausage Stuffers, 1 1/2 dozen Wagon Jacks, 13 dozen Scroll Saws, 20 dozen Washboards, 22 dozen Wrenches, 3 dozen Tills, 1-6 dozen Store Trucks, 41 dozen Meat Cutters, 5 1-6 dozen Bird Cages, 1 dozen Wood Scoops, 3 dozen Churns, 12 dozen Mouse Traps, 12 dozen Vises, 3 dozen Scroll Saws, 6 dozen Bench Screws, 1 dozen Oil Stoves, 5 gross Blacking, 1 dozen Sinks, 24 1/2 dozen Pulley Blocks, 4 1/2 gross Axle Grease, 3360 pounds Axle Grease, 2900 pounds Nails, 5000 Paper Shells, 11 cases Cartridges, 292 pairs Roller Skates, 1 Crate Washers, 11,200 pounds Barb Wire, 18 dozen Razor Strops, 43 dozen Axes, 30 dozen Hatchets, 12 cases Carpenters' Tools, 7 cases Hardware, 32 packages Hardware, 54 dozen Handles, 1750 feet Chain, 7 packages Pumps, 3 dozen Wrenches, 1006 pounds Packing, 66 packages Carriage Hardware, 30 dozen Axes, 1/2 dozen Folding Beds, 1 case Hardware, 14 dozen Picks, 8 dozen Axes, 1/2 dozen

Washers, 20 dozen Axes, 1½ dozen Wringers, 40 boxes Clothes Pins, 52 Axes, 12 dozen Hatchets, 30 dozen Shovels, ½ dozen Mangles, 1 case Tools, 1803 pounds Hardware, 1 crate Washers, 4 packages Tools, 43 dozen Wrenches.

By *H. W. Peabody & Co.*—10 packages Agricultural Implements, 14 packages Typewriters, 15,000 pounds Handles, 72,000 feet fuse, 62 packages Grease.

By *H. Behr & Co.*—4 cases Sandpaper.

By *Strong & Trowbridge.*—9 cases Cartridges and Shells.

By *Welsh & Lea.*—26 cases Hardware, 4 cases Saws.

By *Meriden Britannia Company.*—18 packages Plated-Ware.

By *Morris, Strouse & Co.*—21 dozen Hand-saws, 10 dozen Plumbs and Levels, 6 gross Forks, 1 gross Mop Sticks, 45 dozen Mouse Traps, 3 gross Tools, 48 dozen Gate Hinges, 2 gross Liquid Glue, 24 dozen Hammers, 18 gross Hat and Coat Hooks, 3 gross Sad Irons.

By *Seth Thomas Clock Company.*—65 boxes Clocks.

By *A. S. Lascelles & Co.*—100 cases Slates, 10 cases Handles.

By *S. Halsey & Son.*—110 pounds Hardware.

By *Thompson, Bedford & Co.*—1 case Plated-Ware.

By *Strong & Trowbridge.*—3 cases Carriage Hardware, 5 cases Broom Handles, 30 dozen Axes.

By *Ansonia Clock Company.*—66 boxes Clocks.

By *W. K. Freeman.*—242 pounds Horse Nails, 6 boxes Hardware.

By *R. Irwin & Co.*—2 cases Hardware.

By *A. Field & Co.*—24 dozen Carriage Ironwork, 9000 pounds Tire Bolts, 3 cases Carriage Ironwork, 45 Axes, 6 sets Axes, 16 sets Wheels, 450 dozen Whip Handles, 40 dozen Harness Trimmings.

By *Crane & McMahon.*—20 cases Carriage Ware, 101 packages Carriage Ware, 25 cases Carriage Ware.

By *E. Miller & Co.*—19 boxes Lamp Goods, 4 packages Lamp Goods.

By *Welsh & Lea.*—5 cases Iron Bolts, 50 boxes Clothes Pins, 9 packages Hardware, 5 cases Shovels.

By *Russell & Erwin Mfg. Company.*—5 cases Hardware.

By *McLean Bros. & Rigg.*—1900 pounds Nails, 160,000 Rivets, 20 dozen Axes, 26 dozen Brackets, 19 dozen Clocks, 4 dozen Lamp-ware, 9 boxes Castings, 5 cases Tacks, 2 crates Tills, 56 pounds Oil Stones, 24 dozen Fly Traps, 18 dozen Scales, 34 dozen Saw Sets, 24 Vises, 24 dozen Hammers, 2 dozen Grindstones, 12 dozen Braces, 10 Bench Screws, &c., 31 Stoves, 13½ dozen Shoe Brushes, 895 Staves, 101 dozen Sporting Goods, 3 dozen Pick Handles, 3 dozen Mop Heads, 84 dozen Axe Handles.

By *W. R. Cameron & Co.*—5 cases Sand Paper, 1 case Machinery, 21 cases Iron Bolts, 14 cases Meat Choppers, 125 cases Axes, 2 cases Bolts, 21 cases Castings, 5 cases Springs, 14 cases Bolts, 83 cases Handles, 1 box Castings, 2 cases Sand Paper, 1 case Hardware, 2 cases Hat Racks, 1 case Grease, 5 cases Hardware, 2 cases Wagons, 48 cases Trucks, 1 case Brushes, 6 bundles Handles, 5 cases Wheels, 1 box Children's Wagons, 3 cases Hardware, 9 cases Wagons, 39 cases Shoe Nails, 1 case Tools, 5 cases Blacking, 20 barrels Blacking, 1 case Shoe Knives, 104 cases Handles, 110,000 pieces Slate, 21 dozen Shovels, 35 cases Edge Tools, 7 cases Shovels.

American Hardware in the Australasian Colonies.

The following is a continuation of the article in the Australasian *Ironmonger*, from which we gave an extract in our last issue. It is of interest as relating to the position held by American Hardware in the Australasian Colonies:

NEW ZEALAND.

General Hardware.—The Lock trade, in which America had the run of this market for cheap Locks, has, to a large extent, failed them recently, owing to English makers bringing out Locks in wrought metal as cheap as the American in cast. This result has, however, been attained by English makers, to a large extent, copying American patterns and style. The packing of the American Lock, however, still remains superior. In light castings Kenricks have taken a large portion of the trade the Americans once had. In light edge tools the Yankee is not holding his own; the English makers have improved the finish of their tools and are quoting lower prices. In carpenters' Braces, special wood-working tools, and carpenters' Hammers, however, the American makers are quite holding their own. In Axes, also, the American is pre-eminent; nothing can touch the productions of the Douglas Axe Company, or those of the Francis Axe

Company. Oliver Ames Corporation also sweeps the board nearly so far as Shovels are concerned, although Sheffield is and probably will increasingly push into a share of this trade. In Lamps America is again coming to the front, especially in force draft and circular wick with central draft. In Electro-Plated Ware American travelers are offering patterns which come nearer to English ideas of chaste beauty, and there still continues to be a fair demand for the showy striking designs they have for some time been noted for. In Hay Forks the English makers are picking up more of the American ideas, and are putting them in at cheap rates. In all kinds of Handles, however, the American timber has all its own way. Barb Wire is nearly out of the market; a little of Johnstone, however, is coming forward, but the freight kills it. In Cotton Duck, until recently, all has come from America, but recently Heavy Cotton Duck and Canvas have been obtained from England at prices slightly over the American, but the quality is improving every shipment. In Kerosene, Turps., Rosin, none but American is on this market. Although outside the trade it might be mentioned that large quantities of Sausage Casings and Clover Seeds are imported from America.

In the ironmonger's trade it is estimated that American goods represent from 15 to 20 per cent. of the whole. The following are, at all events, the principal items in this line: Axes, Picks, Shovels (no Spades), Hay Rakes, Hay Forks, Scythe-Handles (but few, if any Scythes), Garden Rakes and Hoes, Wash-boards, Tubs, Hammers and Chisels (a few, but the bulk come from England), Locks, Scales and Weighing Machines, Stoves. Of Saws, the Hand-Saws are mostly from America, and Circular Saws chiefly from England. Then there are Churns, Carriage Woodware, Barb Wire, Smallware (such as Apple Parers, Egg-Beaters, &c.), Lawn Mowers. In Agricultural Machinery, Hornsby's Reapers and Binders take the lead, and the Buckeye Mowing Machines and Reapers and Binders are also favorites.

We have on a former occasion remarked upon American garden tools, such as Rakes, Hoes and Lawn Mowers, as being much lighter and better balanced than the old English types, and the same thing may be said of other similar goods. The representatives of English manufacturers are beginning to visit these colonies more frequently than they used to do, and they can easily ascertain and judge for themselves the extent of trade which they are likely to lose. Every year these markets will be extending in importance and British manufacturers can easily, if they think it worth while, retain the trade, as some importing houses find it easier, through their more settled connections and channels, to obtain goods from England than from America. An effective effort in this direction has already been made by certain Lock-makers, with satisfactory results.

Boring Implements, which include a large variety of tools, are well supplied by several firms. In this respect perhaps the Millers Falls Company deserve first place for "Barber" Bit Braces, Ratchet Braces, Breast Drills, &c.; then comes W. A. Ives, for excellence in Hollow Augers, Expansion Center Bits, &c. Cook's Auger Bits are being favorably known, but have had to give place latterly to Gilpin's English make. For jobbers' and machinists' Drills the Morse Twist-Drill Machine Company stand high.

Chisels, Gouges, &c.—For a long time the American Socket and Socket-Firmer Chisels and Gouges held a high place in the esteem of the colonial workmen, but for some reason the sale, to a great extent, has fallen off, and the English makers still hold sway in this line.

Forks.—When Sluice Forks were largely required the names of Sheble & Fisher and Tuttle were to the miner guarantees of a good article, but hydraulic sluicing has driven this tool from the market. American Hay, Manure and Spading Forks hold their own against English manufacturers, though the Hay Forks are in danger of being squeezed out by the great English makers.

Hammers.—In all kinds of bench and artisans' Hammers the Henry Cheney Hammer Company were the first to present us with a perfect article, and they have deservedly obtained a large trade. They still hold the position, but the English makers, Spear & Jackson, are treading fast on their heels.

Hones.—All the finer kinds of stone used for sharpening good tools are supplied from America, among which are Arkansas, Washita, Indian Ponds, &c.

Planes.—We have to thank the Stanley Rule and Level Company for the introduction of these combinations known as Iron Block Planes, the Bailey Adjustable Plow, &c.

Picks.—Some 15 or 20 years ago it was almost impossible to sell any other than a Collins' Pick. At the present time it is difficult to

get cost price for them. They have been superseded by several English makers, notably Edwards, Holt, Richards. The principal reason for this is to be found in the pattern; English makers put more strength in theirs.

Plumbs and Levels of all styles and sizes for the use of carpenters, bricklayers, engineers, surveyors and others, this company's goods are ahead.

Saws.—Among American makers in this line Henry Diston & Sons, Keystone Works, Philadelphia, stand pre-eminent. From the list of Hand Saws we select Nos. 7, 76 and D8 as being the most popular: from Cross-cuts, the Great American and Drag-Tooth. In Mill Saws the English makers, Wheatman & Smith and Spear & Jackson, dispute the ground, especially the latter, whose make is said to be very reliable.

Shovels.—Of long standing in the public estimation, especially in that of contractors, mining companies, &c., is the Shovel known as O. Ames. No tool has had so firm a hold of the market, and retained it for such a period, as Ames' No. 3 L.H.R.P. Shovel, and in saying this we may be quite sure it is because it has been the best. Both the miner and contractor have long ago indorsed that verdict. When it comes to a D or Crutch-Handle Shovel (the latter is seldom used), the Americans are out of it. In coal mines and on railways the English maker gets a chance.

Spades.—The American article has never taken anything like first place in this market, being too light and flimsy for a new country, where stumps and roots are so frequently encountered; the English make are much stronger.

Locks.—So many new departures from the old stereotyped form and patterns of the Old World have been taken by the Americans that it is difficult to say which is the most startling; but certainly the Lock trade in that country has grown into an industry marked by astonishing novelty and ingenuity, and in the building up of this trade light castings have been a surprising factor, enabling the maker to place a neat, handy and cleverly constructed Lock on the market at prices never heard of. The best-known makers here are the Russell & Erwin Mfg. Co. and Sargent & Co. for House Locks, and the Yale Mfg. Company for the finer kinds.

Nails.—Time was when we obtained from America the bulk of the Cut Nails we built our wooden houses with, but that is a long time ago. The Wire Nails from the Continent of Europe have squeezed them out; we still import from there some lighter kinds, such as Finishing Brads, Hungarian Boot Nails, &c., while American Horse Nails have entirely obliterated the English and Scotch makes, and the Putnam Horse Nail is a "household word" in every smith's shop in the colony.

Castings.—The thousands of uses that Light Iron Castings have been put to by the American manufacturers are a monument of their ability, ingenuity and skill. In this department America stands unrivalled. It would be quite useless to attempt to enumerate the goods made in this way, and for the same reason we can only mention a few manufacturers in this line. The most important industry under this heading, perhaps, is cooking and heating Stoves; the elegance of design arrived at by some makers is astonishing, when we take into account that utility must not only be preserved, but made more and more perfect. The highest class Stoves are seldom seen in this colony, because in our towns we mostly use English cooking Ranges, which are built in as fixtures.

Machinery.—In harvesting and field requirements the Reaper and Binder has played by far the most prominent part with us among American productions, the other leading lines calling for mention being few. Horse Rakes are perhaps the next in importance, and of these the Taylor and the Buckeye are best known. In Flows, the American-made that have come to hand are limited in number and not suitable. The English makers provided these for many years, but for a long time past colonial-made Flows have, in a great measure, put the imported ones out of the market. Lightning Hay Knives and American Scythe Snaths should here be noticed, especially the latter, as having completely superseded those crude, unhandy articles that English makers dispatched to the colonies in the early days of colonial history. In this connection, for small holdings and garden cultivation, the Planet Junior farm and garden implements are superseding the ordinary hand implements; their combined Drill Cultivator and Plow is a really useful line, as is also their No. 2 Seed Drill, and we may fairly look for a rapid extension of their use. This brings us to a notice of Lawn Mowers, the makers of which have been many and various. Among those the Philadelphia, the Excelsior and New Easy are the best in this market. Corn Shellers, among farm requi-

sites, should not be forgotten, although they have been patronized more, perhaps, by our Maori population than by the whites. Ames Plow Company are the most favored makers in this line, as also in Hand Corn Mills and Thermometer and other Butter Churns. There are very few dairies in this country where these goods are not well known and highly appreciated.

VICTORIA.

As the result of inquiries as to what extent American manufactures are being successfully introduced into this colony, I find that in some lines American manufacturers and merchants are pushing their trade in articles in which England formerly was supposed to excel beyond fear of competition. This applies more especially to Stoves, Locks, Lock Furniture, Bolts, Cutlery and Steelware; Axes are almost an American monopoly, as also Buggy and Wagon Woodware and Iron Fittings. Braces and Bits, Hammers, Joiners' Tools, and a large variety of Shelf Goods are also well stocked here.

The English wares are not being ousted because the American manufactures are in all cases better, but because the latter are, as a rule, pushed with more energy, system, and local adaptability. English manufacturers in the past have not been in the habit of studying the changes in the requirements of the market as their competitors have done, though lately there are signs that many makers are awakening both to their own interest and to the fact that the colonies require well-finished, low-priced, and suitable articles.

In *Electro-Plated Ware and Britannia Metal Goods* the Meriden Britannia Company, Reed & Barton, and Simpson, Hall, Miller & Co. are the principal firms doing business here. A good trade has lately been done by these firms in low-priced Cruets, Tea Sets, Spoons and Forks, Cake Baskets, Ice Pitchers, Card Receivers, Pickle Castors, &c., all of which are in good demand and meet with a ready sale.

In *Tools* an immense number of American firms are competing for a share of our imports. Among *Edge Tools* the American *Axe* is

Fig. 280.—Elevator Guides.

almost a monopoly in this market; the principal makers are the Douglas Axe Mfg. Company. General shelf goods, such as Locks, Butt Hinges, Flush Bolts and Rings, Barrel Bolts, Letter-Box Plates, Door Bell Handles, Sash Fasteners, Sheaves, Pulleys, Brackets, Lock Furniture and general Hardware, are largely imported, and in some lines, especially in Locks, are quite superseding English makers, as far as extensive sales are concerned. The American Lock commands the market through being lower-priced and more attractive, although where price is a secondary object for really first-class buildings the English make is generally adopted.

Cutlery.—The efforts made by American manufacturers of Cutlery to open a market here have been few and far between, and sufficient energy has not been shown in pushing a trade. Finding the competition very great in this class of goods, and not by any means an easy job to have it all their own way, they have neglected this for other markets, where a larger business can be done and better profits realized. An exception to the above is to be found in Butchers' Knives, which are highly appreciated and have a good sale. Razor Strops of all kinds are imported.

Stoves, Ranges, &c., have been well pushed here, Stoves especially being well stocked, but Ranges, perhaps because they are more distinctly English, are more scarce. The competition in this line has been very keen, with the result that some surprisingly economical Stoves have been devised to run the market.

Lamps of late years have undergone great improvements, and some beautiful designs have been introduced both in low priced and more expensive, but they are not nearly as plentiful here as one would expect.

Buggy and Wagon Woodware and Fittings.—Although the demand for this class of goods has fallen off considerably the last year or two, principally on account of the extension of the tramway system here, and consequently the fewer coaches, &c., required, there still has

been a fair amount of business transacted in these lines. American firms are not competing in Axes for Buggies, &c., with the English, who command the Australian trade, but are, nevertheless, largely sending here Nut and half Patent axes. American Varnishes only command a portion of the trade here; the gallon measure, being less than the English, is found to be very objectionable to the retailer.

Among what may be called miscellaneous imports I may mention Ice Chests, Wood Step-Ladders, Mouse Traps, &c., Bolt and Rivet

Fig. 281.—Elevator.

Clippers, Tacks, Sewing Machines, Scales and Weighbridges, Wire Goods, Sausage Machines, Washing Machines, Wringers, &c., Davis Swing Churn, Axe Handles, Axle Grease, Lubricating Oils, Paints, Kalsomine, &c., and Smiths' Forges. A special line which adorns the windows of most ironmongers are iron toys, consisting of Mechanical Money Banks made in attractive designs, Paper-Cap Pistols, &c.

Cartridges are freely imported, and the demand seems to be increasing of late.

Barb Wire is a line in which business is always doing; there is hardly a ship leaves

own way; but, among smaller field implements, there are many that are highly appreciated for their light and handy qualities. Among these are Horse Hoes, Spring-Tooth Harrows, Acme Pulverizing Harrow, Clod Crusher and Leveler, with Reversible Coulters, Winnowers, Seed Sowers and Threshing Machines. American Plows do not seem to take in Victoria, but the Plows of B. F. Avery & Sons are well known in Sydney. Other goods favorably known are Hay Forks and Windmills.

Agricultural Hand Implements, such as Shovels, Spades, Scoops, Rakes, Tine Hay Forks, &c., are well known here.

General Machinery and Engineers' Tools are frequently met with, yet they form a very inconsiderable item when compared with the imports from Great Britain. American Pumps and Hydraulic Machinery are better stocked.

Arrangement of Stores.

We have received from A. M. Smith, Pike, N. Y., the following description of his Elevator, which is illustrated in the accompanying cuts Figs. 280, 281, 282, 283 and 284. After alluding to his store as 28 x 62 feet and 12 feet between floors, which he refers to as sufficiently high for a village, Mr. Smith says:

When I was putting in my counters and shelving I began to think how I was going to get Sash, Doors, Blinds, Nails, Stoves, Grass Seed, Clover Seed, &c., up-stairs, since the main floor would be entirely inadequate. I then started for Buffalo to see what an Elevator could be obtained for. One house offered me the boat and gearing for a light one for \$175, and I was to furnish material and put it up, besides paying freight to Pike. This appeared rather expensive to one not acquainted with such a labor-saving machine. I then visited several stores and observed the manner in which Elevators were made and managed, and having got a few points settled I came home without having purchased. I then drew up my plan and set my carpenters to work in good earnest. I first took some gearing out of a Mowing Machine in the old iron; made a drum 3 feet long and a bull wheel 5 feet in diameter; made two stationary guides out of 2-inch hard wood, bolting them well

Fig. 282.—Plan of Hoisting Apparatus, Top View.

either Boston or New York for Australian ports without a greater or less number of reels.

Among *Agricultural Implements* and machinery of American manufacture the most prominent are, of course, the Reapers and Binders, in which an immense trade has been done here during the last few years. They form a leading feature at most of the agricultural societies' shows, and during harvesting operations it will be difficult to find a district in the colony where they are not to the fore. Portable Engines of American make are, I believe, unknown here, the numerous English manufacturers of the articles having it all their

together (Fig. 280). The middle piece was only 8 inches wide, while the outer ones were 4½ inches, leaving a groove 1½ inches deep for the boat to draw up and down in. To avoid friction I cut out the tongue on the boat all but about 1 foot on the top and bottom, as shown in Fig. 281, and then set in some sash rollers to keep it just as I wanted it. This was all done by hand, and under every disadvantage possible. I paid about \$4.50 for having the irons connected with it

made, making it sufficiently strong to carry a ton with safety. With reference to the brake, Figs. 283 and 284. In this I used an inch bench-screw welded to a long arm, and a drum made upon that for a rope to run over. One end of the brake was held by a strap hinge. This brake is on the bull wheel, and will stop and hold the boat with a full load with a single jerk of the rope. The rope goes over the drum on the brake three times, and a staple fastens it in the middle to prevent any slipping. This brake rope is $\frac{1}{4}$ -inch Manila, and goes over a pulley on the lower floor by a guide, so as to be always in place and in order. The arms to the boat, Fig. 282,

the thing, as it would either stop it or let it run too fast. Then I put a leather upon a trap spring so as to draw it by means of a rope against the under side of the bull wheel, an arrangement which worked satisfactorily. I could control the elevator at will, so that with Stoves on trucks a boy 8 years old can move the heaviest Range upstairs and down, and as the elevator also goes into the cellar it can be used for taking down Oil, &c., in barrels, and other heavy goods. Now, what will make all this interesting to some reader in some town who is still using a grab or chain, taking up Stoves or bags by hitching on, is the cheapness of it all. The

them from obtaining food and shelter. B. Brothers made complaint of this combination against them, and C. and others of the typographical union and the Knights of Labor, and they were indicted for criminal conspiracy. C. elected to be tried separately and was convicted. He carried his appeal—*Crumph vs. Commonwealth*—to the Court of Appeals of Virginia, where the conviction was affirmed. Judge Fauntleroy, in the opinion, said: "The essential idea of 'boycotting,' in Ireland or the United States, is a confederation, generally secret, of many persons, whose intent is to injure another by preventing any and all persons from doing business with them, through fear of incurring the displeasure, persecution and vengeance of the conspirators. A wanton, unprovoked interference by a combination of many with the business of another for the purpose of constraining that other to discharge faithful and long-trained servants, or to employ whom he does not wish to or will employ—an interference intended to produce, and likely to produce, annoyance and loss, to that business—will be restrained and punished by the criminal law, as oppressive to the individual, injurious to the property of the community, and subversion of the peace and good order of society. The defendant lays great stress upon the Massachusetts case of *Commonwealth vs. Hunt*, 4 Metcalf's Reports, p. 111, as authority to sustain the legality of boycotting, but there is an obvious distinction between that case and this. That case arose out of the action of a club or combination of journeymen bootmakers, which had been formed simply to better their own condition, and it had no aim or means of aggression upon the business or rights of others. They simply had regulations for themselves; they did not combine or operate to oppress others. But, even in that case, the court, after supposing the case of a combination for the ultimate and laudable object of reducing by mere competition the price of bread to themselves and their neighbors, said: 'The legality of such an association will therefore depend upon the means to be used for its accomplishment. If it is to be carried into effect by fair and honorable means, it is, to say the least, innocent; if by falsehood, or force, it may be stamped with the character of conspiracy.' 'Force may be operated either physically or mechanically; or it may be coercion by fear, threat, or intimidation of loss, injury, obloquy, or suffering.' The acts of the defendant and his associates here are unlawful and incompatible with the prosperity, peace and civilization of the country; and if they can be perpetrated with impunity by combinations of irresponsible cabals or cliques, there will be an end of government and of society itself. The motto of the law is this: 'So use your own rights that you shall not injure others' rights.'"

Fig. 283.—Side View of Hoisting Apparatus.

are 7 feet long, and the bottom or platform $3\frac{1}{2} \times 4\frac{1}{2}$ feet. The cross-bar where the rope attaches to the bottom has two arms on it to catch and take up the hatchway cover of the floor above, Fig. 284. The lifting rope goes through the center of this hatchway cover, which is kept in place by guides, the same as the boat. Hence when the elevator is down the door or hole is always closed, and no one can step through.

To the main drum that winds up the boat there is a rope attached which runs

weight is a box 1 foot square on the bottom, 2 feet long, filled with fine scrap iron. It has guides on two sides and runs up and down like the boat, always there. The actual cost was considerably less than \$40, counting in my expenses. It now carries five kegs of Nails easily, and I can change the drum so as to make it handle ten, but, of course, what is gained in power is lost in time; 500 pounds is all I ever want to handle, and if I had 700 pounds on and did not care to pull much I would call for another hand to help work the rope. I would not be without it now if it were to cost me \$200 or more. If any of your readers would like further details in regard to this matter I should be pleased to send them.

"Boycotting"—Criminal Conspiracy.

B. Brothers were stationers and printers in Richmond, Va., and they refused, on the application of the Richmond Typographical Union, No. 90, to make their printing office a "union office"; whereupon these printers and a trades union association known as "Knights of Labor," the former numbering 100 members and the latter several thousand men, declaring that they would destroy the business of B. Brothers by "boycotting" them, threatened a number of the business men and others in Richmond with the loss of their business if they dealt in any way with B. Brothers, and that their names would be published in a "black list" in the *Labor Herald*. In this same *Labor Herald* the employees of B. Brothers were denounced so that public feeling should be directed against them, even to preventing

The exportation of silk from Japan during the year 1887-88 was estimated at 38,958 bales, against 26,370 bales in 1886-87. The United States are at present the largest consumers of Japanese silk and figure in the last report for nearly 21,000 bales, while only 1735 bales were exported to Great Britain. The crop of 1888, estimated, is roughly at about 6,500,000 pounds, of which about 40 per cent. will be consumed in the country.

The London *Engineer* says: Now that the question of Ramsbottom's trough is under discussion in connection with the "race to Edinburgh," it may be worth pointing out that the late Mr. Ramsbottom was not the first and true inventor of the contrivance. It was patented in America in November, 1854, by McDonald. Mr. Ramsbottom's English patent was taken out in 1860, and is numbered 1527.

Fig. 284.—Hatchway Covering.

to the back end of the shop, and there a counterweight is attached weighing about 280 pounds. Thus weighted the boat will go up at a good motion alone, and stop when at the right point. This weight is of great importance. The boat never falls or jerks around and it holds back when going down loaded as much as it helps going up. When going down loaded I soon found that my screw brake was not

Horse Hitchings.

Oliver Bros. & Phillips, Pittsburgh, Pa., for whom the H. B. Newhall Company, 107 Chambers street, New York, are agents, are manufacturing a line of Stiff Horse Hitchings, which are represented in the illustration given herewith, which ex-

ing in one of the flanges for holding the wheel in place, so that it has water both on its inside and outside. When operating the machine the water in the center of the wheel is described as being driven through the pores of the wheel, wetting every particle thoroughly. This is referred to as preventing the tool while be-

water. For grinding scissors the guide A attached by the screw C is removed. The facility with which carving or table knives can be ground on this machine is alluded to, and it is claimed that any person, however inexperienced, can do this perfectly. The weight of the machine is 5 pounds. Fig. 3 represents the Clipper Grinder

Horse Hitchings.

plains the article so fully that no detailed description is necessary. The special advantage alluded to in the use of this article is that it will prevent cribbing. It is made of iron, and is furnished both self-colored and galvanized.

Clipper Tool, Knife and Scissors Grinders.

The Higganum Mfg. Corporation, 189 and 191 Water street, New York, are putting on the market an interesting line of grinders, invented and patented by Mr. R. Dutton, some of which are illustrated in the cuts herewith given. Fig. 1 represents their No. 4 Clipper, which is run, it will be observed, by means of a belt, and is designed for grinding plane irons, chisels, gouges, &c. It has four wheels, numbered 1, 2, 3 and 4 in the cut. There are also, it will be seen, clamps E and F, which are used for holding the tools to be ground. The wheels 1, 2 and 3 are used for grinding gouges, and are respectively $\frac{1}{4}$, $\frac{1}{2}$, and $\frac{3}{4}$ inch in thickness, the rims being rounded. Small gouges less than $\frac{1}{4}$ inch in diameter will be ground upon wheels Nos. 2 and 3 while held and guided with the hands, but for larger gouges the swivel and gauge clamps, F and H, are used, the cut representing this attachment as down in the position in which it naturally remains when not in use. In using this clamp the gouge to be ground is

ing ground from heating or having its temper drawn, and also preventing the wheel from becoming glazed by use. The tool while being ground is held firmly in the clamp E, which is directly in front of the operator and controlled by his left hand by means of the handle D. By

Fig. 2.—No. 3 Clipper Grinder, with Attachment for Grinding Scissors.

this means plane irons, chisels, &c., may be quickly ground to the bevel desired, and the manufacturers allude to the accuracy and perfection with which this is done. It is claimed that with this machine a gouge can be as quickly and easily ground as an ordinary plane iron or chisel.

No. 1, which has, it will be observed, some of the features of the machine shown in Fig. 1, the corundum wheel being 5 inches in diameter, $1\frac{1}{4}$ -inch face, with a hole in the center 3 inches in diameter by which the water in the trough is given access to it. By one turn of the crank the wheel is revolved nine times, so that grinding will be done more rapidly than upon a large wheel when not geared. The same machine is made without a stand and provided with thumb screw to clamp it on the bench. It is pointed out that

Fig. 3.—No. 1 Clipper Grinder.

with this machine plane irons, chisels, &c., may be ground to any bevel desired. The company also make another machine, Fig. 4, which they designate as No. 5, which is intended for the same purpose as their No. 1, shown in Fig. 3, but it has a pulley and belt in place of a crank and gear to run it by. The speed of this machine

Fig. 1.—No. 4 Clipper Grinder, with Attachment for Grinding Gouges.

securely fastened in it at F, the hinge at H permitting the requisite pressure on the wheel, while the rocking motion permitted by the swivel allows the grinding of the entire edge of the gouge, an operation which is, it is claimed, accomplished with great ease and success. Wheel No. 4 is flat-faced, $1\frac{1}{4}$ inches thick, 5 inches in diameter, and has a hollow in the center 3 inches in diameter. The corundum grinding-wheel used in this machine is referred to as superior to the emery-wheel. Water when placed in the trough is admitted to the inside of the wheel through a small open-

This grinder is intended to be run from 700 to 800 turns per minute, the arrow showing the direction. Its weight is $17\frac{1}{4}$ pounds.

Fig. 2 represents the No. 3 machine, a tool designed for family use, for sharpening knives, scissors, &c. The machine is represented in the illustration as clamped to the corner of a table. The wheel, like that described above, is a corundum wheel 4 inches in diameter, with 1-inch face, geared to revolve six times to one turn of the crank, grinding as fast as a wheel 24 inches in diameter not geared. The wheel runs, it will be observed, in a trough of

Fig. 4.—No. 5 Clipper Grinder.

should be from 700 to 800 revolutions per minute. They also make a No. 2 Grinder in which a free grit stone is used. It is a small and compact machine for sharpening tools, knives, &c.

The American Frame Pulley.

We illustrate herewith the American Frame Pulley, a new form now being put on the market by Palmer Hardware Mfg. Company, Troy, N. Y. Like their other

Fig. 1.—The American Frame Pulley.

styles of pulleys, it has its face edges curved to adapt it to fit a mortise made of a series of connected auger holes, and has markers on its edges with which to indent in the wood the exact centers on which to

L. & I. J. White.

The following article from the Buffalo Express, giving as it does a history of this long-established and well-known house, will be read with interest:

Buffalo possesses numerous points of advantage for the manufacture of specialties, and among the local industrial establishments are many whose field of operations covers the whole nation. One of the firms who e mail bears the postmarks of almost every town in the United States, as well as the strange stamps of foreign countries, is the long-established edge-tool works of L. & I. J. White, at Nos. 310, 312 and 314 Exchange street. Mr. Leonard White, the surviving partner of this widely known firm, is the oldest practical edge-tool man in America. He was born in Tolland, Conn., November 16, 1810. His family migrated to this State in 1819, settling in the town of Elba, Orleans County. When Mr. White was 16 years of age he went to Rochester to learn the trade of an edge-tool maker. For 10 years he remained in the employ of D. R. Barton, at that time the only prominent edge-tool manufacturer in this country, and during a decade of hard work he mastered the business in all its details.

In 1836 Mr. Leonard White, in company with his brother, Mr. I. J. White, established an edge-tool factory at Monroe, Mich., where for some years they carried on a flourishing business. Becoming impressed, however, with the idea that Buffalo was a more advantageous point of distribution than the Michigan town, they decided finally to change their base of operations. Accordingly, in 1844, Mr. I. J. White came here and established a new plant, on the corner of Ohio and Indiana streets.

In 1879 Mr. I. J. White died, but the well-known firm name is still retained by his brother.

Taft's Vise Wrench.

This article is manufactured by Chas. A. Bowen & Co., Sterling Ohio, and is illustrated herewith. The special feature of the wrench is the tightening device, the arrangement of which is shown in the cut. From this it will be seen that the wrench is provided with a lever, which serves as a tightening device. This lever works on a screw in the ferrule. In use the wrench is screwed on to the work in the ordinary manner, the lever being raised in a perpendicular position, when, by pressing the lever down to the position shown in the cut, the wrench is given a vise-like grip so that it cannot slip from the work. The wrench itself is described as made of the best material, care being taken to make it a first quality article, and the manufacturers allude to the advantages it possesses in view of its tightening device, mentioning among other points that it never slips; that it is a combination of wrench, hand-vise and clamp in a single tool; that with it nuts can be taken off the corners of which have been grooved or rounded; that with it hot nuts may be removed without handling them, while they also indicate several other purposes for which it can advance-

Taft's Vise Wrench.

start the bit. The case is made up of a series of angular swellings, the apexes of which extend slightly beyond the curved lines of the face edges—the rear edge of the case being a hollow chisel. The manufacturers claim for this construction entire avoidance of the danger of splitting the jambs, as is likely to occur with those made to fill at all points a like mortise, on account of variation in position or inclination of the holes, which is unavoidable in those bored by hand. This improved form, it is claimed, will, by means of the

Fig. 2.—Mortise for American Frame Pulley.

rear chisel edges, cut away all obstructions caused by imperfect boring, and the apexes of the angles will hold it firmly in place. Its finish is referred to as being of the best. Only one size, 2 inches, is made. The pulleys have steel axles, and a 7/8-inch bit is used for mortising.

Two years later he was rejoined by his brother, who had remained in Michigan to close up the business.

About 20 years ago the works of the firm were destroyed by fire, and being desirous of rebuilding on a larger scale, the Exchange street property was secured and the present extensive works were erected. The main building, a three-story brick, is 60 x 104 feet, with an addition, 55 x 104, extending through to Carroll street. The large structure contains on the first floor the office and the grinding and polishing departments, where the duly shaped and tempered tools receive their polish and cutting edges. On the second floor is the storeroom, where the finished tools lie in drawers and cases, all classified and ready to start on their journey to Nova Scotia or San Francisco, at an hour's notice. Here too are the machine shop, pattern shop and handling department. The third floor is used as a storeroom for handle stock, packing boxes, &c.

The entire extension is used as a forgeshop, and here, by means of Trip Hammers, Drop Hammers, and powerful rolls, driven by a 120 horse-power engine, the metal red from the furnace fires is welded, hammered, and rolled into the shapes which give the first hint of the finished tool. Practical edge-tool men declare this to be the best-equipped tool-forge shop in this country.

The implements made by L. & I. J. White may be divided into four general classes. First and most important among these is their line of Cooper's Tools, of which, with perhaps a single exception, they are the most extensive makers in America. These include every imaginable implement pertaining to the cooper's trade. The firm likewise turn out a great many carpenters' tools, particularly Chisels, Draw-Shaves, Plane Irons and Ship-Carpenters' Tools. A third specialty of the house is a complete assortment of Butchers' Tools, embracing all the implements used in packing houses and meat markets. And last, but not least at the present time, the vast increase in the number of planing mills and kindred industries requiring Knives, the same including Stave, Hoop and Veneer Knives, Paper-Cutting and Leather Splitting, &c., has enlarged the demand to such proportions that the Machine Knife department is now one of the most important of the business.

tageously be used. Its utility in the machine shop and for general use is also referred to.

Improved Dial.

Miller Lock Company, Philadelphia, Pa., have made some recent improvements in their Champion Keyless Locks, one of

Dial (New) for No. 302, Full Size.

which relates to the combinations being made more simple without any sacrifice of security, so as to obviate the difficulty of understanding and fitting these locks in place correctly. Another improvement is in the enlargement of the dial, which is made as legible as possible, as shown in the accompanying illustration. This change is made to overcome as far as possible the difficulties in using keyless locks where there is an imperfect light, and is regarded as a decided improvement. As

some, however, may prefer the former style of dial the company are making both the old and the new. The demand for these locks for private use and for clubs, gymnasiums, associations, &c., is referred to as being such as to require an increase in the manufacturing facilities.

Sure-Grip Steel Tackle Block.

The Fulton Iron and Engine Works, Detroit, Mich., are putting on the market the Detroit Patent Sure-Grip Steel Tackle Block, which has been invented by Alexander M. Kerr, the superintendent, and patented September 4, 1888. The special feature of its construction is the brake, which, it will be observed, is exceedingly simple, consisting only of a wedge, which is

Fig. 1.—Detroit Sure-Grip Steel Tackle Block.

double acting, and so efficient in its operation, that it is described as absolutely automatic and certain in holding a load suspended at any desired height without fastening the rope. The body is made of steel plates, the pins being cold rolled steel. The castings are malleable iron, thus making an especially strong and safe construction. The brake is a fluted wedge, dropped between two ropes in such a manner that the load is brought on all strands of rope at the same time. It is also pointed out that the heavier the load the more efficient the brake, owing to the fact that the fluted wedge is drawn down and points between the sheaves in proportion to the weight of load. It is also pointed out that the construction is such that the brake does not flatten the rope, wear on it being thus reduced to a minimum, and it is claimed that a partially worn rope can be used in this machine to as good advantage as a new one. The economy of labor connected with its use is also alluded to, as by its use one man can take the place of two as the brake holds the load at the end of each effort made by the operator,

thus enabling him to secure a fresh grip on the load with both hands, or the load can be left hanging at any point without further attention. This block is intended for use by bridge and ship builders, contractors, hardware and other merchants, truckmen, machine shops, &c., and in

Fig. 2.—Showing Arrangement of Brake.

stringing heavy electric wires, handling barrels, baled hay, &c. The invention is the result of a necessity long felt in the company's shops for a block which would raise and lower quickly and where the height of hoist is not limited, and with no possibility of the brake slipping when the load is suspended. The satisfaction with which the contrivance has been received in the short time it has been on the market is alluded to as indicating that it meets a want of the trade.

The Reddy Ventilator.

James M. Reddy, 317 South State street, Chicago, has designed an apparatus for securing increased efficiency from stoves, which he designates the Reddy Venti-

The Reddy Ventilator.—Fig. 1.—Sectional Elevation.

lator and Coal and Wood Economizer. It is illustrated in the accompanying cut, and consists of a sheet-iron cylinder with heads of cast iron. It is fitted with pipe collars at the top and bottom and can be used in various ways. It can be placed on top of an ordinary cylinder stove, with the smoke-pipe attached to the top and passing thence to the chimney; or it can take the place of a section of pipe on a base-burner; or it can be used as a drum

in an upper room, having a connection through the floor with a range, cooking stove or heating stove in the room below. Its construction is simple. There are two sheet-iron drums, having a spiral division running up between them, with openings at the top and bottom. Air from the room passes into the center drum, and the smoke and heat from the stove circulate around the spiral passage between the

Fig. 2.—Looking Down on Top of the Head of Ventilator, Showing Damper.

two drums, heating the air, which is discharged into the room again from the upper openings, while the smoke is conveyed through the regular stove-pipe up the chimney. Two cuts herewith given show the construction of the head of the heater. This has a ventilating damper, which is left open for ten minutes or so at frequent intervals to take the foul air from the room up the chimney. When this ventilator is open no heat is thrown out into the room from the heater, but when it is closed the heater again discharges hot air into the

Fig. 3.—View Looking Inside the Head of the Heater, Showing its Construction.

room. It can be readily perceived that this device forms quite a reinforcement to the power of a stove of ordinary construction and thus secures additional heat from the fuel burned, making it possible to secure much more heat from the same fuel than when the stove alone is used. The size of the heater is 33 inches high and 12½ inches in diameter. It is mounted with either Wood's Russia planished iron or smooth sheet iron.

The Car Spring Association.—The directors of the Railway Car Spring Association held a meeting at the Hotel Anderson, Pittsburgh, on Saturday, the 18th inst. A. French, chairman of the A. French Spring Company, Limited, of that city, presided. The meeting was preliminary to the general meeting to be held on Wednesday of the present week. Only two firms in the United States are not in the association, one being the Atkinson Car Spring Company, of Chicago. This firm have brought suit against the organization and also against Park, Brother & Co., Limited, of Pittsburgh, who refused to sell them steel except at an advance of \$10 per ton over what members of the association paid. The directors talked over the disposition of these two suits, and, it is reported, will contest them to the end.

THE IRON AGE

THURSDAY, OCTOBER 25, 1888.

A New Oil Cup.

Messrs. Pedrick & Ayer, 1025 Hamilton street, Philadelphia, Pa., are bringing out the new form of oil cup shown on this page. The engravings give a good idea of the appearance and construction of the device. Fig. 1 is a rod oiler, the top of which screws on, or can be made to slip on and be held by a spring catch. Fig. 2 is a guide oiler, the cover of which has a small vent hole in the top to admit the air to facilitate feeding the oil, and also to allow it to be taken off readily. Fig. 3 is a section view of the rod cup, showing the internal arrangement. This is the same in all the cups. The bracket-shaped piece in the interior of the cup is split open. It is wedged apart at the time that the screw is cut, so that it always, even after long use, clamps the spindle and holds it in any de-

Fig. 1.—Rod Oiler.

Fig. 3.—Section of Rod Oiler.

Fig. 2.—Guide Oiler.

NEW OIL CUP, MADE BY MESSRS. PEDRICK & AYER, PHILADELPHIA, PA.

sired position, without the aid of jam-nuts or binding screws. Around the upper edge of the cup are marks by which the engineer can adjust the opening to feed the required amount, according to the temperature of the weather and the quality of oil used. When the engine is out of use, it is only necessary to screw down the spindle and the flow of oil entirely stops. The oilers are made in two sizes. A cup, similar to the guide cup, for locomotive truck brasses is made. These oil cups are in very extensive use by the Northern Pacific and the Philadelphia and Reading R. R. Companies, and are claimed to be superior to any other cup ever used. The spindle is easily manipulated and remains in any desired position; no extra tools are needed for adjustment, and they can be easily cleaned out, there being plenty of room for that purpose.

The Philadelphia and Reading Coal and Iron Company have commenced to make use of the sinking fund to cancel the mortgages on its lands. Some time ago the Board of Management directed that 10 cents per ton on all coal mined for the lands owned by the company should be set aside as a sinking fund to be used either in the acquisition of additional lands or in liquidating coal land bonds and mortgages. When some of these bonds were purchased

mortgages were allowed to remain. On the 1st of next month the company will pay off and cancel a divisional mortgage on the Raudenbush tract. The amount is \$110,000, and the property covers 1100 acres.

Flow of Steam in a Tube.

Through an oversight, a more extended reference to Mr. C. H. Peabody's paper on "Flow of Steam Through a Tube," presented last week before the American Society of Mechanical Engineers, was omitted from our last issue.

The paper was a record of some experiments on the flow of steam made in the mechanical engineering laboratory of the Massachusetts Institute of Technology. The tube used in these experiments was of brass 0.275 inch internal diameter and 8 inches long. At the entrance end a plate,

plied with a good steam gauge and with a thermometer in a long brass cup filled with oil. The gauges were compared with a mercury column and the thermometers were calibrated and their freezing and boiling points were determined. The exhaust steam was condensed in a small surface condenser and weighed in a tank.

The experiments were begun after the apparatus had been running steadily for some time and lasted about half an hour. Steam for the experiments was drawn from the main steam-pipe, and, as the supply-pipe had a drip near the apparatus, which remained open during an experiment, it was assumed that the quality of the steam was the same as that in the main pipe. A large number of experiments with different types of calorimeters gave 1½ to 2 per cent. of moisture in the steam. Later experiments with a new

1½ inches in diameter, was driven on flush with the end of the tube, and the orifice was well rounded to avoid contraction. This tube led from an iron pipe 6 inches in diameter and 2 feet long. The brass tube discharged into another iron pipe 6 inches in diameter and 2 feet long, which formed a chamber in which the steam came to rest, and from which it was led to a surface condenser. The two pieces of 6-inch pipe were capped on the outer ends, and had flanges on the inner ends, between which was a plate holding the experimental tube. The whole apparatus was lagged on the outside, and the plate holding the brass tube was covered on both sides with about 4 inches of asbestos to prevent the flow of heat from one part of the apparatus to the other.

Steam was led to the apparatus by a lagged pipe 1 inch in diameter and away from it to the condenser by a pipe of the same size. Each of these pipes had a valve near the apparatus. The valve in the supply-pipe was used merely to shut off the steam when the apparatus was not in use, and, during an experiment, it was wide open, so that the pressure in the first 6-inch tube was full boiler pressure or nearly so. The valve in the exhaust-pipe was manipulated to maintain the desired difference of pressure between the two parts of the apparatus. Each chamber of the apparatus was sup-

plied with a good steam gauge and with a thermometer in a long brass cup filled with oil. The gauges were compared with a mercury column and the thermometers were calibrated and their freezing and boiling points were determined. The exhaust steam was condensed in a small surface condenser and weighed in a tank.

As the more recent data were not available till the work was nearly complete, the moisture was assumed to be 2 per cent. in all the calculations. The error from this source is inconsiderable. The data and results of the experiments are given in the following table:

	Pressure of steam in front of tube.	Pressure of steam beyond tube.	Difference of pressures.	Flow of steam per hour by tank in pounds.	Flow of steam per hour, calculated in pounds.	Gt. Gc.
1.....	69.1	4.4	64.7	239.0	182.3	1.260
2.....	69.6	9.7	59.9	230.4	211.2	1.091
3.....	71.3	14.8	56.5	242.0	233.4	1.037
4.....	69.1	19.4	49.7	232	242.2	0.958
5.....	70.0	24.5	45.5	234.5	256.6	0.914
6.....	70.3	29.1	41.2	229.0	261.5	0.876
7.....	72.00	34.2	37.8	232.0	268.9	0.860
8.....	72.00	39.5	32.5	221.4	268.9	0.830
9.....	71.6	44.2	27.4	216.5	260.1	0.833

The table will be readily understood from the headings. The ratio of the actual

quantity to the calculated quantity, if the theory were entirely applicable to this case, should resemble the coefficient of flow for water through a short pipe, and should not be greater than unity. The marked, though regular increase of this ratio with the increase of the difference of pressure, and the fact that, for the larger differences, this ratio is larger than one, shows conclusively that some of the assumptions are inadmissible. It is not improbable that heat is given by the steam to the tube at the admission end, and regained by the steam toward the exit end. Such an interchange must influence both the condition of the steam at the orifice and the rate of flow. The well-known phenomena of cylinder condensation and re-evaporation in steam-engines show that such an action may be energetic. It is also possible that the length of the tube is not sufficient to insure a steady flow. It is noticeable that the weight of steam discharged by the tube has a maximum, which is for a difference of pressure of about 35 pounds by theory, and for a difference of pressure of about 55 pounds by experiment. All the work of experiment and calculation was done by Mr. G. Buttolph.

Specifications for Steel Rails.

In our report of the meeting of the American Institute of Mining Engineers, at Buffalo, we referred briefly to a paper read by R. W. Hunt, of Chicago, Ill., on "Steel Rails and Specifications for Steel Rails." Passing over that part of it which deals with the history of their manufacture and with the question of the form of modern heavy sections, we may quote those parts of the paper which are explanatory of the provisions of the specifications.

We will assume the section selected to be the best possible; it now remains for the maker to furnish a good rail rolled to it. The character of the permanent way of the railroads of the United States is improving each year. Consequently the demand that the mills shall deliver their rails well finished and straight in all directions is much more imperative than in the past. Of course, absolute accuracy in so gross a product is both unnecessary and impossible, but practical accuracy is attainable.

I consider it of the utmost importance that most of the straightening shall be done while the rails are hot. In other words, that the hot straightening shall be conducted so as to leave the minimum work for the cold press. Every blow of the gag is a bid for a break. The harder the steel the greater the danger. Moreover, gagging is apt to take out one bend by putting in two others, thus endeavoring to have two wrongs make a right. To bring the breaking danger down as low as possible, the cold straightening should be done before the rails are absolutely cold. At the same time if the rail goes under the cold press too hot the steel will not possess elasticity, and each blow will leave a dent; and if excessively applied the rail will be either wavy or lumpy. Such rails will of course make a rough track. Some mills in taking side bends out of their rails apply the gag to the flange. I cannot approve of this, and believe that it greatly increases the danger of broken rails. But after the rails are delivered to the trackmen they should not be carelessly thrown from the cars. This was not the practice with the early steel rails. The drilling should be accurate, and if proper drill presses and drills are used it can be done. If the holes are to be anything, from $\frac{3}{8}$ under to $\frac{1}{8}$ over size, I do not see any use in naming the diameter in the specifications.

So long as the purchasers of rails exact a guarantee from rail makers, I think the chemical composition of the steel should be largely left with them. But if the purchaser believes that carbon is the best hardening element for steel, it is not unreasonable to ask for as much as the maker is willing to put in, knowing what proportions of other elements his metal will contain, and still guarantee his rails. No doubt as the sections are increased harder steel can be safely used. The mere replacing of a broken rail with a whole one may fall far short of the damage sustained by the road on whose track the accident has occurred, leaving the danger to human life out of consideration. Therefore the purchaser has a right to insist upon some precautions being taken to avoid as far as possible such disasters. And these precautions, if correct ones, are also in the interest of the makers. Steel rails are made very rapidly, and the demands of the trade necessitate that they shall be made very cheaply. The workmen are paid by the piece, and while generally making good wages, they must produce a large tonnage to realize them. No matter how desirous the general management may be of producing only good work, it is very necessary that safe guards should be provided. Most makers have these in some form, but there are mills where the chances are taken.

The tests which I prefer are those I used for 15 years at Troy. My experience gives me confidence in them. I do not wish to say that Troy rails have never broken in service, but such accidents have been very infrequent, and could almost always be traced to individual mechanical causes. This plan of making tests has the merit of furnishing a check on the grade of the steel early in its manipulation; and I consider it more convenient than any drop test, and at least equally efficient.

As may be generally known, the Troy works have for years made a very wide range of Bessemer steels. From 0.05 per cent. to 1 per cent. of carbon; and we were fortunate enough to have considerable reputation for our success in so doing. On the higher grades, where great accuracy was required, it was my practice to have a test ingot taken to represent every 15-inch ingot cast. This accomplished two results—it made the workmen careful and let us know of any variations which might occur. I do not think this extra precaution necessary in making rail steel in any works where ordinarily good practice prevails, and I should most certainly discourage any of my clients from contracting for rails with others.

As has been proven by the fracture of many ingots, the steel in cooling, if the ingot is left upright until the interior steel sets, will form a funnel-shaped cavity in its top end. But if the ingot is thrown upon its side before that metal has solidified, this cavity will extend lengthwise, the distance being limited by the condition of the interior steel. Hence it is manifest that ingots should not leave an upright position before the metal has set sufficiently to prevent this cavity from so extending. Everything is against this lengthwise defect being taken out by the subsequent rolling of the ingot, and it will most probably cause pipes and cold shuts in the rails; but if the cavity is maintained at the top end of the ingot it can be cut off. Again, if ingots are drawn too soon from the pit and thrown upon their sides, there is danger of the crust which has formed at the top end breaking and permitting the interior liquid steel to escape or "bleed." That will certainly make a pipe.

It is only from sound and compact ingots that we can hope to produce good rails. Such ingots only can be made by care in casting them. Therefore, the careful steel-maker will not only use good molds, but also exercise a close supervi-

ion over the manner of pouring the heats. When from any cause this is not or cannot be done the resulting ingot should not go into No. 1 rails. Nearly every manufacturer uses somewhat different sized ingots, and frequently they vary in their shape. Of course each one follows the practice which under the controlling circumstances seems to yield the best results. It is well known that the same length ingot will not always roll equally well. I have found, when the metal was cracking badly in the blooming rolls, good results to be at once obtained by pouring the ingot shorter. Of course this is easily explained, and points to the necessity of closely watching and controlling the temperature of the "blow" in the converter. And I fully believe that a strong influence on the quality of the resulting steel rests at this very point.

As every ingot, if properly handled, has more or less of a cavity at its top end, therefore the bloom rolled from it will be piped or spongy at that end. To be certain of having a sound rail made from the upper part of the ingot, a sufficient length must be cut off to remove this spongy steel. These pieces need not necessarily be treated as scrap, there being many purposes for which they will answer.

It is not necessary for me to tell this institute that care should always be exercised in heating steel. As the carbon is increased, so is the danger. I believe more unsatisfactory rails can be traced to over-heat in the furnace than to any other one cause. I commend our fellow-member William Metcalf's paper, "Steel; its Properties; its Use in Structures and in Heavy Guns," read before the American Society of Civil Engineers March 2, 1887, to the careful consideration of every steel maker and user. It is, in my judgment, worthy to be considered a text-book on the treatment of steel.

My investigations of the service of thousands of tons of rails, and the analyses of many hundreds of them, have shown the greatest variation in the wear of rails of the same section and chemical composition. This being so, there must be some physical cause. Can we find a chemical reason for rails showing "soft" in wear, having the following chemical composition?

Carbon.....	0.39
Sulphur.....	.059
Phosphorus.....	.085
Manganese.....	.722

If so, why did another make, in the same track and under seemingly the same conditions, analyzing as follows, wear "hard?"

Carbon.....	0.40
Sulphur.....	.064
Phosphorus.....	.080
Manganese.....	.779

I could multiply these instances to an indefinite extent, but will not take up time. Our Bessemer friends are all right on their chemistry. They know a great deal more than the people who made those early good rails, and it is not in that direction that investigation is most needed.

As I said early in this paper, every rail-maker wants to give his customers good rails. Now, I honestly believe it is to his interest that the purchaser should be represented by intelligent inspection. No matter how good the mill organization may be, the men all work by the ton, and do not always realize the importance to their own interests (which are the same as their employers), that only good work should go out. Hence, the right kind of inspection is of assistance to any mill. If I were a purchaser of rails, I should draw fuller specifications than these, which I now have the honor to present to you, and I should accept all the risk of the results. But railway managers are not yet willing to assume this position. I have, therefore, endeavored—while not relieving the makers of any responsibility, or intro-

ducing novel practices—to assist the railroads in obtaining better and more uniform rails.

It is recognized as the commercial rule that rail-makers should give a guarantee with their rails. In these specifications I have embraced such an one as is given by some of the largest makers in the country, and under which they have sold rails for many years. It seems to me to be fair in its provisions, and I believe the other requirements of my specifications will tend largely in the direction of making the sellers safe in the guarantee. If this is so, the railroads will, of course, receive satisfactory rails, and everybody ought to be happy.

HUNT'S SPECIFICATIONS FOR STEEL RAILS.

Section.

SECTION 1.—The section of the rail rolled shall conform to the template furnished by the railroad company with an allowance in height of 1-64 inch under, and 1-32 over, being permitted in a delivery of 10,000 tons of rails. The fit of the fishing or "male" template shall be maintained perfect.

SEC. 2.—The weight of the rail shall be kept as near to pounds per yard as is practical after complying with Section 1.

Lengths.

SEC. 3.—The standard length of rail shall be 30 feet at a temperature of 60° F. Shorter rails of lengths will be accepted to the extent of 10 per cent. of the entire order. A variation in length of ¼ inch longer or shorter than the above specified lengths will be allowed.

Finish.

SEC. 4.—The rails must be free from all mechanical defects and flaws, and shall be sawed square at the ends, and the burrs made by the saws carefully chipped and filed off; particularly under the head and on top of the flange. In sawing care must be taken to avoid a flow of steel which will produce a swell on the top of lower flange, as the rail lies under the saw, thereby affecting the fit of the fish-plate.

SEC. 5.—The rails shall be smooth on the heads, straight in all directions, both surface and line, and without any twist, waves or kinks, particular attention being given to having the ends without kinks or drop. The hot straightening shall be carefully done, so that gagging under the cold press will be reduced to the minimum, and so applied that the rails shall not be made "lumpy."

Drilling.

SEC. 6.—Circular holes 1 inch in diameter shall be drilled through the web at 12 inches from the bottom of the flange. The center of the first hole 12 inches from the end of the rail; and 12 inches from the center of the first to the center of the second hole, and so on if more than two holes are required. These holes must be accurate in drilling in every respect, and left without burrs.

Branding.

SEC. 7.—The number of the charge, the name of the maker, the month and year of manufacture, shall be marked in plain letters and figures on the side of the web of the rail in such a position as not to be covered by the fish-plates when laid in the track. If the purchaser prefers, the number of the charge shall be stamped on the end of the rail.

Percentage of Carbon.

SEC. 8.—The steel to contain as high a percentage of carbon as the maker is willing to put in and still meet the requirements of sections 9 and 21.

Tests.

SEC. 9.—While the heat is being cast, two (2) test ingots shall be made. The first from steel going into the first regular ingot, the other from metal representing the last one. These test ingots shall be 3 x 3 inches and not less than 4 inches long. From them bars at least ½-inch square shall be drawn at one heat by hammering. Each bar when cold shall be bent, without breaking, by the blows of a sledge to not less than a right angle. Should one bar from a heat fail and the other stand the test, a third bar may be taken from a bloom rolled from the same ingot represented by the failed bar. If this stands the test it shall be accepted in lieu of the failed one. If the makers choose, more than the two test ingots may be taken, but they must be from the steel of the first and last regular ingots. If this is done and a test bar fail, another one may be drawn from the duplicate ingot and tested, and if it stands, accepted.

Treatment of Ingots.

SEC. 10.—After the ingots are cast they shall be either constantly kept in an upright position until ready to be rolled, or else so maintained until the interior steel has had time to solidify.

SEC. 11.—No "bled" ingots, or ingots from "chilled" heats shall be used in the manufacture of rails under this contract.

SEC. 12.—No ingots from badly teemed heats shall be used, excepting as they shall be subject to the provisions of section 16.

Cutting of Blooms.

SEC. 13.—After cutting off, or allowing for the "sand" or top end of each ingot, at least 12 inches more of seemingly solid steel shall be cut off that end of the bloom, or partially formed rail; if the latter, then the pieces so cut off shall equal 12 inches in length of a 7 x 7 inch bloom; a greater length than 12 inches being preferred; and if after cutting such length the steel does not look solid, the cutting shall continue until it does.

Heating.

SEC. 14.—Care shall be taken to avoid overheating the steel in shape of either ingots or blooms; and under no circumstances shall a "cinder" heat be allowed—that is, a heat high enough to cause the cinder to run off the steel as it is being drawn from the furnace. This does not apply to cinder which may be sticking to the under side of the steel, when drawn from a horizontal furnace, or to the bottom of an ingot when drawn from a soaking pit.

Inspection.

SEC. 15.—Inspectors representing the purchaser shall have free entry to the works of the makers at all times while this contract is being filled, and shall have all reasonable facilities afforded to satisfy them that the rails are being made in accordance with these specifications. The makers shall furnish them with the carbon determinations of each heat, if so required.

SEC. 16.—The inspectors shall have power to reject rails made from insufficiently sheared blooms, or from heats the test pieces of which have failed, or from badly poured heats, or from "chilled" heats, or from "bled" ingots. The rails made from uncut blooms, if otherwise perfect, to be received as No. 1 short rails, if sufficient lengths have been sawed off to make an amount of steel equal to the original demand of 12 inches. The rails made from heats, the test pieces of which have failed, may be accepted as No. 2 rails. The rails from a badly poured heat may be received as No. 2 rails, but, if made from a "chilled" heat or "bled" ingot, to be absolutely rejected. By an imperfectly poured heat is meant one which from any cause has been teemed without the control of the operator. A "chilled" heat is one which, from the steel chilling, has to be either pricked or poured over the top of the ladle. A "bled" ingot is one from the center of which the liquid steel has been permitted to escape.

SEC. 17.—Imperfectly drilled, straightened or chipped or filed rails shall be rejected, but will be accepted after being properly finished.

SEC. 18.—Rails failing to comply with section 1 will be rejected as No. 1 rails.

No. 2 Rails.

SEC. 19.—The requirements of No. 2 rails shall be the same as for the No. 1, excepting they will be accepted with a flaw in the head not exceeding ¼ inch, and flaws in the flanges not exceeding ½ inch in depth, and may have been made from an imperfectly poured ingot or heats from which the test bars have failed.

SEC. 20.—No. 2 rails to the extent of per cent. of the whole order will be received.

Guarantee.

SEC. 21.—The rail makers to guarantee the No. 1 rails against breakage and unusual wear at the ends or elsewhere for five years from the time of delivery to the railroad company; and should any such rails so fail, will, upon the return of such failed rails to their works, deliver free of cost on cars at their works perfect rails to replace such failed rails. The failure of which is not attributable to improper laying or want of care after being laid, or unusual circumstances of derailment from failure of other railway machinery or appliances, or negligence of the railroad company's employees. In event of failure at the ends or elsewhere of the No. 1 rails, not exceeding 10 per cent. of the amount of the contract before the expiration of five years' guarantee (and when the rails in all other respects warrant such a course), the railroad company will cause to be cut off so much of such rails as may be necessary to make perfect rails of them, but in no case leaving them less than feet in length, the maker to pay in cash for cutting, redrilling and reststraightening such rails. The loss in weight so sustained by the railroad company to be made up to them by the makers on the return to them of the pieces so cut off in good and perfect full-length rails of such section as may be agreed upon. The points of delivery of failed rails, ends of rails cut off and rails to replace the same, or mode of such settlement, may be varied to conform to the peculiarities of each contract.

A Copper Syndicate Contract.

We reproduce below one of the contracts between the famous copper syndicate and one of the Lake Superior mining companies:

Agreement made this 19th day of April, in the year 1888, by and between the Atlantic Mining Company, of New York, a corporation organized and existing under the laws of the State of Michigan, hereinafter called the sellers, and La Société Industrielle Commerciale des Métaux de Paris, hereinafter called the buyers, witnesseth: The parties hereto having, in consideration of the sum of \$1 to each of them in hand paid by the other at or before the enrolling and delivery of these presents, the receipt whereof is hereby acknowledged, and for other good and valuable considerations to them thereunto moving, mutually agreed together as follows:

1. The sellers herein agree to sell, and hereby do sell, to the buyers the entire copper output of their mines for about three years, commencing May 1, 1888, and ending December 31, 1890, estimated at 4,500,000 pounds of refined copper for each of the three years, and at all events not to exceed this amount per year, deliveries by sellers during 1888 not to exceed two-thirds of the above stipulated amount.

2. The price of such copper to be 13 cents per pound cash on delivery in New York, and in addition such sum as shall be equal to one-half the net profits realized above this price on resales thereafter made of said copper as hereinafter provided.

3. The copper is to be made by the sellers and delivered to the buyers in any shape or shapes or sizes ever made by the Detroit and Lake Superior Copper Company, which the buyers may desire and designate according to schedules to be furnished to the sellers by the buyers through Jere Abbott & Co., of New York, provided such sizes can be made of the company's mineral by the smelting works, but in the absence of schedules the copper is to be put into ingots.

4. The copper shall be delivered by the sellers in New York City free on board ship or at warehouse for storage as the buyers may direct.

5. Under the sole direction and control of the buyers, the sellers, when so requested, will act for them without charge or commission in selling, invoicing and collecting payments for any of this copper which the buyers desire to be resold in the United States, and such copper may be forwarded directly from the smelting works to any required point, the delivery of same at New York as provided in article fourth being waived by the buyers.

6. Payments to the sellers by the buyers hereunder shall be made cash on delivery or on tender of the shipping or storage documents—namely, bill of lading or warehouse receipt and Detroit and Lake Superior Mining Company's certificate of weight.

7. The copper shall be produced and delivered as nearly as possible in equal monthly quantities.

8. The sellers are not to be held responsible for failure to deliver at any time caused by strikes of workmen in their own employ or in the employ of others, accidents at the mines or works, lack or interruption of transportation or any other causes beyond their control.

9. It is also understood that the estimate of production herein stated is greater than the average annual production of the sellers mines, and, on this account, the sellers are not to be held liable for failure to deliver the full quantity herein mentioned, provided there shall be any failure of production of the mines.

10. Any deficiency of production in any one year is not to be added to the production of the following year; but this applies

only to deficiency of production and not to delay in transportation.

11. Upon the execution and delivery of this contract, the buyers agree to deliver to the sellers a letter of credit of satisfactory bankers for amount of all purchases under this contract, down to May 1, 1889, which letter of credit shall provide for payment by the bankers, on tender or delivery to the bankers of the documents above specified; such letter of credit to be availed of by the sellers for such portion of the copper as is not resold through them in the United States; and at least 30 days before May 1, 1889, the buyers shall furnish to the sellers an additional letter of credit, which shall be similar in form and substance and cover all purchases made and delivered hereunto until May 1, 1890, and at least 30 days before May 1, 1890, the buyers shall furnish to the sellers an additional and similar letter of credit covering the balance of all purchases and deliveries made under the said contract; it being understood and agreed that the sellers will not draw on or against any of the credits so given except after demand of payment on the buyers or their agents and default therein. It is further understood that in no one month shall the said credit be drawn against for an amount greater than the contract price of the proportionate delivery of copper for such month under this contract.

12. The sellers agree to guarantee all the sales that shall be made by them hereunder for the buyers, such guarantee to extend only to a guarantee of the cost price to the buyers of said copper under this contract, but no further; it being the intention hereof that to the extent which the sellers resell the said copper for the buyers, they shall release the said buyers from any further obligation to account to them therefor, but the said sellers, in case of loss by any such sales, shall not be bound to compensate the said buyers for any loss of profit arising to them thereby.

13. The sellers in addition to the price of 13 cents per pound, herein agreed to be paid by the buyers for copper delivered hereunder, shall be entitled to receive from the buyers one-half of the net profits that shall accrue by reason of resales of the said copper either by the sellers as agent for the buyers or by the buyers either in the United States or elsewhere after deducting storage, ocean freight, insurance, charge for interest at the rate of 6 per cent., and all other charges, including brokerages, but no commission shall be charged by either party for effecting such resales.

14. The said sellers shall render monthly accounts of all productions of their mines and of all resales made by them hereunder as the agents of the buyers, and the buyers shall also account for all resales made by them; and settlements of profits arising from resales by either party shall be made quarterly.

15. Messrs. Jere Abbott & Co., of New York City, are hereby nominated as agents for the buyers to receive for them notice of shipments and demand of payment, and to give direction as to the delivery, and to receive tenders, and to direct as to resales, and to receive shares of profits arising by said resales, and generally to act for the said buyers in all matters in connection with this agreement; and on the failure of the said Jere Abbott & Co. to act as such agents, the bankers named in said letters of credit shall be considered and hereby are acknowledged as agents of the buyer for those purposes.

16. It is further mutually agreed between the buyers and the sellers that all matters of differences arising with reference to the obligations of this contract or the interpretation thereof shall be submitted to three arbitrators resident within the United States, one of whom shall be appointed by the buyers, another of whom

shall be appointed by the sellers, and a third of whom shall be selected by the two arbitrators thus appointed, and that the said arbitrators shall promptly hear, and a majority of them determine, all such questions of difference and make their award in writing, which award shall be binding upon the parties hereto.

In witness whereof the said Atlantic Mining Company of has caused these presents to be sealed with its corporate seal, and the same to be subscribed in duplicate by its treasurer, and the Société Industrielle et Commerciale des Métaux de Paris has.

SOCIÉTÉ INDUSTRIELLE ET
COMMERCIALE DES MÉTAUX.
E. SECRÉTAN, Administrateur-Directeur.

Identification of Dry Steam.

A paper of special value, presented at the Scranton meeting last week of the American Society of Mechanical Engineers, was by Mr. James E. Denton, on "The Identification of Dry Steam." We take pleasure in publishing in this issue several of the engravings which accompanied it, and need, perhaps, scarcely say that the interest attached to the subject makes its further consideration eminently desirable. The paper, as we explained in a brief reference to it in our report of the Scranton meeting of the society, was divided into two parts, the first dealing with experiments with steam jets, from the appearance of which the character of the steam was determined approximately, and the second giving general expressions for the instrumental errors of condensing calorimeters for testing the quality of steam. We will confine ourselves here to the first part alone which bears directly upon the published illustrations. Figs. 1 to 5, we would explain, are reproduced from photographs of steam jets under different conditions.

It will be understood that Mr. Denton's method of recognizing dry, slightly wet, or slightly superheated steam, consists in the scrutiny of a jet of steam flowing into the atmosphere. Mr. Denton explained that if a boiler can be made to generate steam which is a few degrees superheated, then by drawing off steam at the end of a pipe of sufficient length the loss of heat by the pipe may be made to so nearly equal to the amount of the superheating that the steam will issue from the pipe in exactly the saturated condition. In the case of these experiments, this method was adopted to obtain dry steam.

A 30 horse-power Harrison steam boiler, Fig. 6, was used, which, when not forced to its utmost steaming capacity, superheated its steam from 6° to 12° F. To the top of the steam space of this boiler an inch pipe, *a*, *a*, *a*, about 40 inches long was attached as shown in the figure. This pipe led to a 1½-inch tee, *b*, to which were connected the several outlets used and the thermometer and steam gauge A. At B was a stop-valve, and at C another thermometer and steam gauge. All of the pipe *a* up to the tee was heavily protected against loss of heat by asbestos paper, 2 inches of hair felt and canvas. When the thermometer C showed 8° of superheating, the loss of heat from the pipe would make thermometer A show 2° of superheating, both steam gauges A and C showing exactly the same pressure.

By raising the water in the boiler to the top of the gauge-glass and increasing the quantity of steam generated by the boiler, the superheating at thermometer A could be made to vary from 2° F. to zero, and the steam referred to herein as dry steam was such steam as flowed through the pipe *a* when thermometer A showed less than

2° but more than 0° of superheating, with reference to the pressure common to the gauges at A and C respectively.

Experiment 1.—The tee *b* was fitted at its under side with a draining pipe terminating in a petcock. Into its ends were screwed ¾-inch pipe plugs prepared as follows (see Fig. 7): The square hub to which a wrench is intended to apply was turned off, and a hole ⅜ inch in diameter drilled through the center of the plug. A hole ⅞ inch in diameter was then drilled in the inside end of the plug, so as to leave a thickness of metal at the outer end of ⅞ inch. The ⅞-inch hole is then practically an orifice in a "thin plate," and removes the possibility of any of the heat of steam flowing through it, being employed in overcoming friction against the passages leading to the point where the steam issues into the atmosphere. Thus arranged, dry steam at 55 pounds gauge pressure flows into the atmosphere of a boiler room in a jet which is perfectly transparent over about ¼ inch of distance from the orifice. Fig. 5 shows a jet for 95 pounds gauge pressure.

Experiment 2.—For the thin orifice in the end of tee *b* there was substituted a piece of ¼-inch gas-pipe, *d*, Fig. 8, about 4 inches long, upon which was mounted a hollow copper drum, *e*, about 3 inches diameter and ¾ inch in length. On the outer end of the gas-pipe was a brass cock, *f*, 2 inches long. The bore of the pipe and cock was about ⅜ inch. The drum *e* was fitted to receive a stream of water at *g* and allow it to flow off at *h* after subjecting the pipe *d* to a certain refrigerating effect. Thermometers at *g* and *h* graduated to fifths of a degree F., determined the temperature of the water at its entrance and exit to the condenser. The thin orifice at the side of the tee shows the transparency of the "dry steam" for ¼ inch from the orifice. The jet issuing from the cock *f* is a bluish-white color clear up to the orifice, due to the cooling loss of heat in passing through the 6 inches of ¼-inch pipe and cock.

Upon passing water through the condenser so as to maintain it at an average temperature of 74½° F., the end jet became distinctly white, the jet at the side certifying by its unchanged appearance that the steam operated upon was also unchanged in quality. The heat abstracted per minute was determined to be 12.75 British thermal units. The steam flowing* per minute was determined to be 1.13 pounds. The latent heat of steam at 55 pounds gauge pressure being 822 British thermal units, 1.13 pounds of steam would possess 929 units of latent heat, which if completely absorbed by refrigeration would cause the 1.13 pounds of steam to become liquid water at the temperature corresponding to 55 pounds pressure. Hence the absorption by the circulating water of the 12.75 British thermal units may be assumed to cause $\frac{12.75}{929} \times 100 = 1.4$ per cent. of the steam to liquefy.

Fig. 1 shows the effect of circulating iced water through the cooling drum, thereby maintaining it at an average temperature of 54° F. The heat abstracted per minute was 18 British thermal units, the flow of steam was practically the same, so that the view exhibits the appearance of a jet of steam at 55 pounds pressure containing 1.94 per cent. of liquid water. A jet at 95 pounds gauge pressure being maintained at 76° F., 26.27 thermal units were abstracted from it per minute, and the flow of steam was 1.75 pounds per minute. Fig. 2 exhibits the appearance of this jet, which by the above data contains 1.88 per cent. of water.

*This was determined by attaching cock *f* to a Wheeler surface condenser, S, and determining the flow for a period of about half an hour, and weighing the condensed steam by a spring balance, K.

FIG. 1.—Steam at 55 Pounds Pressure Containing 1.94 per cent. Water.

FIG. 2.—Steam at 95 Pounds Pressure Containing 1.88 per cent. Water.

FIG. 3.—Steam at 55 Pounds.—Boiler Priming Violently.

PHOTOGRAPHIC REPRODUCTIONS OF STEAM JETS.

FIG. 4.—Dry Steam after Traversing 100 Feet of Covered Pipe at Velocity of 50 Feet Per Second.

FIG. 5.—Dry Steam at 95 Pounds Pressure.

PHOTOGRAPHIC REPRODUCTIONS OF STEAM JETS.

Experiment 3.—Jets of dry steam at 55 pounds being uniformly flowing, the level of the water in the boiler was gradually raised beyond the top of the water-glass until the water was about 8 inches from the top of the steam space of the boiler, when periodical gusts of white mist commenced to occur in both the end and side jets, and engines taking steam from the boiler received so much water in their cylinders that they could no longer run with safety. A view of one of such gusts was made by magnesium flash light with the result shown in Fig. 3. While the feed pump was working, the priming denoted by these gusts continued. The jet returned to steady action and normal appearance within a few seconds after the feed pump was stopped, notwithstanding that the boiler was almost completely full of water.

Experiment 4.—The boiler being steadily making steam 8° superheated and supplying the same to an engine through about 100 feet of 2½-inch pipe, newly felted with 1 inch thickness of hair felt, a jet of steam was made to blow through a petcock about 2 feet above the throttle valve on

the investigation that jets of steam show unmistakable change of appearance to the eye when steam varies less than 1 per cent. from the condition of saturation either in the direction of wetness or superheating.

The mathematical investigation showed that the instrumental error of portable condensing calorimeters does not theoretically interfere with the measurement of about 1 per cent. of variation in the heat of saturated steam. But in the use of such calorimeters there has always been found to exist an accidental variation or error considerably in excess of the theoretical instrumental error, even Regnault's magnificent work not being an exception in this respect. Consequently if a jet of steam flow from a boiler into the atmosphere under circumstances such that very little loss of heat occurs through radiation, &c., and the jet be transparent close to the orifice, or be even a grayish-white color, the steam may be assumed to be so nearly dry that no portable condensing calorimeter will be capable of measuring the amount of water in steam. If the jet be strongly white the amount of water may be roughly judged up to about 2 per

which she is helping to replace. With a length between perpendiculars of 175 feet, a breadth of 31 and a mean draft of not quite 12, the Petrel will be supplied with engines of about 1850 indicated horse-power under freed draught, with which she will probably attain a speed of about 13 knots. This machinery is now ready for her, so that it is thought that she will be complete for trial within from two to three months. Like the other new vessels, she is provided with a curved steel deck for the protection of her engines and boilers, and is also divided by steel bulkheads into numerous water-tight compartments, so as to minimize the injury done by the penetration of shot. Her main battery consists of four six-inch, high-power, steel breech-loading rifles, so mounted in sponsons as to have a widesweep. She will also have a secondary battery consisting of two revolving cannon, two rapid-fire guns and a Gatling. She will have a barkentine rig and sail power for ordinary cruising where steam is not required.

Compared with the Charleston and the Baltimore, the Petrel is seen to be a small craft of inferior speed. But her cost is

Fig. 7.—Details of Side Orifice.

Fig. 6.—Elevation of Test Plant.

THE IDENTIFICATION OF DRY STEAM.

the steam chest of the engine. Fig. 4 shows the appearance of the steam when the engine was running with a total steam consumption of about 600 pounds of steam per hour. The jet 4 was so laden with water that it flowed with irregular gusts, resembling those occurring when the boiler was priming (Fig. 3), but of less violent character. And yet the boiler was making slightly superheated steam, as proven both by the thermometer at C (Fig. 6) and the transparent appearance of the jets from the apparatus at the boiler. The explanation of this paradox is as follows: The steam pipe to the engine runs beneath the engine foundation from the boiler to a point below the vertical pipe B; thence it rises in B, and finally runs vertically downward to the engine in A. When the engine is stopped, the water condensed by the pipe remains at the bottom of B, and the jet contains only a gray mist. When the engine is running, the water of condensation is swept along with the steam with sufficient power to cause it to be carried up B, and show the wetness of Fig. 4. A valve placed at the lower end of B to drain the water out of the pipe will prevent the wet appearance of the jet in Fig. 4 when a feeble current is passing through A and B, but such drainage fails sensibly to alter the appearance in Fig. 4, when the velocity through the pipe is 50 feet per second.

We will repeat here the conclusions at which Mr. Denton arrived: It appears from

cent, but beyond this a calorimeter only can determine the exact amount of moisture. A common brass pet cock may be used as an orifice, but it should, if possible, be set into the steam-drum of the boiler and never be placed further away from the latter than 4 feet, and then only when the intermediate reservoir or pipe is well covered.

The Gunboat Petrel.

Following the Yorktown, the Vesuvius, the Charleston and the Baltimore, the fifth of the vessels added by Secretary Whitney's administration to the new navy, the Petrel, was recently launched at the yard of the Columbia Iron Works, at Baltimore. The name, one of the prettiest and most suitable that could be given to a small vessel, is not wholly new to our navy, although, we believe, never before conferred in it on a craft expressly constructed as a warship. It was borne both by a small schooner, built like the present vessel in Baltimore, and employed in the Mexican war, and also by a steam vessel purchased from the merchant marine and fitted up with a battery for service in the civil war. But the new Petrel, though having a displacement of only about 885 tons, and classed in the legislation authorizing her construction as a light gunboat, is an effective cruiser, built on an approved modern plan, and capable of better service than some larger vessels of the old navy

only one-fourth that of the former vessel and less than one-fifth that of the latter. It is rather noticeable that for general cruising purposes no other vessels so small have been asked for since the Petrel was authorized in the spring of 1885, and it has been suggested that she may prove to be the only one of her class, as the Dolphin will certainly be the only one of hers. Still, with her light draft and good battery power, the Petrel will no doubt find her sphere of usefulness. The new composite ship, to be used as a practice vessel for the midshipmen of the Naval Academy, will be somewhat near the size and cost of the Petrel. The Vesuvius is also of similar small displacement, but has very high speed. It cannot be long now before the Petrel and her four predecessors will join the four Roach cruisers. The coming winter will probably see the Yorktown, the Vesuvius, the Charleston and the Petrel completed and tried. Indeed, for the future, trial trips rather than launchings will be eagerly watched for, and the results will be of value to Congress in guiding its legislation for new construction during the next session.

The rate on bar iron from the Mahoning Valley, Ohio, and the Shenango Valley, Pa., to Memphis, Tenn., has been reduced 2 cents per 100 pounds. The new rate went into effect on Saturday, the 20th inst., and was made at the request of the New York, Pennsylvania and Ohio Railroad.

THE MECHANICAL ENGINEERS'

SCRANTON MEETING.

Second Notice.

The afternoon of Wednesday, October 17, as outlined in our report last week, was again devoted to excursion to different establishments in Scranton. The first stop was made at the locomotive shops of the Dickson Mfg. Company. The various stages in the erection of locomotives were there exhibited, considerable attention being attracted by the hydraulic flanging of locomotive boiler heads. Other departments of the works, such as the engine erecting shop and the foundry, were also visited, a large Wheelock engine in course of erection in the former exciting particular interest. A special invitation had been issued to visit the works of the Scranton Packing Company, where a refrigerating plant of the absorption type was being tested. The machinery there was examined with a good deal of interest. Perhaps one of the most novel experiences during the trip was the descent into the Pine Brook Colliery and the ascent into the coal breaker. The mine shaft is nearly 300 feet deep. Carriages then conveyed a large number of the party to the works of the Boies Steel Car-Wheel Works. The wheels there turned out consist of cast-iron hubs and steel tires, the wheel disks each being made up of two steel plates securely bolted together, the whole making apparently a very substantial and elastic wheel. The wheel disks are of a peculiar shape calculated to give great resisting power, and are formed in a hydraulic press. All the details of manufacturing the wheels were exhibited and attentively followed.

Wednesday Evening.

The evening session was opened by a paper by Prof. J. Burkitt Webb, on the "Overhauling of a Mechanical Power." Professor Webb undertook to show that there was no such law, or its converse, as that proposed by Professor Ball in his "Experimental Mechanics," in which the following statement is made: "The principle which we have here established (with respect to a differential pulley block) extends to other mechanical powers, and may be stated generally: Whenever rather more than half of the applied energy is uselessly consumed by friction, the load will remain suspended without overhauling."

The paper was briefly discussed by Mr. Oberlin Smith, and was followed by Professor Webb's second paper on "The Mechanics of the Action of the Injector." To this we will refer more in detail in another issue. In the resulting discussion, a communication was read from Mr. Wm. Kent, who took the stand that, while the injector was a poor machine for lifting water, its efficiency was almost perfect, so far as forcing water into a boiler was concerned. Comparing the efficiencies of pumps and injectors, Mr. Denton pointed out that in a pump where there was practically no expansive working of the steam the performance was much superior to the work of an injector, even though for this latter a card might properly be drawn showing a much greater available area of work done.

We omitted to state last week that among the papers presented and discussed on Wednesday morning was one by Mr. F. A. Scheffler, entitled, "A Foundry Cupola Experience." This was a continuation of a paper by the same author, presented at the Nashville meeting of the society, its purpose being to answer the questions raised in discussing it at the time.

In discussing this paper, Mr. W. F. Durfee referred to the waste of fuel, in the

shape of carbonic oxide gas, ordinarily going on in foundry cupolas. This, he explained, was overcome in a new type of cupola by the introduction of a set of auxiliary tuyeres which introduced air at different levels and prevented carbonic oxide from again forming, due to the presence of coal.

Wednesday evening having been specially set down for the discussion on "Steel Phenomena," this subject was then taken up and is presented at length elsewhere in this issue. The session was adjourned at 9.30 p. m. so as to enable the visitors to avail themselves of the invitation extended by the Suburban Electric Railroad Company to go over their electric road, three special cars having been provided for the purposes. It is not without interest to note here that Scranton was the first city east of the Mississippi to build a street car road to be operated exclusively by electricity. Commencing with a capital of \$20,000, and 3 $\frac{1}{2}$ miles of track in December, 1886, the Suburban Company now have over 5 miles in operation, with 20 cars. The first cars were built by the Pullman Company, and were considered at the time the finest street cars in the world. One of them was the show car of the Pullman Company at the Paris Exposition. The success of the Suburban has been followed by the forming of other companies. The Nay-Aug Crosstown commenced running last spring, the South Scranton Passenger Railway this fall. The People's line will soon be changed from horsepower to electricity, when Scranton will have about 25 miles of street railroad operated by electricity.

Thursday, October 18,

was given up wholly to an excursion, a special train leaving Scranton at 9 a. m., having been kindly provided on the Erie and Wyoming Railroad. The first stop was made at Hawley, the silk mills at that place having been thrown open for inspection. The mills are operated by water power and furnished a series of interesting studies. Leaving Hawley the train proceeded to White Mills, where the Honesdale Glass Works were visited. After dinner, which was served at Honesdale, the party were conveyed by the gravity cars of the Delaware and Hudson Company over the Moosic Mountain to Carbondale and back to Scranton through the Upper Lackawanna coal field. The pleasures of this journey at this time of the year, with the wooded mountains in full autumnal glow, can scarcely befitly described, but must be experienced to be fully appreciated. Indications of the great wealth of coal in the region passed through are generally prevalent. In this connection the following short table of coal shipments will, no doubt, be examined with interest:

Coal Shipped from Lackawanna-Wyoming Valley.

	tons.		tons.
1880	11,419,279	1884	15,977,753
1881	13,951,333	1885	16,236,470
1882	18,971,371	1886	17,081,826
1883	15,604,422	1887	19,684,929

The output for the Wyoming region thus far this year, according to the Scranton Board of Trade, is 16,141,451 tons, being now 2,000,000 tons a month. At this rate the output would be over 25,000,000 tons, or fully two-thirds of the entire anthracite product for the year. Every strike in the Lehigh and Schuylkill regions has helped Scranton. To mine this coal, over 50,000 men and boys are furnished steady work the year round, and the companies pay out fully \$4,000,000 cash each month in wages. With such a steady flow of wealth circulating through the arteries of this valley monthly, is it any wonder that its capital city must grow? The magnitude of the coal trade is more easily seen by reducing it to daily proportions. During the month of September there was sent out from the Wyoming

Valley each working day 156,653 tons, equal to 522 trains of 20 cars each of 15 tons capacity. The increase has averaged about 1,750,000 tons yearly.

Though not in accordance with the original programme it was decided to hold

An Evening Session,

thus leaving Friday free so far as the consideration of professional papers was concerned. The session was presided over by Mr. Henry G. Morris, the first business being a number of announcements relative to an invitation which had been received to visit the Scranton Steel Works. The first paper was by Professor Hutton on

THE STRAINS ON AN ANNULAR LID RESISTING INTERNAL PRESSURE.

It appears that the occasion recently arose in Professor Hutton's practice to decide upon the strains in an annular casting, to which a flexible diaphragm was secured, when fluid pressure came normally upon the latter. A large cylindrical vessel, 73 inches in diameter, had to have a lid which could be easily opened, and should be light. It was therefore decided to make this lid of copper sheet, $\frac{1}{4}$ inch thick, and to rivet this copper to a cast-iron ring, which would give the necessary stiffness to secure a steam-tight joint when bolted to the flange of the cylinder, and would allow of arranging a convenient hinge structure.

The interest of such a case to designers generally, and the advantage which it may prove to others to be able to refer to such an analytical investigation, induced Professor Hutton to request Mr. L. H. Rutherford, by whom it was undertaken, to consent to its publication in the society's "Transactions." The paper, we need perhaps scarcely say, was eminently mathematical in character.

There being no discussion, Mr. C. J. H. Woodbury's paper on "Electric Welding" was taken up. To this we referred more fully in our last issue. The paper, we may add here, embraced extensive tables of tests of welded specimens made at the Watertown Arsenal. The machines by which the welding is done were illustrated and described in *The Iron Age* of July 12, 1888. Mr. Woodbury showed a number of very interesting specimens illustrating the capabilities of the process. It may not be amiss to remark here that the Thomson Electric Welding Company, of Lynn, Mass., are applying it largely, and with eminent success, to the welding of carriage-wheel tires.

The discussion was opened by a written communication from Mr. Wm. Kent, who desired to know how it was that a ring could be welded, the natural inference being that the electric current would pass through the unbroken part of the ring in preference to taking the shorter path, embracing the resistance of the disjointed ends. Mr. Woodbury explained that as a matter of fact the greater portion of the current, depending upon the position of the clamps of the welding machine, took the shorter path regardless of the great resistance. Rough figures were given by Mr. Woodbury for the different values, the general nature of the question and the short time at disposal in replying preventing an exact statement. Mr. Oberlin Smith referred to the fact that he had successfully welded together pieces of tin plate, though the action in that case ought perhaps more properly be termed soldering, since the tin coating merely melted, and, on again solidifying, bound the pieces together. Mr. Smith referred also to the possible utility of the electric process in locally heating steel tools for hardening, especially where the parts to be hardened are small projections of relatively very large pieces, as, for example, the cutting points in dies, thus entailing danger of fracture from unequal expansion and con-

traction in the ordinary process. Attention was further directed to the circumstance that in butt-welding by the electric method the ends of the pieces to be joined were made convex; consequently, the union began at the center and proceeded outward, the flux being forced outward at the same time. Mr. Pope drew attention to the great utility of electric welding in joining electric wires, the union in all cases being perfect and immeasurably superior to the method in current use of twisting together the ends of the wires to be joined and then soldering. Incidentally he touched upon the question which had been raised as to whether iron and steel would be subject to burning when welded in this way, and stated substantially that there was no danger from this source, the temperature being under ready control. Mr. Woodbury, in closing the discussion, spoke, among other things, of a contemplated chain-making machine which would embrace an electric welding attachment.

The list of papers having been exhausted, topical discussions were again taken up,

No agreement exists among the members as far as the prices of Nuts of a certain size are concerned. This is known as a base rate, and includes all products between certain numbers. Nuts below or above this scale are termed extras, and their selling price is not regulated by agreement. As a consequence, there is considerable cutting down by manufacturers in the price of extras. The principal subject of discussion related to this cutting of prices. An effort to regulate the price for the products of all sizes was made by a number of the members. The attempt failed for want of unanimity as to what the fixed rate for each size should be.

New Turret Lathe.

The Hendey Machine Company, of Torrington, Conn., are putting on the market a new 15-inch turret lathe, shown on this page. The lathe is designed to take the place of a more expensive screw machine for a large variety of work. The turret

NEW TURRET LATHE, BUILT BY THE HENDEY MACHINE COMPANY, TORRINGTON, CONN.

the first being that relating to steel phenomena, which, as previously noted, had been commenced at a preceding session. In view of its consideration elsewhere in this issue we will not here refer to it further. A series of topics on power molding machines, bucket curves of modern turbines, speeds of hot-air engines and variation in pitch of screw threads as cut by dies in screw machines were presented but elicited practically no discussion.

A series of resolutions of thanks to the various organizations and committees who had extended courtesies and generally interested themselves in behalf of the society, and its guests closed the meeting. On Friday morning a visit was paid to the Scranton Steel Works. About 120 members were in attendance during the week. The papers and discussions, as usual, were interesting and profitable, and the different excursions were thoroughly enjoyed.

The Bolt and Nut Manufacturers.—The Bolt Manufacturers' Association of the United States held a meeting at the Hotel Anderson, Pittsburgh, on Wednesday, the 17th inst. The Nut Manufacturers' Association met at the same place the day previous. The members of one are also members of the other, but each organization is independent of the other.

side is moved by a lever and has a movement of 6 inches. The turret is revolved by drawing the stop-pin on the side and turning by hand, which is done as quickly as a full automatic turret, and, in some cases, quicker, as it is not necessary to pull the slide back as far as when on small work. The turret slide is also moved by a hand-wheel and screw and is set in the following manner: Take off lever and draw the slide back as far as possible. Tighten the nut on side of foot-block and it is ready for use. This makes a complete hand or speed lathe. The turret has six holes; the cut-off slide has two tool-posts and has adjusting stops for each tool. The turret slide also has an adjusting stop. The spindle has a $\frac{1}{4}$ -inch hole through its entire length and front, and has a Morse taper for center. The boxes are of deoxidized bronze and the spindle is furnished with a face-plate. The weight of the lathe is 700 pounds and the bed measures 5 feet.

The regular monthly meeting of the Bessemer Steel Association was held at the Monongahela House, Pittsburgh, on Tuesday, the 17th inst. The attendance was fair, more than half the members being represented. Business was reported to be in a very satisfactory condition and the

outlook very encouraging. No change was made in prices, nothing but routine business being transacted.

Treasury Decisions.

DUTY ON ADJUSTABLE CHAIN LINKS.

The claim of certain appellants that shackles or chain links are dutiable as malleable iron castings at 2 cents a pound and forgings at $2\frac{1}{2}$ cents a pound instead of 45 per cent. is denied by the Treasury Department, on the ground that the articles in question, which are links for chains with movable bolts, so that the chains can be separated and adjusted by shortening or lengthening, are made wholly of iron, being first forged in a suitable size and shape and then manufactured and finished by further process of boring, &c., after which they are either japanned or galvanized, and that they are not now in the condition known as "forgings of iron."

NAIL FILES.

In a case of nail files the appellants claim that the articles in question are dutiable at the rate of 30 per cent. ad valorem, either as "brushes," under the provision therefor, or by assimilation to "manufactures of bone." The articles it appears were returned by the appraiser as "manufactures of metal and bone," and classified for duty under the provision for "articles * * * composed wholly or in part of * * * metal," which view has been sustained.

BEELTON SHANKS.

Having been assessed at 45 per cent. and the appellants claiming 25 per cent. duty as buttons, or at the rate of 35 per cent. ad valorem for "plated and gilt articles and wares of all kinds." * * * The appraiser reports that the articles commercially known as button-shanks are not button-molds, but small brass cups into which the molds are set in the manufacture of buttons, and which are not of the same character as the "shanks and collets" covered by the Department's decision of May 31, 1888, and are not plated or gilt articles. The assessment of duty is affirmed.

MANUFACTURES OF STEEL.

On an assessment of duty at the rate of 45 per cent. ad valorem on certain so-called "steel forgings" claimed by the appellants to be dutiable at $2\frac{1}{2}$ cents per pound, as forgings of steel, and returned as manufactures of steel. It appears that the merchandise in question consisted of steel wire drawing-plate blanks, which were plates of steel that had been forged into the sizes and shapes desired preparatory to their further manufacture and completion for use as "drawing plates," but had not undergone any such further manufacture. The Department reversing the assessment says: These goods not having been advanced by manufacture beyond the condition of forgings are dutiable as claimed by the appellants.

The Meldometer.—The meldometer, invented by Mr. John Joly, of Dublin, Ireland, is a simple instrument for observing the behavior of bodies at high temperatures, melting points, &c. The instrument fits the stage of a microscope, and consists of a platinum strip stretched between two clamps; a little of the material in a state of powder is put on the strip, a current is sent through it, and the resistance of the system adjusted until melting or boiling ensues. A carbon rod of more than a foot in length is placed vertically in a glass tube, and mercury enters the tube from below when a small reservoir connected with the tube by a piece of india-rubber pipe, is lifted; thus part of or all the carbon is cut out. A tap further serves to arrest or discharge the mercury. It is easy to melt quartz and other refractory material on this platinum strip.

THE WEEK.

An explosion occurred in the great manufactory of the American Pencil Company, in Jersey City, last Saturday. It was caused by the spontaneous combustion of red cedar wood dust, which, passing through the dust arrester, flew from the sawing room to the boiler room. There was a sharp explosion as the flue burst, and the flames flashed 300 feet into the sawdust heap in the boiler room. About 400 girls and men who were at work in the building escaped, with a single exception. The damage is estimated at \$1200.

Pine straw bagging, made from the needles or leaves of the pine tree, finds favor among merchants and shippers at Charleston, and it is predicted that before another season 100 factories will be engaged in its manufacture.

A federation of miners of the Lake Superior district, including men of copper, iron and all other mines of Northern Michigan, Wisconsin and Minnesota, is now being organized.

Japan has nearly 100 daily newspapers. The first was started only 18 years ago.

A new street car motor run with gas made automatically from crude petroleum was exhibited in Chicago last week. The inventor claims that it is capable of a speed of 15 miles per hour, at a cost of less than \$1 per day.

To remedy a quicksand on the West Shore Railroad in what is called the West Point tunnel, Chief-Engineer Katta is putting steel ribs and plates into the excavation for a distance of 140 feet, the former 15 inches wide and the latter 24 inches.

Favored by President Diaz, a New York syndicate have obtained control of the Mexican Mortgage Bank, the President being desirous of attracting American capital rather than European.

Some interesting statistics of the paper trade were given by Warner Miller in an address delivered at a banner-raising in Duane street about a week ago. The paper trade in this country represents a yearly product of nearly \$95,000,000, and the articles made, of which paper is the so-called "raw material," amount to nearly \$100,000,000 yearly. The value of paper is largely made up by the cost of labor in making it, for the various articles from which paper is produced will not average 25 per cent. of its total cost. The duty on writing and fine paper was 35 per cent. to the year 1883. It was then reduced to 25 per cent. See the result. For the fiscal year June 30, 1883, \$55,448 worth of paper was imported, paying a duty of \$19,407; while for the year ending June 30, 1887, there was imported \$968,865 worth of paper, paying a duty of \$242,216—an increase of \$222,809 in duty paid, and about \$915,000 in value, or nearly 1700 per cent. in value and 1200 per cent. duty—a tremendous increase in four years.

A report from Mexico says American capitalists are about to introduce machinery for decorticating the ramie and cotton stock fibers of that country, and that, in consequence, Mexican estates will be enhanced in value.

The Select Council in Philadelphia has voted in favor of elevated railroads in that city, which is supposed to insure the success of the measure.

In response of the recent letter of General Master Workman Powderly, requesting an expression from local assemblies of the Knights of Labor on the necessity for Congressional legislation in regard to trusts, Local Assembly 1233, of Baltimore, sent a letter to President Cleve-

land. This letter asks him to send a message to Congress demanding immediate legislation to abolish all institutions that gamble in food, and, as a further protection to the masses, that all "trusts" be abolished. "We ask this action of your Excellency," says the letter, "as law abiding citizens, that there may not be a repetition of what has occurred when the people felt the oppression of organized bodies of avaricious individuals, who too often have been fostered and favored by representatives abusing the confidence of the people by favoring a class, to the exclusion of the people at large."

The Builders' Exchange, of Pittsburgh, has appointed a committee for the purpose of selecting a site for the erection of an exchange, to cost in the vicinity of \$200,000. The building will be modeled after the plan of the Philadelphia, Boston and Chicago Exchanges. The basement will contain a trades school for the education of boys to be carpenters, painters, masons, bricklayers and all the arts appertaining to the building trades. The first floor will be a bank for the benefit of contractors, builders and architects. The second floor will be the exchange proper, where contractors and architects can meet and make agreements and where property owners can come and see about the erection of buildings. The third floor will be for the meetings of the exchange.

The magnates of the Southern Pacific and Central Pacific railroads are proposing to bridge the Carquinez Straits, an arm of the Suisun Bay, near San Francisco, and thus effect an entrance into the city without depending upon the big transport that now plies between Benicia and Port Costa, carrying trains from one side to the other. The exact location for the bridge has not yet been decided.

One of the jurors of the Brussels exhibition says American agricultural machines received "three diplomas of honor—the highest award—and one gold medal; in other words, there was awarded a diploma of honor for each exhibitor but one, and he really only deserved the gold medal. The other exhibitors fared equally well, for out of 73 *exposants* 54 got distinctions of greater or less degree. I think we have reason to congratulate ourselves."

The decision of the United States Court in Philadelphia adverse to the interests of silk manufacturers, by classifying ribbons among hat materials, and therefore subject only to a low rate of duty, excites severe comment. The manufacturers receive encouragement from the assurance from Washington that "it is the intention of the Department, as at present administered, to protect the revenues of the Government from loss by maintaining the classification which it has always insisted upon—namely, that these goods should pay duty at the rate of 50 per cent. ad valorem, and not at the low rate of 20 per cent. prescribed for hat materials, believing that when the question can again be brought before the Supreme Court the construction of the Department will be upheld."

The rapid growth of the Western Territories is shown by the annual reports just received in Washington. L. K. Church, Governor of Dakota, reports an increase gain in the population of the Territory during the year of 73,346 in a total population of 640,823. The quantity of land purchased for settlement was 2,500,000 acres. As to the discovery of tin in the Black Hills the Governor remarks that there is not to-day a producing tin mine nor a pound of Dakota tin in the markets. E. G. Ross, Governor of New Mexico, in his annual report says the questions of the settlement of land grant titles, water storage and irrigation are of the foremost importance to the development and future welfare of the

Territory. He says that of the 79,000,000 acres, the area of the Territory, 60,000,000 may be classed as tillable with proper irrigation. The facilities of the Territory for storing water are unsurpassed. The present system of independent ditching must be abandoned and the Territorial government must assume jurisdiction of the water supply and its distribution. The population of the Territory has increased during the year about 10,000. The aggregate value of the taxable property in the Territory is given as \$43,151,920. Of this amount \$15,370,960 is in livestock, \$7,466,869 in lands and \$8,858,350 in houses and improvements. Edward A. Stevenson, Governor of Idaho, estimates the population of that Territory at about 100,000. The value of taxable property is given at \$21,288,892, which, his report says, is less than one-half of its actual value in cash. About 460,000 acres of public land have been entered during the year. The agricultural productions for the year comprise 2,986,000 bushels of wheat and estates are valued at \$2,800,000. A report from the United States Assay Office, at Boise City, shows the gold, silver and lead production of the Territory for the year to be \$8,905,136, of which the gold was \$2,522,209, the silver \$3,422,657 and the lead \$2,960,270.

Every modern man-of-war is now provided with powerful electric searchlights. They are of the arc pattern, usually ranging from 8000 to 30,000 candle-power, so arranged with reflectors that their rays can be concentrated into a single beam and thrown in any desired direction. With one of these lights of only 8000 candle-power no difficulty is experienced in illuminating a target more than two miles distant, rendering firing at night as easy and accurate as by day.

A "corner" in the diamond market is spoken of as possible if the four diamond fields in Africa could be worked as one concern. It is even declared that a combination will be necessary, on account of the glutted state of the market, as present values very nearly touch the cost of production. It is even possible, we are told, that the costly gem may be found in many fresh places and become so common that it will not pay to mine, unless some fresh use should be found for it similar to that for boring purposes—some practical use, in fact, that will consume a great many stones and keep up the price.

The explosion of the oil-tank steamer Ville de Calais, employed in the oil trade between Philadelphia and Calais, excites much interest in shipping circles, particularly among agents and captains identified with sailing vessels, who argue that further explosions will put a decided check upon the building of steamers to compete with them. Respecting the cause of the explosion, one of the parties interested says: "The tanks must have been full of gas, left after the 15,000 barrels of petroleum which she carried had been pumped out. And then there must have been carelessness in examining the tanks. The first thing done after emptying the tanks is to fill them with water. The petroleum still remaining rises on top, and, when the tanks overflow, runs out. It is then that the tanks are examined, and in doing this the same safety lamps are used that are used in mines. Even after the tanks are empty, if a careless sailor, after lighting his pipe, threw the match down the hatch, just such an explosion as rent the Ville de Calais asunder might ensue."

The Treasury Department has decided that a vessel cannot be legally regarded as having arrived at New York upon a given date upon evidence that she had passed Sandy Hook or Quarantine on the day in question. Adopting the opinion of the Attorney-General upon this subject, the

port of New York only includes so much of the water adjacent to the city as is usually occupied by vessels discharging or receiving their cargoes or lying at anchor and waiting for that purpose. This definition necessarily excludes the waters adjacent to Sandy Hook from the limits of the port.

Chauncey M. Depew professes to believe that the prospects for railroad building are not good. The compulsory schedule made by the Iowa Commission "will not allow the railroads to make a penny." Besides, the proposition to reduce the tariff on steel rails, he says, causes railroad constructionists to delay work, in the expectation of buying materials cheaper than now. Even cheaper iron, in his view, would not accelerate railroad building, because railroads are useless unless there is business for them.

Iron bridges are being removed on the Pennsylvania Railroad, on account of their being too light for the heavy locomotives now employed and because stone bridges are considered more durable and more substantial.

R. M. Hunt, of New York, was re-elected president of the American Institute of Architects.

The preliminary statements of exports from the United States during September show that our wheat exports for the last nine months are less than half as great as for the corresponding months of 1887; our flour exports for 1888 fall little behind those of 1887, however, and largely exceed those of 1886. Our corn exports for the nine months fall behind those of 1887 by more than 6,000,000 bushels; but for the last three months they have exceeded in aggregate the corn exports of the same three months of 1887 by nearly 4,000,000 bushels. The comparisons of values of three items of breadstuffs exports for September are as follows:

	1888.	1887.
Wheat.....	\$5,318,835	\$4,701,860
Flour.....	4,405,652	5,351,812
Corn.....	1,824,228	926,628

The quantities compare as follows:

	1888.	1887.
Wheat, bushels.....	5,801,321	5,318,830
Flour, barrels.....	939,564	1,172,347
Corn, bushels.....	3,455,970	1,873,721

Last year the preliminary export statements for September were increased by \$18,200,000 by the final and complete returns. If the same increase is to be relied upon this year, the aggregate September reports will be shown to have been \$50,400,000. The imports for September, 1887, were \$56,009,735.

The exports from San Francisco to Australia for the past three months exceeded in value \$500,000, and the year promises to be the best in that trade California has ever had. The exports as above consist principally of lumber, doors, canned goods, salmon, broom corn and machinery.

The Venezuelan Government has entered into a contract for the introduction of French immigrants, apparently with the object of checking British encroachments.

The process of "electric sugar refining" is as great a mystery as that of the Keely motor. As long as it is conducted in "secret rooms" no outsider can form an intelligent opinion on the failure or success of its extraordinary claims.

The Lighthouse Board will ask Congress to prohibit the use of lights which are dangerous to navigation, the special reference being to those on the Brooklyn Bridge.

The Russian Government has under consideration a scheme designed to extend the oil trade in the Baku region, near the Caspian Sea. At present the oil has

to be conveyed either by tank cars over the railway from Baku to Batoum and then transhipped, or by tank steamers through the Caspian and up the Volga, from a point on the latter river being conveyed to its destination by railway. The plan now contemplated is to connect the rivers Don and Dnieper by means of a canal, deepening at the same time the bed of the Volga. This would permit the tank steamers to pass all the way by water from the Caspian into the Black Sea, and thence, of course, to all parts of Europe, while by means of the rivers the interior of the Empire could also be reached. It is said there are no engineering difficulties in the way.

The Copper River country in Alaska has been carefully explored during the past season by parties who have just returned, and report the discovery of an abundance of good coal. At Four Rivers, according to the *Juneau Mining Record*, of September 20, "there are immense quantities of coal in this section exposed to view. The creeks in many places run in beds of solid coal, and in some places it is hard to find good anchorage on account of the bottom of the bay being nothing but coal."

R. J. McConnel, of the Canadian Geological Survey, has just returned from the Yukon River. The region, he says, is a vast gold and silver bed. Gold can be seen with the naked eye in ledges along the banks of the stream. On the Alaskan side they have erected works where 190 heads of stamps are in operation. The gold yields \$30 to the ton.

Extensive new iron works are contemplated at Cairo, Ill., and Paducah, Ky. A Pittsburgh paper says Capt. S. S. Brown, of that city, has purchased a large tract at Cairo, with this object. One of the parties interested said: "Cairo is one of the best distributing centers on the continent to-day. Aside from the navigable waterways, there are the great railroad facilities. The city is 286 miles from Chicago, and therefore convenient to the great iron ore mines of Lake Superior. It is 200 miles from St. Louis, and a central point between the prosperous East and the growing West. Aside from the Lake Superior ores, there are the Tennessee ores, slightly inferior in quality, but still good, and at High Tower, near the city, as fine limestone as can be found in the United States is to be had in large quantities. I understand that one of the most extensive iron manufacturing firms in St. Louis has decided to locate large works at Paducah, Ky."

The test suits of John W. S. Earnshaw and Naylor & Company against Collector Cadwalader, of Philadelphia, to recover alleged excess of duty on importations of iron ore, resulted in a verdict for the defendant in the United States Circuit Court. If the complainants had gained their point a precedent would have been established, under which the Government would have been required to refund large sums of money as excess of import duties to various importers of iron ore. The question in dispute was whether, under the Tariff act of 1883, which assesses a duty of 75 cents per ton on iron ore, the Collector could not be compelled to make an allowance of about 10 per cent. for the moisture contained in the article. The verdict practically determines that no allowance for moisture should be made. The suits attracted widespread attention, and arrayed the producers of the domestic article against the importers of African and Spanish iron ore.

The Brotherhood of Locomotive Engineers, in session in Richmond, Va., on Saturday re-elected the following officers: Third Grand Engineer, J. R. Spragge, of

Toronto, Canada; First Grand Assistant-Engineer, H. C. Hayes, of Cleveland, and Second Grand Assistant-Engineer, A. M. Cavener, of San Francisco. Executive Committee, Edward Kent, of Jersey City; R. M. Clark, Denver, Col.; Edward Tinsley, Hamilton, Ont.; Wm. Johnson, Rock Island, Ill., and J. F. Regard, Atlanta, Ga. A resolution was adopted indorsing the action of Chief Arthur in all matters pertaining to the Brotherhood since the last session. This virtually sustains Chief Arthur's action in the "Q" strike. The next convention will be held in Denver, Col.

Railroad officials have inspected the terminals on Staten Island in anticipation of the opening of Arthur Kills bridge, which is now nearly completed.

Another big telescope, dwarfing the instrument in Lick Observatory, is proposed by the University of Southern California. Perhaps in co-operation with Harvard University, a glass will be made 42 inches in diameter, as compared with 34 inches, the size of the Lick glass, and the effect will be to bring the moon within 60 miles of the earth, as it would appear if viewed by the naked eye. Mr. Clark estimates the cost of the glass and the mounting at \$100,000.

The assassination of two paymasters near Wilkesbarre, Pa., in order to obtain the money they carried, raises the question whether it may not be necessary to adopt some other system of payment than that heretofore followed in the mining regions for the payment of miners and railroad laborers. Many thousands of dollars are sent from the banks weekly to coal-mining centers, and from there distributed by paymasters to various little settlements in the mountains. The men charged with this duty often have to drive for miles over wild and sparsely settled regions; their mission is well known, as also the time of their coming and the fact that they have large sums with them in small notes, that cannot readily be traced or identified.

The Manhattan Elevated Railroad Company have paid into the City Treasury \$275,000 taxes for 1887. The road sought to avoid the payment of taxes on \$19,000,000 of stock. The matter went into the courts, and the Corporation Counsel declared that the untaxable bond scheme was only a ruse, and carried the case into the Supreme Court, General Term, which promptly dissolved the injunction which the road had obtained.

It is affirmed that the electrical subway in this city is seriously injured by leaks in the pipes of the Steam Heating Company. The fault in the pipes, President Andrews says, is due to the use of wooden instead of cast-iron wedges. Since its completion the company, he said, had spent over \$250,000 for repairs, and he thought further leaks were not likely to occur.

Notwithstanding her mishaps, the new steamship City of New York promises to attain extraordinary speed. As compared with the third trips of the other swift ocean steamships, the City of New York's third trip stands at the head. Following is a record of the time made by the Etruria and Umbria in the first three trips, as compared with those of the City of New York:

	Etruria.		Umbria.		City of New York.	
	D. H. M.	D. H. M.	D. H. M.	D. H. M.	D. H. M.	D. H. M.
First.....	7 18 05	7 16 25	7 11 30			
Second.....	7 2 08	8 14 12	8 12 58			
Third.....	6 22 38	6 23 25	6 15 37			

Refugees from Jacksonville were prohibited by a resolution of the Board of Health, passed 19th inst., from returning to the city until officially informed that it is no longer hazardous to do so. They promise never again to "take to the woods" to escape yellow fever.

MANUFACTURING

Iron and Steel.

M. V. Smith, of Pittsburgh, has closed a contract with the Virginia Iron and Nail Works Company, of Lynchburg, Va., for the erection of a regenerative gas furnace, with a 22-foot working hearth. The furnace will have a capacity for melting 45 tons of steel every 24 hours.

McClure & Schuler, the well-known engineers and contractors, of Pittsburgh, have received the contract for the erection of the new blast furnace of the Carrie Furnace Company, to be erected at Rankin Station, on the Baltimore and Ohio Railroad. The furnace will be erected adjacent to the present blast furnace of the Carrie Furnace Company, and will have an 18-foot bosh, and will be 80 feet in height. It will be equipped with four Massicks & Crook's hot-blast stoves, 19 feet 6 inches by 70 feet. Riter & Conley, of Pittsburgh, have received the contract for the ironwork for these stoves, while McClure & Schuler will erect everything else pertaining to the furnace. It will have a capacity of about 200 tons per day. Work will be commenced in a few days, and it is expected that the furnace will be ready for operation not later than April 1 next. McClure & Schuler have also closed a contract with the Thomas Furnace Company, of Niles, Ohio, for the equipment of the Thomas Furnace with three Massicks & Crook's hot-blast stoves, work on which will be commenced in a few days.

The Union Steel Company, of Chicago, shut down their steel works and rail mill on the 16th inst. for lack of orders. They will probably remain idle until the close of the year, unless some of their customers should desire a round lot of rails on quick delivery, which would make it worth their while to light up. These works have made a very satisfactory run since they were started up in the spring, their output of steel and rails having been very large for the time they were in operation. The blast furnaces owned by the company will be kept at work making pig iron, which will be piled up to await the resumption of the steel works.

The Chicago Forge and Bolt Company were the successful bidders for the contract for the superstructure of the Western avenue viaduct, Chicago, which was let last week. Their bid was \$17,800.

The Standard Iron Company of Bridgeport, Ohio, have just completed an addition to their plant, which in part consists of a three-high train for rolling steel and iron sheets and plates, from No. 14 to $\frac{1}{4}$ -inch in thickness, and not exceeding 50 inches in width. This train is equipped with all modern appliances, insuring economical handling of product and satisfactory execution of orders. Fearing delays in getting this part of their extension into operation, the company have not heretofore offered their product, and are now consequently able to quote prices for prompt shipment.

The National Tubular Axle Company, of McKeesport, Pa., have commenced the erection of a large stockhouse, the foundation being already completed. When this addition is completed the works will be enabled to stock up in slack times, and be prepared for supplying larger orders on shorter notice.

From a recent issue of the Youngstown (Ohio) *Herald* we take the following: "Andrews Bros. bought the site of the Niles Company's mill this week for \$3500. It consists of about 17 acres, was formerly owned by the Harris Blackford Company, and then the Niles Iron Company. The old mill was moved to Hazelton, and it is

now predicted that Andrews Bros. will put up a new bar and sheet mill. It is a surprise to many that the plant was sold, as the Niles Iron Company were not at all embarrassed and the property was worth much more money than it was sold for."

It is reported on good authority that the Millvale Rolling Mill of Graff, Bennett & Co., at Pittsburgh, which has been idle since the failure of that firm some months ago, will be started up about November 1 next by the same syndicate of creditors that is now operating the Clinton Rolling Mill and Blast Furnace. It is probable that only the puddling department of the mill will be put in operation at the start, to be followed later on by the resumption of the entire plant.

The Mahoning Gas Fuel Company has withdrawn its supply of gas from the mills of Brown, Bonnell & Co., at Youngstown, Ohio, on account of the refusal of the firm to change their furnaces so as to adapt them especially to the use of gas. When gas was introduced in the mill as a fuel the furnaces, formerly using coal, were not changed, and the gas company claim that enormous quantities of gas have been thereby wasted. It is said that more gas is wasted in the Mahoning Valley than in any other industrial section in the country in which gas is used.

The Fort Pitt Foundry, of D. W. C. Carroll & Co., Limited, at Pittsburgh, who made an assignment some months ago, will be auctioned off at an assignee's sale, on Tuesday, the 30th inst., to satisfy a mortgage for \$34,000, placed October 1, 1887, with interest in arrears. A tract of land in Braddock Township will also be sold at auction. On it are mortgages, one for \$6000, placed November 8, 1887, and another for \$5385.50, placed November 22, 1887, both with the accruing interest. W. R. Errett is the assignee, and James W. Drape the auctioneer.

The well-known firm of W. D. Wood & Co., Limited, of Pittsburgh, whose plant is located at McKeesport, Pa., have given notice of an application to the Governor for a charter for a corporation to be known as the W. Dewees Wood Company. The capitalization of the new company will be \$1,000,000, and the charter is to give the firm more privileges than under the present manner of conducting their business. At present no enlargement of the works is contemplated.

Carnegie, Phipps & Co., Limited, of the Homestead Steel Works, at Homestead, Pa., are engaged on rolling some extremely heavy armor plate for the Ordnance Department. These plates are 141 inches long, 112 inches wide, 2 inches thick, and weigh over 10,000 pounds each, with 80,000 pounds tensile strength.

The Woodstock Iron Company are excavating for the erection of large ore roasters, at their two new coke furnaces at Anniston, Ala.

P. L. Kimberley & Co., Limited, proprietors of the Atlantic Iron Works, at Sharon, Pa., and the Greenville Rolling Mills, at Greenville, Pa., have opened an office in St. Louis, Mo., with Louis McGilvray in charge. The firm's increasing trade in that section of the United States necessitated the new branch.

In the Pittsburgh papers, recently, was published a statement that Laughlin & Co., proprietors of the Eliza furnaces, in that city, had commenced the erection of a new blast furnace. We find, upon investigation, that the rumor is not well founded. It probably originated from the fact that one of the old furnaces will be blown out in a short time, and will then be torn down and rebuilt to a 200-ton furnace, which is about double the present output. The two old furnaces now

in blast have been producing on the present lining since 1882 without interruption, each furnace casting about 100 tons per day.

In a few days work will be commenced on a large addition to the works of J. P. Witherow, the well-known engineer and contractor, of Pittsburgh, which are located at New Castle, Pa. The addition, which is to be of brick and stone, will be 91 x 136 feet, with a tower 81 feet high, in which there will be offices on each of the three floors. The addition will give the machine shop almost double its present capacity.

Claire Furnace, owned and operated by the Claire Furnace Company, Limited, at Sharpsville, Pa., have been doing some good work recently. For the week ending on the 14th inst. the product was 896 tons of Bessemer iron. The best day's work during the week was 147 tons. This is the largest amount of iron ever made by any blast furnace in Sharpsville in 24 hours.

The plant of the Union Steel Nail Company, located at Omaha, Neb., is about to be removed to St. Joseph, Mo. Upon its removal it will be greatly enlarged and modernized, the present plant being but a nucleus. The style of the corporation, in order to transact business under the State laws of Missouri, will be the Union Steel and Iron Company. The following are officers of the new company: Wm. Haven, president; George T. Walker, vice-president, and W. N. McCandlish, secretary and treasurer.

The report that the Bellaire Nail Works, of Bellaire, Ohio, was making steel from metal direct from the furnace is without foundation. What gave rise to the report was the fact that the company recently made one heat from metal direct from the blast furnace. As to what may be done in this direction in the future, James Wilson, president of the company, expresses his views as follows: "Whatever we may do in using metal direct from the furnace hereafter, we are making no arrangements at present in that direction. We are very fully aware of the difficulties to be met and overcome in making the grade of steel we aim to make by the direct process, but think it possible that blast furnace practice may be ultimately so uniform as to product that the principal difficulty in using the direct process will be overcome."

The Muncie Nail Company have been organized and chartered at Muncie, Ind., with a capital stock of \$200,000, to succeed the Greencastle Iron and Nail Company, of Greencastle, Ind., and under the same management, with the following-named directors: J. F. Darnell, F. P. Nelson, Wm. H. Durham, Jas. V. Durham, and R. B. F. Pierce. The product for the present will be steel and iron nails and muck bar. The buildings for the Muncie Nail Company are completed and the work of moving the plant from Greencastle to Muncie is progressing rapidly. When fully equipped the new plant at Muncie, in point of convenience and arrangement, will be equal to the best nail mill in the country. Natural gas will afford all the fuel and light, the gas being located on the grounds of the company and controlled by them.

The Mayville furnace, at Mayville, Wis., was blown in on the 13th by H. S. Fleming, who reports that the blast was put on on the 14th, and on the 15th a cast of No. 3 iron was made. On the 17th the furnace was making two-thirds of its capacity.

The Mason ingot manipulator, which was described in *The Iron Age* of recent date, continues to do good work in the

steel plant of the Bellaire Nail Works, at Bellaire, Ohio, where it has been in successful operation for some time. For the month of September just closed the production of the steel plant was the largest in its history. The largest output in one day previous to the introduction of the manipulator was 207 tons, while the largest daily production since the introduction of the same has been 222 tons. The largest weekly run without the manipulator was 1927 tons, but since its adoption the output in one week in September reached 2003 tons. This work was performed with three men less to the turn than were employed before the manipulator was used.

Hon. John H. Bailey, assignee of the firm of Graff, Bennett & Co., has filed a petition in Common Pleas Court No. 2, at Pittsburgh, asking for permission to sell the remainder of the firm's assets to a syndicate of the firm's creditors, whose claims aggregate \$450,000. The property of the firm still in the hands of the assignee consists of several small pieces of real estate scattered throughout the country, a large number of uncollected accounts and interests in other firms, some of which are uncertain and indefinite, and others of which are in litigation. The syndicate, which is represented by James M. Bailey, James Pickands and James W. Friend, offer to pay \$50,000 for these assets, this sum to be deducted from the dividends due the creditors who form the syndicate. The assignee believes that the offer is a reasonable one, and, as it would wind up the affairs of Graff, Bennett & Co. in short order, recommends that it be accepted. A hearing on the petition will be held on November 3 next.

Machinery.

The Cleveland City Forge and Iron Company completed last week the last piece of the ponderous machinery built by them for the Puritan. It is the connecting-rod, weighing, when finished, about 21 tons. It is 40 feet long, and finishes 18 feet 6 inches diameter in the middle. Constant improvements are being made at these works. For the turnbuckle department a new brick and iron building has been erected 330 feet long by 65 feet wide. There will be four large forging machines at work in this shop. A new one is being erected that will exert a force of 6000 pounds at the point of impact. The capacity of the mill will be about 2000 turnbuckles a day. In this department is manufactured the Chapman jack, a machine which is meeting with great favor and large sales. Next year the Forge Company propose to rebuild their entire main shop with brick and iron, a very wise conclusion, as their plant is entirely too valuable to run the risk of damage by the burning of the wooden sheds now inclosing it.—*Trade Review*.

The Lewis Foundry and Machine Company, Limited, of Pittsburgh, have received an order from the American Wire Nail Company, of Covington, Ky., for the erection of a Garrett rod mill on the Anderson, Ind., gas belt. The works will cost in the neighborhood of \$200,000, and when completed will give employment to over 200 men.

The Westinghouse Electric Company announce their lease of the Consolidated Electric Light Company, of New York City, and the Sawyer-Man Electric Company, also of New York City. The Westinghouse Electric Company have had heretofore a working arrangement with these companies, by which they were able to avail themselves of the protection of the Sawyer-Man lamp patents, and to profit by the peculiarities in the manufacture of lamps covered by these patents, which had originally placed the Sawyer-Man lamp in the fore-front of the business for life, ef-

iciency and freedom from blackening, and the adoption of which processes, in connection with what are known as the Lodyguine processes, has so greatly improved the lamps now manufactured by the Westinghouse Electric Company. This lease gives the Westinghouse Electric Company entire control of these two companies. The two factories which the Westinghouse Electric Company now control under this lease—namely, the one at their works in Pittsburgh and the one on West Twenty-third street, New York City—have a joint capacity at present of 10,000 lamps per day.

Lodge, Davis & Co., Cincinnati, Ohio, report sales of from five to thirty duplicates of the various machine tools exhibited at the Centennial Exposition since the opening. Their new manufacturing plant is now complete and in full operation. The new plant is one of the largest machine tool manufacturing establishments located in the West, occupying an entire square, a portion of the building being three stories in height, while the balance is two stories.

The St. Joseph Pump Company, St. Joseph, Mo., are introducing with gratifying success to the trade the Perfection Water Elevator and Purifier, for which the company claim many points of superiority over similar constructions, chief of which is the flat-link connection used in their elevators. The cup being permanently fastened to the wire link obviates the necessity of removing it in order to lengthen or shorten the chain, as is done with all other makes. The company enjoy ample facilities for the production of their goods, consisting of a new factory building three stories high, 50x120, with a two-story addition, 75 x 50, warehouse building, 50 x 100, three stories; galvanizing and varnishing building, dry-house, &c., located just south of the city limits.

The Auburn Mfg. Company, of Auburn, N. Y., have just added to their extensive works a steam plant, to be used as auxiliary power in seasons of low water in the Owasco River. The engines consist of one pair right and left compound condensing single crank automatic cut-off of 150 horse-power each, and were manufactured by Messrs. McIntosh, Seymour & Co.

Hardware.

The nail and wire mills of the Hartman Steel Company, Limited, at Beaver Falls, Pa., are closed down at present, on account of an insufficient supply of natural gas. The Bridgewater Gas Company have the contract to supply the works with gas, but for some time past the supply of gas has not been sufficient to operate the works. This shortage will be remedied as soon as a line can be laid from the Bakerstown field, work on which is now being actively pushed.

The New Castle Wire Nail Company, of New Castle, Pa., are increasing their capacity considerably by the erection of some new machinery.

The Covert Mfg. Co., West Troy, N. Y., report an unusual demand for their full lines of specialties, obliging them to run their works to their full capacity, the month of September having been especially active. They also allude to the fact that many of the leading jobbers are now preparing their catalogues for publication, and state that the demand thus made for electrotypes illustrating the Covert goods has been greater this season than ever before.

The Bellaire Stamping Company, of Bellaire, Ohio, under date of the 9th inst., write us as follows: "Since the beginning of the current year this company has more than doubled its manufacturing capacity. The first step toward making the increase

was the purchase of the plant of the Buckeye Lantern Company, of this city. This included their letters patent, stock of lanterns, machinery, and factory building. The latter is a large, substantial brick building, built by the State for a tobacco warehouse and now used by us partly for manufacturing purposes and partly as a warehouse. We have just completed a new three-story brick building in connection with our main building, and are now changing a two-story frame building 40 x 100 feet into a corrugated iron building. The entire plant, then, consists of two brick and one iron factory buildings and one brick warehouse, all of which are considered fire-proof. The buildings are heated by the Sturtevant hot-air system and are fitted up with the most modern appliances."

Miscellaneous.

The American Leather Link Belt Company report recent sales of their leather link belting to the following firms: J. H. Horne & Sons Company, Lawrence, Mass.; Angle Lumber Company, Houston, Tex.; P. Lorillard & Co., Jersey City, N. J. Economic Gas Engine Company, 34 Dey street, New York; Remington Paper Company, Watertown, N. Y.; Heidenheimer Bros., Galveston, Tex.; Travers Bros., 556 West Fifty-second Street, New York; Philadelphia Rubber Works, Philadelphia, Pa.

The Illinois Alloy Company, 41 and 42 Portland Block, Chicago, have issued a circular showing the result of a comparative test of their best brand of bearing metal and that of four other makers by the Ohio State University on the 11th inst. The journal was kept well lubricated and the total pressure was 2000 pounds. With sperm oil the average friction shown by their metal was 0.0582, against 0.075, the lowest of the other four; the minimum friction was 0.034, against 0.0485, the lowest of the other four. With mineral oil the average friction was 0.0436, against 0.0686, the lowest of the other four; the minimum friction was 0.0305, against 0.0465, the lowest of the other four. With lard oil the average friction was 0.0517, against 0.0554, the next lowest; the minimum friction was 0.0375, against 0.0455, the next lowest.

A charter has been issued to the Pittsburgh Iron Company, of Pittsburgh, capital \$10,000. The directors are Charles Hood, Joseph Vogel, Sr., E. L. Clark and John Bunnette, of Pittsburgh, and Joseph Robbins, Westmoreland County.

The sheet and rod mills of the Tamarack-Osceola Copper Mfg. Company are being driven with orders, as there is a large amount of work to be turned out and shipped before the season of navigation closes; 25,000 pounds of bars were turned out last Monday. A 15-lamp dynamo is being placed in the mill, to be driven by the 12 x 12 blower engine. The new wire mill is covered in, and the foundation for the engine, which is to be a compound Wheelock, is being put in. Work on the smelting buildings is being pushed rapidly forward, one of the buildings being almost completed.

Kingman & Co., Peoria, Ill., announce under date October 4 that they were awarded the first premium for the largest and finest display of farming machinery at the St. Louis Fair, October 2, 1888, and allude to the extent of the exposition of agricultural machinery and products as giving value to the compliment bestowed upon them. They also state that they are busily at work rebuilding their Peoria warehouse, which was burned August 14, and state that they will add another story, giving them seven floors. They are also building the Peoria Cordage Company's factory, and expect both to be under a roof by December 1.

The Iron Age

New York, Thursday, October 25, 1888.

The Percentage Fiend.

In our recent articles dealing in a general way with the question of protection, we have sought not so much to follow the well-worn lines of argument on the subject as to point out features of it which have been largely overlooked on both sides. It is in that spirit that we now desire to call attention to the performances in this field of one of the pests of logic, the percentage fiend. Nothing is more fashionable among amateur statisticians than the expression of all results in percentages. It gives such an air of scientific generalization and irresistible conclusion, and so few people will take the trouble to analyze the process by which the imposing result is reached, that the temptation to adorn the flimsiest structures of statistical inference with this fine architectural cornice is well-nigh irresistible to the Buddensieks of sociology, politics and finance.

When the greenback dollar was worth but fifty cents in gold, the percentage fiend declared that the depreciation amounted to 200 per cent. And we notice something of the same quality in many of the percentage calculations now current on the tariff question. Apart from such crass arithmetical blunders, however, there are more serious and subtle errors attending the use of percentages in talking about the tariff. One of these has been often exposed, but continues to be asserted by one party and not infrequently permitted to pass without denial by the other. We refer to the current statement that the Mills bill reduces the average duty from about 49 per cent. to about 42, or only about 7 per cent., and is, therefore, nothing so very terrible after all. We have heard these figures slightly varied, but this seems to be the "average" statement. It is incorrect and misleading from every point of view. In estimating the average reduction it excludes all the articles put on the free list; or, to speak with the tongue of the fiend, it arrives at the average percentage by omitting all items of 100 per cent. Moreover, a reduction from 40 to 42 per cent. is a reduction of over 14 per cent. And, finally, the whole method of estimating the "average" duty in this way is utterly worthless as a measure of the amount of protection accorded by the tariff—so utterly worthless that the man who discusses the tariff in terms of percentage only goes far to demonstrate his entire ignorance of the alphabet of the subject.

The percentage of a single duty is not the measure of its value to the manufacturer, or even of its alleged burden upon the consumer. And the average percentage of duties throughout the whole list of dutiable goods means still less. There are two ways of calculating it, one of which

is as meaningless as the other. The duties themselves may be averaged, giving each item in the law an equal value, without reference to the quantities imported; or the total valuation of imports may be compared with the total Custom-House receipts. It is evident that by either method a thousand different tariffs might yield the same result, and that by the second method (which we presume to be that of the "average" percentage fiend of to-day) the same tariff will yield a different result every year. The final *non sequitur* is reached when, for the purpose of such a calculation, specific duties are transferred into percentages, so that as protection and progress cheapen goods year by year the "extortions" of the tariff are made to appear bigger and bigger. Thus American railroads were but slightly burdened when steel rails sold at \$165 per ton, and are crushed to earth with rails at \$30 or less!

There is another exercise in which the percentage fiend delights. "In such-and-such a year," he cries, "such-and-such a trade thought so-and-so-many per cent. a sufficient protection. We have given them that much in the Mills bill, and they pretend it will ruin them. What impudent and self-evident lying!" We do not expect to reclaim the fiend. In fact, we have called him a fiend to signify that he is beyond reclamation. But innocent people, puzzled if not tempted by his demoniac suggestions, may profit by the following reflections: Assuming that the American manufacturer of any article needs and ought to have any protection at all, and is not necessarily a thief and robber if he asks for it, what he needs is not so much a percentage as a certain definite sum to cover his extra costs. His protection consists of this sum, plus the freights of his foreign competitors. An ad valorem duty is not as good, either for the manufacturer or for the public, as a specific one. The duty which helps to protect him does not protect simply in the proportion of its percentage. The cheapening of his product by competition and scientific improvements does not necessarily reduce his need of protection in the same proportion. And the reduction of ocean freights may deprive him of so great a part of that protection as to render his request for a higher percentage of duty (or even for an absolutely higher specific duty) entirely reasonable. In other words, the fiend's proposition is not self-evident at all.

The subject of the reduction of cost in international transportation is one that has not been sufficiently considered by tariff disputants. And it is part of a larger subject—namely, the total revolution in the business methods of the civilized world during the last two decades, in accordance with which political economy has got to be reconstructed also. It will still be open, to any one who chooses to advocate entire free trade; but it must not be supposed that even free trade will operate as it would have done 20 years ago, when the protective barriers of nature—distance and the sea—still exerted a formidable influence. This tariff of nature has been almost removed by the progress of science, and, in the face of this reduction of duty, prating about percentages is both superficial and superfluous.

Finally, if a certain duty, however expressed, is necessary to maintain the existence of a given industry, there is no sense in the proposition that its reduction by a given percentage, whether 7 or 14 or any other amount per cent., is moderate and liberal treatment and not "free trade." Less than enough is practically nothing. We do not now propose to discuss the question whether the reduction of duty proposed in the Mills bill would, in fact, destroy any American industry. What we desire to emphasize is the fact that the proposal is made in ignorance of its effect; that no adequate inquiry into the matter preceded the framing of the bill, and that its reported authors and avowed advocates before the public fully betray and confess this fact when they adopt as their only argument the lingo of the percentage fiend.

Hamburg in the German Customs Union.

The merchants of the hitherto free Hanseatic cities, Hamburg and Bremen, are the most enterprising, and, financially, most powerful, in Germany. They are, at the same time, the largest shipowners; their trade extends to the remotest corners of the habitable globe, and, with the United States—New York in particular—they have at all times transacted an enormous amount of business. Hardly a day passes but one of their large steamers enters or leaves our harbor. A radical change in their commercial and industrial condition is, consequently, a matter of no small interest to ourselves. They were large free ports, and prided themselves upon being the last remnants of the famous Hanse League of commercial cities, founded in the year 1239.

Steam, the telegraph, and, finally, the restoration of the German Empire, have, however, wrought such changes that both ports enter the Customs Union without regret—nay, with a confident hope of bettering themselves. The fact is that large free ports are at a discount, since there is no longer any necessity for the accumulation in bond of large amounts of staple products at leading ports, steam, the telegraph and the Suez Canal facilitating the rapid procurement of such goods, and, furthermore, enabling large inland cities to do an extensive direct trade with Transatlantic countries, the goods passing through the ports merely in transit. Trieste was the first free port declaring its readiness to abandon what was till then deemed an enviable privilege. At the time of the restoration of the German empire, in 1871, two of the four free cities in Germany had already lost their freedom, one forcibly—Frankfort-on-the-Main in 1866—and Lubeck voluntarily soon after. Upon the creation of the new empire Hamburg had stipulated that her old rights of a free port should be maintained, and a guarantee to that effect had been given in Article 34 of the constitution of the empire. But it had been found that from the time Frankfort became an integral part of Prussia its prosperity increased more than ever. This the Hamburg people knew, and gradually a majority of them decided to enter the Customs Union, especially since it was feared that if they hesitated all the German commerce would pass via Altona and

Gluckstadt. In 1881 the city, therefore, petitioned for admission into the Customs Union, and a convention was drawn up fixing the conditions of such admission. The right of Hamburg as a free port is not entirely surrendered by this convention, but the free entry is limited to a quarter on the left bank of the Elbe, in which quarter, however, nobody is permitted to reside, nor are there to be any bridges connecting it with other parts of the town. In order to simplify the customs regulations a canal had to be dug along the left side of the river, toward the expenses of which the Federal government contributed 40,000,000 marks. Besides, Hamburg's demand was granted that ships should be permitted as heretofore to pass from the sea into the free port without customs inspection, and that the supervision between the free-port part of the town and the Customs-Union territory should be intrusted to Hamburg officials.

Hamburg will gain more advantage from the annually growing seaport trade of Germany than it had from its own manufacturers and maritime trade in foreign products. Besides, even this trade will increase and not diminish, and with the powerful assistance of the German Empire it will have nothing to fear from other ports, like Antwerp, for instance, which otherwise might have become an extremely dangerous competitor. The measure of incorporation was passed by the German Parliament in 1882, and became operative on the 17th inst.

Old Hamburg has ceased to exist, and a new state of things has been established and inaugurated by the abolishment of the separate excise duties of the town, which have a very interesting history of their own, and which still found many defenders during the last few years; but the citizens of Hamburg, when they once had decided to enter the Customs Union, wanted to abolish even the last remnants of their mediæval commercial legislation and make a clean sweep. The little houses on the turnstiles have been demolished, and magnificent edifices of the Federal Customs Administration have been erected where the free port district borders on the protective territory. On December 1, 1885, the population at Hamburg was 518,620; in 1886, its import of merchandise amounted to 2,080,700,000 marks, and of specie and bullion to 49,600,000; the merchandise received from the United States, direct, was 111,600,000 marks. Bremen will follow suit and be merged as soon as all the new custom-houses there shall have been finished, together with the new harbor works.

Cheap Passenger Tickets.

Some of our progressive merchants in different lines of trade have been discussing among themselves the feasibility of certain improvements in transportation, and during the early winter something may be done publicly toward asking the attention of railway managers. One of these things is an extension of the excursion or round-trip plan in tickets. It is well known that the old traditions of the Trunk lines were all against any reduction from the one rate of fare. The argument was that the buying of a round-trip half-fare ticket meant merely so much loss, since the regular full fare would other-

wise be paid, but this is clearly erroneous. As a matter of fact the cheap traveler and the first-class passenger can scarcely be classed together, and are not really competitive. One man wants luxurious vestibuled cars with all the modern appliances of speed, dining cars and the like, and is willing to pay for them. Another country merchant, obliged to look closely after his dollars, is tempted into a journey to his headquarters by a reduction of fare, even if limited to slower trains. The astute railroad manager accordingly arranges his fares and time-tables to secure both kinds of travelers. This is the highest wisdom, for, granted that the trains must run, any plan which will fill them full instead of half-full will add to the earnings and little or nothing to the expense. It is important that the cheap tickets should not be used by the well-to-do first-class passengers, and many are the devices to secure this end. The English plan is by different coaches on each train at different rates of fare, but this is cumbersome, since it requires the hauling of many more cars than is necessary to accommodate the people. To confine cheaper travel to special trains is tried in the United States by means of "limited" trains, or, in the case of workmen's trains, at special hours.

In freight matters the American railways lead the world in cheapness, and this has been accompanied by such an increase in tonnage that net revenue is not diminished. This has been brought about in a measure by the principle of fitting the rate to the necessities of the shipment, so that traffic which could only be moved at lowest rates was carried, and with it other shipments at double the charges, each according to its commercial ability to pay the carrier. If it were possible to apply this same principle thoroughly to passenger travel we would solve the problem. If we could judge whether a journey were worth \$5, or \$20, or \$1, to a passenger, and could sell him a ticket accordingly, we could double the present number of trains at increased revenue for the railroads, and at the same time give all merchants a chance to come into town on frequent trips in search of purchases or novelties. It is in human nature to settle into ruts, and we all need the stimulus of other minds and of other sights than our usual ones to make us put forth our best exertions. A general storekeeper who rarely leaves his native village soon loses his ambition. So it is that the city manufacturer or jobber who wishes to see the reward of his thought and enterprise in larger sales must at the outset find customers who appreciate this effort, and this in turn demands a certain amount of culture which is not so often found in retailers who never leave home. Hence, it follows that the manufacturer or jobber has a direct interest in giving his support to any movement among his fellow tradesmen or among the railroad men to bring to his city such retail merchants as do not now travel, but who might do so under a reduced rate of fare.

It is but fair to concede to the railroads such restrictions upon cheap tickets as will generally restrain their sale to the class for which they are designed, and yet there is no doubt that less progress has been made in this direction than in any other department of railroading. We need a more thorough study of the passenger problem,

with more liberal views as to the effect and the necessity of half-fare round-trip tickets. If this could be secured all would be gainers—the railroads, in trains well filled; the city merchants, in more frequent visits from country customers, and their consequent more rapid sales of novelties and improved articles; the neighboring tradesmen, in opportunities for keeping a better run of things and for personal inspection of city stocks. Intercourse is the great means whereby we all advance in civilization equally, and cheap tickets for those who cannot buy dearer ones would greatly promote it. The merchants can suggest, but the practical steps must be taken by the railroads. If, as hinted, some public requests be made by merchants in different cities during the winter, asking that the matter be given closer attention by our railroad superintendents and passenger managers, then we may hope for a practical advance in this direction.

Settling a Strike.

An important chapter in strike literature has just been contributed in Chicago. The development of the trouble leading to the strike and the subsequent attitude of the contending parties in interest were of an unhappily common character; but the way in which the matter was finally settled was altogether unique and worthy of being taken into consideration in other localities. A demand for a rearrangement of working hours and an increase in wages had been made by the employees of an important street railway company, which was conceded by the managers as to the first point, but refused as to the second, whereupon all hands struck. For the purpose of embarrassing the management, a strike was also precipitated on another extensive street railway system in which they were interested, although the employees of that system had no grievance of their own. A third line, having no connection whatever with the first two, was also tied up, merely because it ran through part of their territory. Altogether a good two-thirds of the street railway service of Chicago was involved, to the great discomfort, inconvenience and even pecuniary loss of a large part of the city's population. This condition of affairs lasted for a week, an attempt being made in the meantime by the railway managers to secure new men to run their cars, which was opposed in every way by the old force of hands and their sympathizers, requiring the constant efforts of the entire police force of the city to prevent rioting and consequent damage to property, as well as loss of life.

During the continuance of the strike unceasing efforts were made by the city authorities and prominent citizens to bring the contending parties together and effect a basis of settlement, but their well-meant attempts at mediation were unsuccessful until the citizens generally held indignation meetings protesting against the stubborn attitude of the belligerents and insisting upon the adoption of a compromise. The daily press also took the same position, and a powerful expression of public opinion was thus evoked which had its influence. Committees were appointed by the striking men to meet the railway managers and Mayor Roche in consultation, and those who were striking in sym-

pathy were ordered back to their posts again to await the result of this supreme effort to settle the trouble. Professional labor agitators, who had made themselves conspicuous in directing the councils of the strikers, but were not railway employees in any capacity, were excluded from the deliberations.

Then came the critical point, when the most careful management was needed to bring the hostile parties upon a common ground of mutual concession and effective agreement. The conference was long and evoked much bitterness, but Mayor Roche steadily reminded both sides that, as the representative of the people, he was there to see the dispute finally settled, and that a compromise should be arranged. A beginning was made, but details were hotly disputed, new objections and difficulties arising as soon as old ones were disposed of, any one of which would probably have been a fatal bar to further progress toward a settlement if the chief magistrate of the city had not persistently appealed to the parties that they should not permit trivial matters to interpose and prevent an agreement. At length all questions at issue were adjusted and the strike was pronounced at an end. It would hardly be supposed that the result of negotiations carried on under such circumstances would be very satisfactory to either set of disputants. Both gave way further than they would have done without the pressure personally applied through the Mayor, but which they felt came from the citizens generally. The sores left may take some time to heal, and an occasional outcropping of bitterness may be manifested, but the condition of affairs is much better with a general resumption of business than would have been the case if the fight had continued several days longer and involved widespread interest. The loss in income to corporations, in earnings to workmen, in sales to business men, might have reached enormous amounts, to say nothing of the inconvenience entailed on all classes of citizens and the inevitable accompaniment of injury to persons and damage to property.

This has been averted by the decisive action of Mayor Roche. The position he took as a compulsory arbitrator is worthy of imitation under similar circumstances in these days of frequent strikes and labor troubles. The warrant for such action does not necessarily rest in statute law, but comes from a higher authority—the welfare of the community. The questions at issue between employers and employed may seem to them to be of immense importance, but the interests of the people at large are paramount. Mayor Roche did well in making them an active third party in the settlement of the Chicago controversy.

OBITUARY.

FRANK M. REYNOLDS.

Frank M. Reynolds, superintendent of the United Coal and Coke Company, died recently at his residence in Connellsville, Pa., after a brief but severe illness, in the thirty-sixth year of his age. Mr. Reynolds has been identified in various responsible capacities with the interests of the Connellsville coke region for about 15 years, and was highly esteemed by all who were brought into contact with him.

Triple Power Hydraulic Shear Legs.

A short time ago Mr. G. Richou gave, in *Le Génie Civil*, an account of the triple power hydraulic shear legs erected at Marseilles, France. From an abstract of his article, just published in the "Excerpt Minutes of the Proceedings of the British Institution of Civil Engineers," we take the following:

The shear legs constructed for the port of Marseilles, by the Fives-Lille Company, and placed on the quay near the graving-docks, had to be designed to lift a load from a vessel alongside the quay and deposit it on a wagon or truck near the edge of the quay for its head to be able to advance 29½ feet beyond the edge of the quay, and to recede 16½ feet behind it, and its height such that the load could be lifted over 23 feet above the quay level. It had to be made to work, at pleasure, at powers of 25, 75 and 120 tons, with a proportionate expenditure of water, and to be provided with a capstan for conveying the loaded truck directly beneath it and for removing them.

To illustrate the novel arrangements introduced in these shear legs, the author commences with references to some of the shear legs previously erected. The old type consisted of two shear legs fixed apart, one behind the other, at the bottom, but connected at the top, hanging over the quay to the requisite extent, and maintained in a fixed position by ties anchored in the masonry. The lifting was effected by pulleys fastened to the tops of the shear legs, and moved by hand winches or capstans, whilst other pulleys were required to draw the load on to the quay. These shear legs required a number of men, and their greatest power was 40 tons. The increased power required for handling the large guns of ironclads and marine boilers has led to the adoption of shear legs, similarly fixed, but worked by steam or hydraulic power, of which, among those made within the last 20 years, may be cited the shear legs erected at Toulon, Antwerp, Spezia and Elswick. The machine at Toulon, constructed in 1867, consists of a couple of fixed shear legs, connected at the top by a strong girder, on which the trolley runs which shifts the load. One steam winch lifts the load, and another shifts its position. The motive force is an engine of 30 horse-power, and the maximum power is 50 tons. The shears erected at Antwerp in 1878 has three legs, connected at the top by a steel axle; a hydraulic machine with three cylinders works alternately a winch carrying a cable for lifting and two endless screws, which move the bottom of the hinder leg, and, causing the two other legs to turn on two pivots fastened on the quay wall, shift the load horizontally. The working is simple, but the toothed gearing and endless screws produce considerable friction, and are not suited for accelerated working, which is sometimes necessary. The three-legged oscillating shears at the Elswick gun factory transports the load like the Antwerp shears, but the lifting is effected by the aid of a hydraulic cylinder suspended from the shears. The lifting is similarly effected by the shears at the Spezia arsenal, also erected by Sir W. G. Armstrong & Co., but the horizontal movement is produced by the rotation of the shears. Both these last-named shears can lift 160 tons.

The new shears at Marseilles are three-legged and oscillating, like those of Antwerp and Elswick, and with direct action, both for the lifting and the horizontal motion. The piston of a hydraulic press, acting upon the bottom of the hinder leg, effects the oscillating movement; and another hydraulic press, suspended from the top of the shears, accomplishes the lift-

ing. An automatic multiplying apparatus causes the water pressure to be increased for lifting loads of between 75 and 120 tons, and to be reduced for loads of between 75 and 25 tons. An accumulator holds in readiness the greater portion of the water, under pressure, required for one operation. An apparatus, furnished with cables, erected on the back of the hinder leg of the shears, serves for accessory operations and for lifting loads not exceeding 8 tons. Lastly, a suspended platform, on which the conductor stands, enables supervision to be exercised close at hand over all the operations. The hydraulic cylinder for lifting, instead of being hung from the top, as at Elswick and Spezia, which is liable to cause leakages and thus impair the power of the machine, is suspended from its forged steel bottom by two steel rods, fastened to the top of the shears by a Cardan joint, relieving the cylinder from the strain of the load, and affording it the required mobility. The diameter of the cylinder is 1½ feet, having been calculated for a mean power of 75 tons, with a water-pressure of 710 pounds per square inch. The automatic multiplier is used for powers of 25 and 120 tons, consisting of two cylinders, placed end to end and fastened together by rods, in which two pistons of different diameters work. Two of these machines, placed side by side and coupled, insure a continuous motion of the load when lifted. The water-pressure, which continues uniform, is directed against the larger or smaller piston, according as the water-pressure in the lifting cylinder is to be increased or diminished; for the larger piston, acting on the smaller piston, increases the pressure of the water delivered into the lifting cylinder in proportion to their diameters—namely, up to from 1280 to 1420 pounds on the square inch; while, when the smaller piston acts on the larger piston, the pressure is proportionately reduced. The diameter of the large piston is 1.1 foot; of the smaller piston, 10 inches, and of the connecting rod, 9½ inches, and the length of stroke is 3.28 feet. The maximum height of lift, of 46 feet, can be accomplished, in case of need, in 28 seconds. The shear legs were tested, in August, 1887, with a load of 140 tons, and worked perfectly. The efficiency of this machine, with direct action, is much greater than where the power is transmitted by cables, and for loads of 75 to 80 tons, not requiring the intervention of the multiplier, is at least 90 per cent., instead of an efficiency of only 25 per cent. for the type of shears like those at Antwerp.

Corporations were recently organized in Illinois as follows: The Fox Solid Pressed Steel Company, at Chicago; capital, \$500,000; incorporators, Charles S. Holt, Colvin C. H. Fyffe, Arthur D. Wheeler. Chicago Carriage Lamp Company, at Chicago; capital, \$15,000; incorporators, John H. Kaiser, Jr., Charles H. Engel and Frau L. Brooke. The Universal Heating Company, at Chicago; capital, \$50,000; incorporators, Lewis K. Curlett, Henry Boyce, W. Knox Haynes. Sim Foundry Company, at Chicago; capital, \$12,000; incorporators, Justin R. Graves, John C. Armstrong, Martin M. Gridley. National Implement Company, at Aurora; capital, \$200,000; incorporators, W. H. Craddock, Frank D. Ray and William D. Goodnow. A certificate was filed changing the name of the Larm Mfg. Company, of Chicago, to the Harmless Spur Wire Company.

At New Orleans the freight rate on cotton to Liverpool has advanced 10 over 1 cent a pound, the highest point reached in many years. Ocean freights are high all over the world.

A TALK ON STEEL.

One of the features of the Scranton meeting of the American Society of Mechanical Engineers was the discussion of the query, "What experiences and phenomena can you describe as to the conduct of steels under the conditions in which you were using them?" At a previous meeting of the society so much interest had been manifested on the subject that it had been deemed desirable to give a more than ordinarily long allowance of time to this topic, and written and oral contributions had, therefore, been freely invited.

As a result Mr. W. W. Dingee wrote to the effect that the J. I. Case Threshing Machine Company use large amounts of machinery steel in the manufacture of threshing-cylinder teeth. This steel cannot be hardened with any certainty by any of the usual methods. The chief trouble with it comes from its uneven texture. It is not very uncommon to find a bar that may be broken like cast steel, when within a short distance of the break it can be bent cold.

Mr. Wm. Kent had sent samples of trusses for torsion balances, with spring steel wires stretched upon them, that had been under test for some months past in the factory of the Springer Torsion Balance Company. The longest of the three wires on the double truss had been twisted through an angle of 45° —that is, $22\frac{1}{2}^\circ$ each side of its normal position 7,100,000 times. The two shorter wires on the single trusses had been twisted through an angle of 16° 2,200,000 times. These wires were stretched originally to the notes C sharp and D above the staff respectively. After they had been twisted 1,000,000 times each the tone was tried again, and one of the wires appeared to have a tone half a semitone higher, and the other was about half a semitone lower than when the test was begun, possibly a mistake in the original tuning. After they had been twisted 2,000,000 times each the tone was found to be same as it was after 1,000,000 twists. As regards steel of low tensile strength Mr. Kent said: "The lowest tensile strength I have ever found in steel was 42,000 pounds per square inch. It was American open-hearth steel made for horseshoe nails. The composition was about, carbon, 0.10; phosphorus, 0.012; manganese, 0.20; silicon, 0.02. It was necessary to keep the phosphorus extremely low to secure the low tensile strength and great ductility desired." Concerning high tensile strength of watchspring steel Mr. Kent said: "Some three years ago I procured 13 samples of watchsprings and tested them for tensile strength in a crude apparatus in which a strong spring balance was used to indicate the strain. The springs included a Jurgensen main spring, an English, a Waltham, a Waterbury and several other springs of various sizes and different tempers. The tensile strength of the whole lot of 13 varied between the limits of 300,000 and 375,000 pounds per square inch, a much less variation than might be expected considering the variety of sizes, tempers and sources from which they were obtained."

Mr. George R. Stetson had sent a broken drill. The singular regularity of the fracture was peculiar. The break was not at a shoulder, but about 1 inch from it. This piece of steel broke during the night after having been in the hands of a workman for several hours. The shank was forged from larger stock, and cooled by dipping in water. There was heat enough to harden it somewhat. The cooling no doubt caused the fracture, but why it should have taken several hours before the break occurred is difficult to understand. The steel stood rough handling, but broke during the night while lying on a machine,

part being found on the floor. Mr. Stetson did not think it a good practice to hurry the cooling of steel in this way, although the water annealing of steel is usually satisfactory if carefully done. This breaking after hardening is not unusual, sometimes not developing for several days. One of the members spoke of such an incident happening after months. There may be foundation for the belief that clock and watch springs break during a thunder shower more frequently than at other times, and that a razor is improved in cutting qualities after lying unused for some time. He forwarded part of a large tap broken in hardening. The imperfection of the steel was apparent. Such a fracture is common with large tools; whether large tools that do not break have this imperfection or not it is impossible to know. The majority of sizes, 4 inches and above, that do not break show irregularity in grain. The question naturally arises, Why should so slight a cause produce this result? The most common breakage of taps in hardening is at about 1 diameter from the entering end of the tap. By screwing an iron washer over this end of the tool to keep the water from it this breakage, it was thought, could be lessened. This could be done by tapping out the center for a small machine screw, and holding the washer against the tool by this screw. Samples of drills cracked in hardening were shown. Much the larger loss from breakage on drills, larger than $\frac{1}{4}$ inch, show this peculiar fracture. It is not confined to any part of the twist, though the samples are toward the shank or solid part of the drill. There was a peculiar uniformity in the fracture, and in all the hundreds which had been noticed the fracture never is reversed or pointing toward the shank.

Mr. E. Fawcett said: "Some time since we had occasion to make some large taps and dies for bridge bolts, and being in a hurry, the forger in annealing left them in a bed of charred (bituminous) coal on the forge over night to give them a good "soaking," as he called it. On working the steel we found it to have a very coarse crystalline structure and to be brittle. Needing them immediately, we finished them up, tempered and put them to work. One of them broke after threading some hundreds of nuts, but did not show as large a crystalline structure as before tempering; the others have been in use ever since. The steel was ordered for the special purpose from a well-known manufacturer in Pittsburgh, and had every appearance of being first class."

Mr. Levi K. Fuller said: In 1885 I had occasion to make a series of dies and punches for the Estey Organ Company, to be used in punching sheet brass for reeds, both block and tongue, for use in their organs. The steel was No. 4, Sanderson Brothers Steel Company, Syracuse, N. Y. The bar was cut into various sizes in a planer, heated in a charcoal fire and annealed in wood ashes. The specimens were then planed to various sizes and thicknesses, ranging from $1\frac{1}{8} \times \frac{1}{4} \times 3$ to $\frac{1}{2} \times 3 \times 3$. These were heated to a bright red, in accordance with the instructions printed upon the label on the bar of steel, and hardened in water and ground without the temper being drawn in the least. They were then subjected to grinding in an emery grinder to the proper sizes; they were ground on a frame but not confined, remaining loose so as to allow the steel to move, if there was any tendency in that direction. As the skin was removed upon one side the surface was slightly concaved, and they had to be turned over and ground upon opposite sides five times before they ceased changing their form. The various blocks were planed 0.010 thicker than the finished size to allow for grinding. They were ground 0.0001 inch alternately on each side, receiving a total of five grindings upon

each side, reducing the total thickness 0.10 inch as above stated. After they had been ground a few hours, they began to crack, and nearly every one was ruined by reason of this tendency. In some cases they would break into a dozen pieces. I had communicated with Sanderson Brothers Steel Company, and they attributed the fact to overheating, but the description "a bright red" had been strictly followed, and had been none too high for similar steel for a like use. Samples of this were sent to Sanderson Brothers and tempered by them, and the temper slightly drawn, but it was not sufficiently hard to do the work. We then resorted to steel No. 5, same make, which had precisely the same treatment as first described, and which has resulted in no case in breakage. The work performed by the sample returned to us by the Sandersons was the punching of 5000 reeds without regrinding, while the No. 5 will punch 20,000, and with some thicknesses even more. The dies were perfectly square and were set with a piece of tissue paper 0.0005 in thickness between them, cutting a perfectly smooth edge.

Mr. Chas. L. Houston wrote: "In the discussion at the Nashville meeting as to the significance of the peculiar curved lines which appear in the disturbance of the surface scale of steel boiler plates, caused by the strains of shearing, some of the members claimed that it was only a scale disturbance, and it did not indicate any injury to the metal. I have reason to believe, however, that it is an indication of injury to the body of the metal, and send herewith a piece of plate which had been so affected and afterward was stretched and broken in a testing machine. The lines show very plainly that the metal had been strained beyond its elastic limit, not only upon the surface but to some depth (as shown on the edges of test piece), so that when afterward it was stretched it did not so readily yield at these points, leaving elevations of slight extent upon the surface. The lines upon this sample are not so much the peculiar curved ones, the result of shearing, as they are those resulting from the curling of the narrow scrap at the shears and the subsequent straightening to prepare for testing. I have observed, as also have many other workers of steel, that metal of some degree of ductility when subjected to strains will sometimes crack like glass, showing no evidence of ductility at the point of fracture. I noticed some five years ago one striking case of a $\frac{1}{4}$ plate of American made basic steel, which was sent to a locomotive works to try its flanging qualities. It was flanged into a locomotive throat sheet, the edges being first turned down and then the concave end worked out. The next morning a crack appeared at the opposite end which had not been heated at all, and had had the roughness of shearing removed by planing. This crack continued to extend for a week or ten days, until it reached the whole way across to the part that had been heated. This, of course, was due to the contracting strain at the flanged end, and the sides of the crack showed little or no evidences of having reduced or stretched at the fracture. I had a test piece taken from one side of the crack and prepared so that when pulled it had the crystalline face of the crack for one edge of the test piece. The test, taken nearly across the grain of rolling, showed a tensile strength of 68,580 pounds per square inch and a reduction of area of 42 per cent., with a fibrous fracture. I send one end of this piece, which, however, is almost too old and rusty to show its character. I also send some numbers of the *Journal* of the Franklin Institute, showing the results of some curious tests made by my father. One series, 1878, shows that steel and iron both when raised to

about 600° heat F. lose in ductility and gain in tensile strength; this is also corroborated by bending and tensile tests made in Europe and translated for the *Journal* of the Franklin Institute in 1885. Another set of my father's tests shows the effect of straining iron up to nearly its elastic limit and continuing the strain for 24 hours or more, the result being in some cases raising the elastic limit almost to the ultimate strength of the material."

Mr. Chas. T. Main remarked: During the year of 1883, when arranging the driving system of the Lower Pacific Mills, at Lawrence, Mass., it was thought that steel shafts for head lengths would be stronger and more desirable than iron. Accordingly quite a large number of these of 4 and 5 inches diameter were put in. The calculated sizes were amply sufficient to carry their respective loads, and the shafts were well supported by hangers near the pulleys and were firmly held. In less than a year two 5-inch shafts had broken in one place, and one in another place, and four 4-inch shafts had broken. These were replaced with forged iron shafts, which were subjected to the same conditions of load, speed, &c., the bearings remaining the same as before. The 5-inch shafts are still running under the same conditions. The 4-inch shafts are still running, although the conditions have more recently been changed. The other steel head lengths which did not break were all changed for iron with one exception, which still remains as it was.

Mr. H. D. Hibbard, of the Linden Steel Company, of Pittsburgh, called attention to the importance of giving as far as possible the history of the steel under consideration. "To those not engaged in its manufacture," he remarked, "steel is steel, but not necessarily so to those engaged in the business. Unless the history of its manufacture is known much of the other information about it is useless. Even with the chemical analysis known, which is essential, the great variations in physical properties due to different methods of manufacture and subsequent treatment may account for any anomalies, and unless these are known the mysterious element of the symposium will not be kept at a minimum. As no two plants are alike, no two methods alike, and no two men alike, the most complete description of the steel would indicate the name of the firm and man who made the steel. Then would follow the subsequent manipulation to put the steel in shape for use. Even then the mishaps it has met with from bad workmanship will never be known."

Mr. Oberlin Smith presented the case of a set of steel dies 4 inches square and 1 inch thick, in hardening which the jaws were found to crack so frequently that a large loss resulted. The explanation, of course, was that the relatively small jaws cooled so quickly, as compared with the large body of the die, that violent strains were set up. As a remedy, an arrangement was adopted by which the die, while undergoing hardening, was slowly revolved in a vertical plane and gradually lowered into the cooling liquid. The cooling thus proceeded from the outside, the outside corners first being acted upon. These occasionally cracked off, but only in a very small number of cases, and the method proved highly satisfactory. In hardening taps, Mr. Smith had found the outside portion to crack off in many instances. To obviate this, he recommended drilling a hole in the middle of one end, thus allowing the water to act on the inside and outside at the same time, in this way equalizing the strains resulting from cooling. Mr. Smith further attributed irregular strains in a great measure to lack of homogeneity in rolling or casting. Burning of the metal, he thought, resulted from the action of the air-blast in a forge, and, as a remedy, suggested a deep fire

and exposure of the metal to radiated heat only.

Mr. J. E. Denton referred to the breaking of iron shafts on six Hoboken ferry-boats within one winter. One of the shafts had been in service less than a year and the others for periods of from three to five years. The breakage, it was thought, resulted from the adoption of iron paddles in place of wooden ones, but subsequent experiments showed them to be fully capable of withstanding the increased strain. Mr. Denton referred also to the breakage of Krupp-steel shafts on the Allegheny River, the steel in all cases having been found to be of good quality. As to the influence of the nature of the strain in producing fracture, attention was drawn to experiments with watch springs, which showed that if the strain was only small enough it could be applied an infinite number of times without damage.

Prof. John E. Sweet, in referring to hardened steel for standard gauges, remarked that length pieces were found to constantly change after hardening. With cylindrical pieces also, after having been accurately ground, it was found that after standing on end a few hours they became enlarged in diameter in a north and south direction. In order to prevent a change in length of gauges Mr. Geo. M. Bond suggested leaving the gauges unfinished for six or eight months after hardening. The strains due to hardening, he remarked, were greatest at the end, and all gauges, before being sent out for use, should be heated a second time to a temperature higher than any they may be liable to encounter in practical use. Tests have shown such second heating to shorten the pieces. In the matter of equalizing the strains in taps from cooling Mr. Bond recommended drilling a hole clear through each tap, this having worked well with 6, 9 and 10 inch bridge taps. Mr. Bond further cited the case of a gauge $2\frac{1}{4}$ inches in diameter, which, four days after having been hardened and finished, cracked through the middle, measurement, moreover, showing the end diameters to have become enlarged.

Capt. Robert W. Hunt spoke in an interesting manner of the effect of manganese on steel for gun barrels. During the Turko-Russian war the Winchester and the Smith & Wesson companies, it appears, had in hand large contracts for guns. Both firms for a time used imported steel. The Winchester Company wanted for their purposes soft octagon steel which would give a short chip in boring. In supplying such steel in this country it was found necessary to keep the manganese down to about 0.4 per cent., an increase over this causing a long chip and a rougher bored surface. As to the quality of steel, Captain Hunt held that primarily it was all good, but the men who handled it were careless and largely responsible for the erratic behavior of the metal. The quality of steel rails, he thought, was actually deteriorating, but as to the good old rails of which we sometimes hear—they had been shown to be chemically mean, the phosphorus often running from 0.07 to 0.15 per cent. The reason of their good behavior in use was purely physical, the steel being worked at a lower temperature.

Mr. F. H. Richards, in speaking of taps and dies, remarked among other things that in some New England shops forging small steel tools was considered a failure and orders had been given that such tools should be cut from the solid. Mr. Oberlin Smith remarked that hardening sometimes caused steel rings to swell and sometimes to contract. Mr. Barr cited the case of 50 taps in which, after hardening and finishing, the threaded portions were alike in less than 6 pieces. Mr. Jerome Wheelock spoke of tempering valve stems $2\frac{1}{4}$ inches in diameter and 9 feet long. These are kept below scaling heat and

dropped into the water vertically. This method was almost uniformly successful. Prof. F. R. Hutton referred to some of the steel castings which had been turned out for the new war vessels built at Cramp's. In these heavy castings sharp angles had been carefully avoided. Mr. W. E. Crane, in closing the discussion, spoke of the shrinking by rehardening of the dies used in drawing brass tubes.

The Carnegie Concerns.

In our issue of last week we made mention of the fact that some important changes in the firm of Carnegie Bros. & Co., Limited, and Carnegie, Phipps & Co., Limited, at Pittsburgh, had taken place. Since that time some additional facts in regard to the changes have been brought out. The reason for the retirement of Henry Phipps, Jr., is his serious ill-health which threatened to become more serious if he continued in active service. The retirement of John Walker, who held the position of Chairman of Carnegie, Phipps & Co., Limited, was caused by difference of opinion between himself and Andrew Carnegie dating back to the big coke strike and subsequent events. Both gentlemen, however, severed their business relations with the understanding that the friendly personal relations would continue without interruption. On Thursday, the 18th inst., another change in the firm of Carnegie, Phipps & Co., Limited, occurred, E. A. Macrum who has held the position of treasurer of that firm for a number of years resigned and was succeeded by Lawrence P. Phipps, who is a nephew of Henry Phipps, Jr. On account of the many false rumors set afloat by the changes made in the firm the following statement was prepared and given out by Andrew Carnegie on the day after the changes were made.

At the request of Mr. Henry Phipps, Jr., Mr. D. A. Stewart was yesterday unanimously elected chairman of Carnegie Bros. & Co., Limited. Mr. Stewart, as is well known, has been one of the leading officers of the firm since its inception. He has for many years occupied the position of vice-chairman and attended to the duties of chairman during Mr. Phipps's absence. Mr. Phipps concluded his 28th year in the iron business this month, and felt that he should now be relieved from routine duties. His partners felt that he had deserved from them anything he asked, and gladly acquiesced. He is hereafter to occupy a similar position to that always occupied by Mr. Carnegie, that of consulting partner without salary. As heretofore, he will have full charge of all the finances of the various concerns. He retains his position in the firm as the principal partner next to Mr. Carnegie. Mr. John G. A. Leishman was elected vice-chairman. These changes required some corresponding changes in the firm of Carnegie, Phipps & Co., Limited, Mr. John Walker having sold his interest to the younger members of the firm. Mr. Wm. L. Abbott was elected chairman of Carnegie, Phipps & Co., Limited; Mr. H. M. Curry was elected vice-chairman and Mr. W. F. Palmer was elected secretary. Mr. Abbott entered the service of the firm 17 years ago, when quite a lad, at a small salary, and has risen step by step to his present position, having developed as he progressed. He was heartily congratulated by every one of his associates upon his deserved promotion, and enters upon the chief command with their cordial good wishes. Mr. Curry has been 16 years in the firm's service, having begun like Mr. Abbott as a young man at a small salary. All his partners rejoice over his fully earned promotion. Mr. Palmer, who has been promoted, has won his spurs by many years of distinguished service, and has been admitted to the firm as partner as his just reward. All other officials remain as before. In making these necessary changes the firm have adhered strictly to their well-known policy of promoting those of their own young men who have proved their ability and zeal during long years of service.

Carnegie, Phipps & Co., Limited, control the Homestead Steel Works at Homestead, Pa., the Lucy furnaces at Pittsburgh, and the Seventy-ninth Street Iron Works, or Lower Union Mills, also in that city. Carnegie Brothers & Co., Limited,

control the Edgar Thomson Steel Works at Braddock and the seven blast furnaces at that place, and also the Union Iron Mills on Thirty-third street, Pittsburgh. It is reliably stated that further changes are contemplated in both firms and will be made at an early day.

Providence Notes.

In a locked room in a shop in Pawtucket stands a machine, the invention of a Rhode Island gentleman, whose reputation as a civil and mechanical engineer is not confined to this country alone. It is a machine for making horseshoe nails, and represents seven years of experiment and study by Mr. John A. Coleman and the expenditure of tens of thousands of dollars. It is fully protected by patents, and, in the opinion of competent judges, men engaged in just this line of business, is destined to work a revolution in that industry. Across the room stands a larger machine designed for the same purpose, an admirable piece of work, but abandoned in the matter of some of its details now for the simpler form of the completed mechanism. A belt run through the partition brings the power, and, although the machine is not as yet run for commercial profit, several barrels of the finished product turned out during the perfecting of the mechanism are stowed in one corner of the room. The object sought was to make a nail which would be tougher than those in general use, which would not split and which would not crack the hoof—in short, a better nail in every way than any now in use. Mr. Coleman makes his nails by cold drawing from blanks considerably shorter than the finished article. The machine which takes advantage of simple natural laws is strictly automatic, the only attention required being that a supply of blanks shall be furnished, and these may be delivered in a tangle just as they are dumped out of a keg, and that the machine shall be kept well oiled. The essential parts are few in number and positive in action—in fact, the whole machine is wonderfully simple when the work it does is considered. The finished nails have as fine a polish as if rattled, and a long, even taper to a point as keen as a needle's. A new nail just from the machine dropped from the height of a person's waist will stick upright in the floor at one's feet. These nails have been thoroughly and satisfactorily tested in competition with standard makes of horseshoe nails. Although the machine is larger than its commercial issue will be, as it represents the evolution due to years of thought and development, it presents an interesting study in the manifest employment of the most direct means to effect a desired result, and is mechanically very satisfying. The machine will occupy but little floor space, and its design combines grace with ample strength. It is attracting much attention from men in the horse-nail and allied industries, and within a few days the managers of a company of ironworkers, employing upward of 5000 hands, spent nearly half a day in inspecting the machine with a view to negotiating.

The New York, Providence and Boston Railroad has introduced a time-saving device in charging the cylinders of its gas-lighted cars. Formerly, cars were held at Stonington until their reservoirs were filled, a proceeding which frequently caused delay. Now, a car containing five large reservoirs has been put in service. This is charged at the Stonington gas plant in the company's yard, and the car is taken to New London, the car being charged while cars are waiting at that station, and obviating unnecessary delay.

The Edison Electric Light Company propose to lay an underground line through Thames street, Newport, which will be

connected with their station on the hill by a pole line via Church street. Although the city authorities have not given permission to lay the wires, which they have no right to do, the company having never received a charter, it is understood that they will make no objection, and already the paving blocks along the east curb of the street are being removed so that the trench for wires may be dug.

The contract for lighting the new steamer Puritan, of the Fall River Line, has been awarded to the Edison Electric Lighting Company. There will be 1600 lamps of 16 candle-power each, for which current will be furnished by four 400 light dynamos. Two "straight line" engines will be motive power for the plant. The steamers Bristol, Providence and Pilgrim, of this line are also lighted by the Edison system, Armstrong & Sims engines being used as the driving power.

The improvements of the New York, Providence and Boston Railroad Company in and about this city have been extensive during the past three or four years. The latest improvement under way is the purchase of land between the railway and the projection of West Exchange street. It is a narrow tract on the south side of the railroad, containing four acres, or 174,240 square feet, and is undoubtedly the largest piece of land that has changed hands in this city for a long time. The company have begun their improvements by building a new engine-house, which will contain stalls for 20 engines, while from the building to the Atwell's avenue bridge tracks will be laid, principally for freight cars which are to be unloaded.

The Corliss Mfg. Company of this city have just finished three large boilers for the City Mfg. Company, of New Bedford, Mass.

LEONIDAS.

The Jennings-Beale Case.

The Supreme Court, at Pittsburgh, heard arguments on the appeal of B. F. Jennings, John Davis and T. D. Jenkins from the Court of Common Pleas, of Armstrong County. Joseph G. Beale, together with Robert Flenniken and the defendants, formed the iron firm of Jennings, Beale & Co., Limited, which was engaged at Leechburg in manufacturing steel billets of the Siemens-Martin open-hearth process. In July last Beale filed a bill in equity against the other members in the firm, alleging that they were about to move the works without his consent at a cost of \$20,000, which would work him irreparable injury. This, it was claimed by Beale, was in violation of the partnership articles, and, as he had lost confidence in the defendants, believing they were attempting to ruin the business, he asked for an injunction and the appointment of a receiver. The Common Pleas Court granted an injunction, and from this decision the defendants appealed. The defendants alleged that Beale, as manager of the works, was incompetent, and for that reason and because of trouble with the Amalgamated Association, a majority of the firm considered it advisable to remove the furnaces to some place near the residence of the Chairman, B. F. Jennings, that he might personally supervise the manufacture of the billets. The allegation that the defendants were trying to ruin the business is stoutly denied. The counsel for Mr. Beale intimates that the defendants are endeavoring to squeeze Beale out of the firm, and alleges that the trouble with the Amalgamated Association was occasioned by Mr. Jennings recklessly discharging men and precipitating labor troubles on the firm, which could have been avoided by a removal to Allegheny County. It is further alleged that Mr. Jennings became so reckless that he began dismantling the furnace and loading it on cars for transportation before he had

secured a site for its re-erection. This removal would cost \$25,000 to \$30,000, the foundations would be a total loss and the new plant would involve an additional and needless expense of \$23 per day.

The troubles in the management of this firm were before the Supreme Court at its recent session, in Philadelphia.

Torpedo Boats.

The naval maneuvers of 1887 abroad confirmed the opinion formed in 1886 that torpedo boats of small tonnage are not adapted for service at sea, and that their field of operations is restricted to operations on or near the coast and in harbors. The tendency at present is to build boats exceeding 130 feet in length, with displacements ranging above 90 tons, carrying machine and rapid-fire guns in addition to the torpedo armament. European powers have begun but a comparatively small number of torpedo boats during the present year, although a large number have been added to the strength of the fleets; but these have, in a majority of cases, been completed in fulfillment of old contracts. In general, it may be fairly said that the smaller type of torpedo boat, so highly thought of in 1885, has lost much of its prestige. The principal sources of weakness in the smaller boats have been found to lie in inefficient boilers and light construction of hull. A new boiler, invented by Messrs. Thornycroft & Co. has been largely adopted, and is giving very satisfactory results; and the tendency to work more material into the construction of the hull and protection of vital parts bids fair to overcome the second weakness noticeable in the earlier boats, in which so much was sacrificed for speed. The necessity of torpedo repair and supply vessels again made itself apparent during the naval maneuvers. In England a large and powerful vessel, the Vulcan, is building, and in Italy two vessels of this class are to be built. The Germans have appreciated the value of this class of vessel for some years, and have constructed division torpedo boats. These vessels are fitted with complete workshops and spare stores and are intended to accompany divisions of torpedo boats.

The difference of the speed of torpedo boats on trial and in actual service, almost always considerable, was well illustrated in the races of the English torpedo flotilla in the Channel, in which the victor attained a mean speed of but 16.25 knots per hour for five hours, while on the original measured mile it realized a speed of 21 knots. This was also illustrated in the competitive trials of Russian torpedo boats of various types in the Baltic in September last, the loss of speed amounting to $2\frac{1}{2}$ to 4 knots in boats but a year old. The single exception known to this rule is that of the Normand boat Sveaborg, which realized in this trial its original trial speed. The trials of the Nordenfjeldt submarine torpedo boats in England and Turkey have attracted considerable attention, and mark a new phase in torpedo warfare. Their present under-water speed of 4 or 5 knots is very low for efficient service against ships under way; but the attention of inventors and naval constructors is now directed to this type of boat, and doubtless it will be largely developed in the future. In a circular recently issued by the U. S. Navy Department calling for proposals for a submarine torpedo boat an under-water speed of 8 knots is deemed requisite. This circular probably indicates the most advanced thought and opinion in regard to submarine boats.

The Norway Steel and Iron Company of Boston, have decided to wind up their affairs and go out of business.

Iron in South Carolina.

South Carolina has so long been considered a purely agricultural State that it will be something of a surprise to many of the readers of *The Iron Age* to learn that almost as large an area of the State covers deposits of iron as constitute the iron region of Alabama, magnetic and specular ore are found in quantities on the Western slope of King's Mountain, in York, Spartanburg and Union Counties, also in Chester and Abbeville and in lesser quantities in many other counties of the State. Brown hematite is present in Pickens and Spartanburg Counties, and bog-iron ore can be found in every county in the State.

A century ago the iron mines of South Carolina were profitably worked, at which time there were seven furnaces in operation in the four counties of York, Anderson, Greenville and Spartanburg. The discontinuance of the industry was due in part the absence of cheap fuel, an obstacle which is now removed by the increase of railroad facilities and the development of coal mining at not a great distance.

The earliest record of iron making in South Carolina was in the year of 1773, when iron works were erected by Mr. Buffington, and which were destroyed by the Tories during the Revolution. Soon after the war several furnaces and forges were constructed, the more prominent being the Era and Etna Furnaces, in York County. The Era was erected in 1787 and the Etna the year after. The principal owner of these furnaces was William Hill, who is said to have invented a new blowing apparatus, which dispensed with the use of wheels, cylinders or other kinds of wind-producing apparatus. In 1802 an air furnace was built on Charleston Neck, and in 1810 there were two bloomeries in Spartanburg County, four in Pendleton, two in Greenville and one in York. About this time there was a small steel furnace and a nail factory. Five years later York County had, in addition to the plant already mentioned, a forge, a furnace, a rolling mill for making sheet iron, and a nail factory; and there were small iron works in several other localities.

As late as 1856 South Carolina had eight furnaces—one in York, one in Union, and six in Spartanburg County. Four of these furnaces then in operation produced 1506 tons of charcoal iron. The same year there were also three rolling mills—one each in Spartanburg, Union and York counties, and the three turned out 1210 tons of bar iron and nails. There were a couple of bloomeries in the State the same year. All of these furnaces and mills have since been discontinued on account of cheap methods of making iron having been inaugurated elsewhere.

The Magnetic Iron and Steel Company, recently chartered by the Secretary of State at Columbia, has purchased the greater part of the magnetic iron ore lode near the town of Blacks, in York County. The price paid for the property was \$60,000. The tract contains a large deposit of magnetic ore, low in phosphorus and silica. The company is composed of wealthy capitalists from Birmingham and Atlanta. It is their intention to build a furnace at once, and afterward a rolling mill, which in turn is to be followed by other industries. A town is to be laid off, and a boom systematically worked up, and none know how to do this so well as the Birmingham gentlemen interested in this project, which is freighted with so much importance to the iron future of South Carolina.

The new Charleston, Cincinnati and Chicago Railroad runs through the lands of this company and the officials of this road claim that they can deliver coal to the furnaces of the new iron company at \$2.50 a ton. There are large forests of

pine upon the lands of the company from which charcoal can be obtained, sufficient to supply the needs of a charcoal furnace. In close proximity to the ore beds purchased by the Magnetic Iron and Steel Company are also extensive deposits of Oolitic limestone. The Chesaw Iron Works will shortly begin the erection of a new brick foundry 90 x 30 feet.

A Travelling Crane Worked by Electricity.

It has become a custom with the mechanical section of the British Association to devote the Monday to papers connected with electrical engineering. The first paper read on that day was by Mr. W. Anderson, who described a 20-ton traveling crane worked by electricity. One of the traveling cranes in the foundry of the Erith Iron Works was originally constructed to be worked by hand; but preparations had been made to apply wire rope driving at some future time. The crane is 39 feet 6 inches span, and consists of a pair of wrought iron girders resting on end carriages running on an elevated line of rails. The gearing for hoisting and longitudinal and cross traverse is on the top of the main girders, the hoisting chain passes from the barrel at one end over a pulley at the other, then back to the pulleys in the cross traversing carriage, which runs between the main girders, through a falling block, and thence to an anchorage under the barrel at the extreme end of the main girders. By this arrangement the crane occupies a moderate height, and the hook can come within 3 feet of each wall.

The inconveniences and wear attending the employment of rope driving gear induced the author to try whether electricity might not be used with advantage. Messrs. Elwell-Parker, of Wolverhampton, were communicated with, and undertook to supply the dynamo and a motor suitable for the peculiar requirements of a heavy crane. The dynamo, which was intended to give 50 amperes at 120 volts with 1200 revolutions, was fixed in the main boiler house of the works, and was driven by a small horizontal engine by means of a link belt. The leads from the boiler house up to the conductor in the foundry are of 6 B.W.G. copper wire, while the conductor is formed of an angle iron bar 2 x 2 inches by 1/4 inch, extending the whole 350 feet length of the shop, and has one face roughly ground and protected from rust by vaseline. The return current travels along one of the rails on which the crane runs. The motor, which is shunt wound, and constructed for 100 volts and 50 amperes, is fixed on the working platform of the crane beside one of the main girders. Its driving spindle carries a steel pinion which gears into a double helical spur-wheel keyed on to a shaft which runs longitudinally on the top of the girder, and is connected by nests of three bevel wheels, with friction clutch connections to the three shafts which command the several movements of the crane; the means of using the hand power being still retained. Two sets of speeds are arranged for each of the movements, viz.:

	Feet per minute. Slow.	Feet per minute. Fast.
Hoisting.....	3.4	10
Cross traverse.....	25	105
Longitudinal traverse.....	78	213

To provide against undue strains upon the motor an automatic magnetic cut-out is fixed on the crane, in addition to a fusible cut-out in the main leads, and for the purpose of varying the power and speed to meet the requirements of the foundry, a set of resistance coils is provided, governed by a special switch, by means of which different resistances can be introduced into the armature circuit of the motor, or the

current can be cut off altogether; but so that it must be done by steps, and not suddenly, the connection between the motor and the conductors is by means of brushes pressed against them by elastic attachments. The handles for operating the several movements, the brake lever, the switch and the automatic cut-out, are collected together, so that a single attendant can readily work the crane from one spot. The crane was set to work in June last, and has continued to act satisfactorily ever since. As far as can be judged at present, there is no special wear to apprehend. The conductors act satisfactorily, though a considerable length is in the open air, and the dust, heat and smoke of the foundry do not appear to affect the working.

A New Heavy Grade Railway.—A correspondent of the *Times* gives an interesting description of the Brünig Railway, which has recently been opened between Lucerne and Bernese Oberland in Switzerland. The gradient is in places very steep, being as much as one in eight; and on this account special precautions had to be taken both in the up and the down journeys. Generally speaking, the Rigi system has been adopted. The locomotive turns a cog-wheel which runs on a toothed rack placed between the rails, and so the train slowly travels, or rather is dragged up hill. The cog-wheel is stopped, and the engine works in the ordinary way when a moderate gradient or level piece is met with. To check the too rapid descent of the train, the engine is fitted with a pneumatic counter-pressure action brake, which of itself is sufficient to stop the train. Besides this, each vehicle in the train is fitted up with a cog-wheel and rack similar to those used in the ascent, with drums on the axle to which clip-brakes are applied. By these appliances the speed can be regulated and the train stopped at any moment. There was another danger, however, incident to all railways to be encountered—namely the risk to the couplings during an ascent. Though the brakes on each vehicle would probably be sufficient in such a case, yet it was thought fit to take further precautions. When the train is at rest the brake is kept fully applied by heavy weights. These weights are lifted by steam-power, which is conveyed from the engine in flexible tubes. If a coupling breaks, the flexible tube conveying the steam also breaks, and the weights fall down automatically and check the motion of the carriages. It only remains to say that the gauge is a very narrow one, being only 1 m.

The report that the Kishpaugh mine, in New Jersey, has been abandoned because the vein had cut out proves to be incorrect. The facts are that the underground workings had gotten too far from the present slope to enable the managers to work economically. They have merely abandoned the old workings, the mine to be reopened on another part of the property when the iron business in New Jersey is in better shape.

In our description of the Loomis fuel gas plant at Tacony, Pa., published in *The Iron Age* of September 27, page 458, we stated erroneously that the exhaustor used was a No. 3 Root. The size is No. 6, having a 12-inch inlet, while No. 3 has only a 6-inch inlet.

The Lorain Mfg. Company, of Lorain, Ohio, have completed and are now occupying the additions to their plant made this summer, consisting of a planing mill 100 x 50 feet, for supplying the bathtub department, together with an iron foundry 200 x 90 feet, for increase of soil-pipe output. Their floors now cover an extent of three acres.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 96 and 97 Washington St.
CHICAGO, October 22, 1888.

Pig Iron.—No material change has occurred since our last report, but there seems to be a little more inquiry and the volume of business is a trifle larger. As yet the situation offers no comfort to the buyer who is looking for lower prices, but, on the contrary, the position of sellers is steadily growing stronger. The jobbing foundries are increasing their consumption, if anything, and, though the large contracts for Castings, mentioned last week, are still in abeyance, they are confidently expected to be secured for this city. In the meantime the supply of Pig Iron is diminishing, according to the latest authentic information concerning stocks in makers' hands. In the month of September the decrease in stocks of Coke Pig Iron held in the West was no less than 15 %, notwithstanding an increase in production. A similar condition of affairs exists in the Lake Superior Charcoal Iron trade. The total stocks are but half as large as those held by makers six months before. In view of these facts the resumption of operations by turnaces which have been out of blast for repairs, or because of unremunerative prices, need excite no apprehension of an immediate decline in values. It would appear that their product is really needed to supply the actual requirements of consumers. Some brands of Southern Coke Iron which had been withdrawn from this market are again being offered here, but in limited quantities. American Scotch (Blackband) Irons are practically out of buyers' reach, the furnaces being sold up for the present, and about \$22.50 being asked for No. 1 for future delivery. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$20 @ \$21; Alabama Car-Wheel, \$26.25; Jackson County Softeners, No. 1, \$18 @ \$18.50; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; other Ohio Soft Irons, No. 1, \$17 @ \$18; Lake Superior Coke, No. 1, \$18 @ \$19; No. 2, \$17 @ \$18; No. 3, \$16 @ \$17; Southern Coke, No. 1 Foundry, \$17.75 @ \$18; No. 2 Foundry and No. 1 Soft, \$17.25; No. 3 Foundry and No. 2 Soft, \$16.50; Gray Forge, \$16.

Bar Iron.—Specifications for Car Irons are now making their appearance and some orders have already been placed. Mills quote 1.80¢ @ 1.85¢, flat, f.o.b. Chicago, for this business, but buyers allege their ability to find takers at 1.75¢. Contracts for more cars are on the carpet, and the mills are inclined to maintain their prices for Bar Iron in view of the large demand still to come from this source. While the miscellaneous demand for Bar Iron is not very heavy, consumers appear to be more urgent than usual for the prompt delivery of small lots. Jobbers are profiting from this state of trade and are running off their stocks rapidly. On ordinary specifications the mills quote 1.65¢ @ 1.70¢, f.o.b. mill. for Common Iron, half extras. Small lots are quoted at 1.90¢ @ 2¢ from store, according to quantity and quality.

Structural Iron.—Deliveries are being made on old contracts, but new business is very light, as is usual at this season. Small lots from store are quoted as follows: Angles, 2.35¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢. On mill orders the following rates are named: Angles, 2.20¢ @ 2.25¢; Universal Plates, 2.25¢; Tees, 2.55¢ @ 2.65¢; Beams and Channels, 3.40¢.

Plates, Tubes, &c.—Business has improved very considerably in the past ten

days. With the approaching close of the navigation season, marine work is looking up, as repairs will be made when vessels go into winter quarters. The outlook for Tank and Boiler work is very good, as many contracts are now being figured on, and some good orders, particularly for Tank Iron, have already been booked. Store trade was much heavier than usual during the past week. Prices are firmly maintained all along the line. We quote prices from store as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢ @ 2.70¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 % off.

Sheet Iron.—The urgency of the demand for light gauges is now about over, and the mills are getting their business in better shape, making shipments more promptly and taking new orders at more reasonable prices. Small lots from store are still held at 3.20¢ for No. 24, 3.30¢ for Nos. 25 and 26, and 3.40¢ for No. 27.

Galvanized Iron.—Manufacturers' agents report new business quieting down, but deliveries on old contracts are still far in arrears, and they are experiencing much difficulty in supplying their customers. Stocks are so badly broken that it will take some time to put the warehouses here in condition to meet the demands of the pick-up trade. Small lots are still quoted at 60 % off for Juniata and 60 and 5 % off for Charcoal.

Merchant Steel.—Some heavy orders for Spring Steel are reported to have been placed during the past week, and the demand has been very good among general consumers. The volume of business is considerably heavier than that of September. Association prices are still as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Spring, 2.90¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—The only business now in progress consists of small lots for the absolute requirements of the roads. Orders for next year are discussed, and from 75,000 to 80,000 tons will be purchased in the course of the coming month for such delivery, if present indications do not prove false. So far but one company is known to have ordered a supply of Rails for 1889. Although makers do not anticipate a large business next year, the fact cannot be overlooked that the situation is more encouraging than it was at this time last year, when no railroads whatever were anticipating their wants. Quotations continue at \$30 @ \$31.

Old Rails and Wheels.—No transactions have transpired in Old Iron Rails, the views of buyers and sellers having been too far apart for business. An offer of \$23.50 for 500 tons was refused by one holder, and \$24 was rejected by another. Old Car-Wheels are nominally quoted at \$19.50 @ \$20.

Scrap Iron.—A sale of 1000 tons of No. 1 Forge is reported at \$20. Old Horseshoes and Cast Machinery have met with some demand, and there have been free sales of low-grade Cast. Old Material is not at all abundant, and holders of Mixed Country Scrap ask \$15. Selling prices of carefully selected Scrap are as follows, per ton of 2000 lb: No. 1 Forge or Railroad Shop, \$20 @ \$20.50; Track, \$19 @ \$19.50; Horseshoes, \$20; Axles, \$26.50; No. 1 Mill, \$15.50 @ \$16.50; Pipes and Tank, \$12 @ \$13; Light Wrought, \$11; Cast Machinery, \$15; Stove Plate, \$12; Cast Borings, \$10; Wrought Turnings, \$12.50 @ \$13; Axle Turnings, \$15.50; Coil and Leaf Steel, \$17; Locomotive Tires, \$15.50.

Hardware.—Wholesale merchants generally are busier than they were last week and are doing a more satisfactory trade than in September. The demand then ran largely into heavy goods, while now more Shelf Hardware is moving, making the aggregate of sales greater. An effort is being made to advance the price of Nuts, and the quotations sent out by different manufacturers seem to corroborate the report to that effect. Inquiries for Nuts and similar goods are increasing, as is always the case on an advancing market. Washers, however, are a drug, the demand for them being very light. Collections are improving and are very satisfactory in numerous sections.

Nails.—Manufacturers' agents report a scattering demand, which, however, has made a fair volume of trade in the aggregate, without special activity. Wire Nails seem to be moving a little more freely than Cut Nails, both from factory and store. Manufacturers' prices are now \$1.90 @ \$1.95, f.o.b. Chicago, for Steel Nails, and \$2.55, same delivery, for Wire Nails. There are influences at work in the Cut-Nail market, however, which bid fair to demoralize manufacturers' prices very seriously if an understanding is not soon reached. The regular price for small lots from store is \$2.10 for Steel Nails, and \$2.60 for Wire Nails.

Barb Wire.—Business is stagnant, and jobbers' prices are unchanged at 2.90¢ for Painted and 3.60¢ @ 3.65¢ for Galvanized.

Pig Lead.—Business has been at a standstill, in consequence of the failure of N. Corwith & Co., who came to grief as a result of their efforts to corner the supply of Lead. The local interests in Lead and its products do not seem to have been seriously affected, but it will take some little time to ascertain the full consequences of the failure, and meanwhile all parties will proceed cautiously. An impression prevails that the firm will be found to have assets sufficient to discharge their liabilities.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St.
PHILADELPHIA, Pa., October 23, 1888.

Pig Iron.—There is no perceptible change in the condition of the market, demand and supply being very evenly balanced. The feeling is one of steady firmness, consumers' requirements being sufficiently urgent to keep them continually in the market; and, as producers have no difficulty in placing their entire output, prices are naturally firm. In some cases sellers claim to be getting a little more money, which may perhaps be the case for small lots, quick delivery, but there are no indications of such a tendency in the general market. As already stated, prices are firm, but buyers are not inclined to contract for deliveries beyond the balance of the year, so that for the present values are not likely to show much change. A great many orders are said to be waiting for the result of the elections, and with the generally satisfactory condition of business it is thought that prices will advance if the Republican candidate wins. But the supply of Iron is very large, and will probably be larger still under the contingency mentioned, so that there may be some disappointment in regard to the matter of higher prices. And for the same reason there may not be the immediate decline which some people are predicting in case of a Democratic success. Apart from politics, the business is very satisfactory and for the time being there is no apparent reason for its being otherwise, hence the chances are that the volume of business will be large and prices steady, no matter who is elected. Meanwhile business in Pig Iron as regards future de-

liveries is held in abeyance, until matters are decided pro or con, prices being from \$16 to \$17, at tide, for Gray Forge; \$17 @ \$18 for No. 2 Foundry, and \$18 @ \$19.50 for No. 1, the majority of transactions being at medium figures, unless for strictly choice brands, which command outside prices. The scarcity of local Irons has been sufficiently marked to permit several lots of Southern and Western makes to be brought in, at prices within the limits above named, but the quantity taken was not large.

Blooms.—Fairly active at quoted rates, as follows: Nail Slabs, \$29 @ \$29.50, at mill; Billets from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 for "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$30 @ \$31 for Nail Slabs; \$34 @ \$36 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—The scarcity continues, and good Bars would command \$30 delivered, although some sellers quote \$30.50 firm. Latest sales reported were at \$29.50 @ \$30, but it might be difficult to duplicate purchases in the present firm condition of the market.

Bar Iron.—There is a renewed inquiry for Bars from car builders, with prospects of several large lots being closed in course of a few days. Country and Western mills are said to have named low figures, but city mills are still firm at last week's prices, with a good deal of work to be got out within the next four or five weeks. Still, buyers can probably do a shade better than last week, as the capacity in operation requires an enormous amount of business, which manufacturers are willing to accept at about to-day's prices, say from 1.8¢ to 1.95¢, according to quantity, quality, specification of sizes, &c. Skelp Iron is firmly held at from 1.95¢ to 2¢, with several large sales reported at the inside figure. The demand does not appear to have been fully satisfied yet, and 2¢ is asked for early deliveries.

Plate and Tank Iron.—The week's business has been fairly satisfactory to sellers, but no changes in prices have been made, although they are somewhat firmer than they were during the early part of the month. The general demand for Plates has been very good, but the activity at the mills is largely due to this class of trade—viz., carload up to 50 or 100 ton lots. Large orders are expected to be on the market at an early date, chiefly from the shipyards, which, when secured, will give the mills a good start for their winter work. Prices are quoted as before—viz., Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Sheet Iron.—A very heavy demand is reported, and mills are all completely cleaned out of stock. They are now running to their full capacity, endeavoring to meet the calls made upon them, but find great difficulty in doing so. Prices are firm at about the following for the best makes:

Best Refined, Nos. 26, 27 and 28.... 3¼ @ 3½¢
Best Refined, Nos. 18 to 25.... 3 @ 3½¢
Common, ½¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28.... 4¼ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25.... 4 @ 4½¢
Best Bloom Sheets, Nos. 16 to 21.... 3½ @ 3¾¢
Blue Annealed..... 2.8 @ 3 ¢
Best Bloom, Galvanized, discount..... 62½ %
Common, discount..... 67½ %

Structural Iron.—There is no improvement in this department, new business being very much less than the current output. Many of the larger mills are running on short time, and, as far as we can learn, none are engaged up to their full

capacity. New work is being talked about, but it is hardly likely that much business will be done until after the election. Meanwhile prices are unchanged, as follows: 2.10¢ @ 2.15¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.8¢ for Beams and Channels, Iron or Steel

Merchant Steel.—There is a good demand for all grades, and without change in prices, which are as follows: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Open-Hearth Ordinary Spring, 2.7¢ @ 2.9¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—The demand is almost exclusively for small lots, for which \$29 @ \$29.50, at mill, is asked. Orders for 500-ton lots and upward might be taken at the inside figure, possibly a shade less for winter delivery, but \$30 is asked for spring deliveries. The feeling is a little conservative on both sides, although the probabilities of lower prices are somewhat remote.

Old Rails.—No change whatever. There are buyers at \$23 @ \$23.50 and sellers at \$23.75, in store, or \$24 for shipments, but no transactions have been closed in this market so far as known.

Scrap Iron.—Good demand for all descriptions, and sales at about the following quotations: \$21 @ \$21.50 for cargo lots; \$21.50 @ \$22.50 for carload lots, delivered, or for choice \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—The demand is less urgent than it was a week ago, but manufacturers have plenty of orders on their books, so that prices are steady and unchanged. Discounts are as follows: Black Butt Welded, 52½ ¢; Galvanized do., 42½ ¢; Black Lap-Welded, 62½ ¢; Galvanized do., 52½ ¢; Boiler Tubes, 60 ¢.

Nails.—The demand is very slow, and prices as irregular as ever. Quotations are supposed to be from \$1.95 to \$2, but there is neither firmness nor uniformity in prices at present.

Pittsburgh.

Office of The Iron Age, 77 Fourth Ave.,
Pittsburgh, October 23, 1888.

The condition of the Iron and Steel industries has undergone no important change during the past week. Some branches of the Iron trade have been in an unsatisfactory condition all this year; the Nail trade has been very poor, and so much are some of our manufacturers dissatisfied with it that they have about concluded to abandon the business and turn their attention to something else which promises a better return. Then there is the Wrought-Iron Pipe trade; the mills have all been busy for several months past, but prices continue irregular and unremunerative, and the same is true of Steel Rails.

Pig Iron.—There has been very little change in the general situation during the past week. Business continues fairly active, while prices remain unchanged. There is not the activity there was a couple of months ago, nor is it to be expected in view of the fact that consumers generally are well stocked, while producers are well sold, so that the one is an offset to the other; many of the former have covered their requirements for the rest of the present year, and many furnacemen have contracts that will fully absorb their entire production during the time in question. It is the opinion of well-informed opera-

tors that there will be but little change in the general position of the market during the remainder of the present year. The consumption continues large, but so is production, and the latter is liable to be increased, as there are still some idle furnaces which can be started up. There is a continued absence of speculation. We quote prices as follows:

Neutral Gray Forge.....	\$16.00 @ \$16.50, cash.
White and Mottled.....	15.00 @ 15.50, "
All Ore Mill.....	16.50 @ 17.00, "
No. 1 Foundry.....	18.00 @ 18.50, "
No. 2 Foundry.....	17.00 @ 17.50, "
No. 1 Charcoal Foundry.....	23.50 @ 24.00, "
No. 2 Charcoal Foundry.....	21.00 @ 22.00, "
Charcoal Mill.....	19.00 @ 20.00, "
Cold Blast Charcoal.....	25.00 @ 26.00, "
Bessemer Iron.....	18.00 @, "

Bessemer Iron is offering more freely, and, with consumers pretty well stocked, the market is weaker. One broker reports having 3000 tons to sell at \$18, cash, but is unable to find a buyer. We can report a sale of Low Phosphorus at \$20, and Low Silicon at \$17.50, both cash; for standard brands of Mill Iron \$16.50, cash, is an outside price.

Muck Bar.—Is still quoted at \$28.50 @ \$29, cash, with a sale of 900 tons reported at \$29.75.

Spiegel.—We can report a sale of 30 % Spiegel at \$33, cash, and of 80 % Ferromanganese at \$56.50, cash.

Manufactured Iron.—Manufacturers report little or no change in the general position of the market during the past week; there is a continued good degree of activity, although orders are mostly small, indicating that buyers are not generally inclined to anticipate future wants. However, the mills are all in operation, and there is a large business in the aggregate, with indications that it will keep up throughout the winter. Prices remain unchanged. Bars, 1.80¢ @ 1.85¢; Plates, 2.20¢ @ 2.25¢; No. 24 Sheet, 2.85¢ @ 2.90¢, all 60 days, 2 % off for cash; Skelp Iron is still quoted at 1.85¢ @ 1.90¢ for Grooved, and 2.10¢ @ 2.12¢ for Sheared.

Nails.—There is no improvement in the Nail trade. Demand continues very light for the season and there is not likely to be any improvement until the spring trade. Prices are unremunerative, although full card rates are being realized. We continue to quote 12d to 40d at \$1.90, 60 days, 2 % off for cash. The Nail trade of Pittsburgh has dwindled down to very small proportions as compared with what it was years ago.

Wrought-Iron Pipe.—While orders are possibly not coming forward so freely, the mills are all pretty fully employed and likely to be this month and November, but prices continue unsatisfactory. The great trouble in this particular branch of the Iron business is a lack of organization and co-operation, and without it it is almost impossible to have satisfactory or uniform prices; for a year past each firm has been making its own prices, independent of each other. Discounts remain about as last quoted, as follows: On Black Butt-Welded Pipe, 52½ ¢; on Galvanized do., 45 ¢; on Black Lap-Welded, 62½ ¢; on Galvanized do., 52½ ¢; Boiler Tubes, 60 ¢ off; 2-inch Tubing, 13¢ per foot net; 5½-inch Casing, 40¢ per foot, net.

Old Rails.—The only sale reported during the week was a lot of 4000 tons American Tees, at \$25, cash, which may be regarded as the ruling price. Consumers generally are pretty well stocked, but the offerings are not large and holders are not pressing the market; they are not apprehensive of any immediate decline and are hopeful that the market may take a turn the other way.

Steel Rails.—There is no improvement in price; heavy sections are still quoted at \$29, cash, on cars at mill in Pittsburgh. (The new mill of the Allegheny County

Bessemer Steel Company will, it is expected, be ready to start up about the 1st of the new year.)

Billets, &c.—Sales Bessemer Steel Billets, at \$29.50, cash, at maker's works, and Nail Slabs, at \$28.75 @ \$29; Rail Ends and Bloom Ends quoted at \$19 @ \$19.50.

Merchant Steel.—There was a meeting of the Bessemer Steel Association the other day, but there was no change made in prices. Best Brands of Tool Steel, 8½¢; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Open Hearth Steel, 2½¢.

Railway Track Supplies.—Trade continues light, no change in prices. Spikes, 2¢, 30 days, delivered; Splice Bars, 1.80¢ @ 1.85¢; Track Bolts, 2.85¢ with square and 2.95¢ with hexagon Nuts.

Old Material.—There is a fair business at unchanged prices. No. 1 Wrought Scrap, \$21, net ton; Wrought Turnings, \$14.50 @ \$15; Car Axles, \$26 @ \$27; Cast Scrap, \$16 @ \$16.50, gross; Cast Borings, \$12 @ \$13; Car Wheels, \$20; sale short pieces Steel Old Rails, \$18.50, gross.

W. H. Thompson and D. Summers, of Pittsburgh, have formed a copartnership under the style of the Pittsburgh Mineral Company, and will engage in the mining and shipping of the best grades of Manganese, Iron, Zinc, Lead Ores and Minerals. The office of the new company is located at No. 54 Fifth avenue, in the above-named city.

Samuel W. Hay, for a number of years with Howe, Brown & Co., Limited, Steel manufacturers, at Pittsburgh, has recently resigned his position with that firm and has located in the Hamilton Building, where he has commenced a general brokerage business in Metals and Ores. Mr. Hay has also secured the sole agency for the Sharon Steel Casting Company, of Sharon, Pa., and is prepared to quote prices on the manufactures of that firm.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, October 22, 1888.

Pig Iron.—The most prominent feature of the local market for Pig Iron during the past week has been strength. But, while the market has been strong, there has been only a moderate volume of business. The discussion of the tariff and the coming Presidential election fills all branches of the Iron interest and many are the inquiries concerning transactions based upon the outcome. No other interest, apparently, feels so keenly or so closely the questions involved in "protection" and "free trade," and not a few purchases are made upon conviction of the result, yet the general disposition is to be conservative and to make only new contracts to cover orders already placed. Production of Pig Iron is heavy and new furnaces, as well as old ones blowing in, are adding their contribution to the output; at the same time, stocks are reported to be declining, reflecting an almost unprecedented consumption. Information comes by wire from Pittsburgh that an advance in the price of Coke is about to take place, and that the Coke wage-workers will receive some benefit thereby. The recent advance in freight rates has only strengthened the market for Iron. The demand for Southern Car-Wheel Iron has been quite active, and one lot of 6000 tons has been sold at \$25, to be delivered 1000 tons per month for six consecutive months, delivery to begin in January, and 1000 tons No. 2 Southern Foundry has been sold at \$17, and 1000 tons do. at \$16.70, cash. 1000 tons Forge Iron sold at \$15.25, but the majority of the individual sales have been small in

amount. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$16.50 @	\$17.50
Southern Coke, No. 2.....	16.50 @	17.00
Southern Coke, No. 3.....	15.50 @	16.00
Ohio Soft Stone Coal, No. 1.....	17.00 @	17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @	16.00
Mahoning and Shenango Valley.....	17.50 @	18.50
Hanging Rock Charcoal, No. 1.....	20.50 @	22.50
Hanging Rock Charcoal, No. 2.....	19.50 @	22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @	19.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @	18.00

Forge.

Strong Neutral Coke.....	14.75 @	15.25
Mottled Neutral Coke.....	13.75 @	14.00
Gray Forge.....	14.50 @	14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @	25.00
Hanging Rock, Cold Blast.....	22.00 @	25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @	21.50

Nails.—The market has remained firm, with a moderate volume of business. Jobbing prices are based upon 12d @ 40d, which sell at \$2.10 ¢ keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2.10 and Steel Wire Nails at \$2.75 ¢ keg.

Manufactured Iron.—There has continued to be a fair volume of business, and a firm tone has prevailed for Bar, Sheet, and Structural Iron, with full prices realized: Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3¼¢ @ 4¼¢ ¢ lb.

Old Material.—There has been a better demand for Old Rails and the market has ruled steady, with sales of a few 100-ton lots, at \$23, cash. There has been but little call for Old Wheels, but the offerings have been only moderate and the nominal rates current are \$19 @ \$19.50, spot, cash.

Detroit.

WILLIAM F. JARVIS & Co., under date of October 22, report as follows: More inquiries and for larger amounts have been received during the week than for some time past, and what is more to the point, several orders for round lots of Lake Superior Charcoal have been placed. A large demand for high numbers still continues, and very few furnaces have any quantities of these grades unsold. Consumers are still asking for quotations for next year's delivery, and some furnaces refuse to quote at all, and others that are willing to quote ask from \$1.50 to \$3 per ton advance over present prices. Some Mahoning Valley furnaces are having trouble in shipping No. 1 Iron as fast as called for on old orders and are unable to offer for prompt delivery at any price. There is a great scarcity of cars, and this is a source of annoyance to shippers, as they cannot get cars promptly even when they have the Iron on hand. We report business as satisfactory and the outlook as favoring the furnaces, with quotations as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @	\$20.50
Lake Superior Coke, all ore.....	19.75 @	20.25
Lake Superior Coke, clinder mixed.....	18.50 @	19.00
Standard Ohio Black Band.....	19.75 @	20.25
Southern No. 1.....	17.75 @	18.25
Southern Gray Forge.....	16.25 @	16.75
Southern Silvery.....	17.00 @	17.50
Jackson County (Ohio) Silvery.....	18.50 @	19.00
Old Wheels.....	20.50 @	21.50

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, October 22, 1888.

Pig Iron.—Matters appear to have settled down into a sort of conservative waiting. This may be accounted for, in a measure, on the part of furnacemen, from the fact that there is a demand for all their output, and there appears to be little doubt that this will continue. Speculation seems to have dropped out of sight, for, so far as can be learned, there is not even

an inquiry from this class of customers. There have been term sales made for deliveries to run from January to July of the coming year at present current rates, and it is expected that before the year closes a very large proportion of the output will be so placed. The general opinion appears to be that the result of the election will make but little difference in prices or demand, although there is, of course, some anxiety expressed as to what the policy of the Government will be for the next four years. Freight rates on the lines reaching the Ohio River have been advanced again 20¢ ¢ ton, to take effect November 1, which, with the advance of October 1, of -15¢, makes now 35¢ to all points to the Ohio River and beyond over those of the summer.

Louisville.

LOUISVILLE, KY., October 22, 1888.

Pig Iron.—The market is quiet; prices are fairly held, and many buyers are willing to make purchase of Iron for extended delivery. Furnaces consider the situation satisfactory, and in many instances are accepting orders for future delivery. There have been a few large sales during the week in lots of 500 tons, these, however, at a slight concession in price. Some buyers think that after the Presidential election a decided improvement will take place, while others consider that the market will but hold its own, and that prices will remain at present figures. The demand for Old Rails has fallen off, and the market is decidedly weaker; Old Rails are held at \$23, and Old Wheels at \$21. We quote as follows:

Southern Coke, No. 1 Foundry.....	\$17.00 @	\$18.00
" No. 2.....	16.00 @	16.50
" No. 3.....	15.50 @	16.00
Hanging Rock Coke, No. 1 Foundry.....	17.25 @	17.75
Hanging Rock Charcoal, No. 1 Foundry.....	21.00 @	23.25
Southern Charcoal, No. 1 Foundry.....	18.00 @	18.50
Silver Gray, different grades.....	14.50 @	15.25
Southern Coke, No. 1 Mill, Neutral.....	14.75 @	15.25
" No. 2.....	13.75 @	14.75
" No. 1 "Cold Short.....	14.25 @	14.75
" Charcoal, No. 1 Mill.....	15.75 @	16.50
White and Mottled, different grades.....	13.50 @	13.75
Southern Car-Wheel, standard brands.....	23.00 @	24.00
Southern Car-Wheel, other brands.....	19.25 @	21.25
Hanging Rock, Cold Blast.....	22.25 @	25.25
Hanging Rock, Warm Blast.....	19.25 @	20.25

Cleveland.

CLEVELAND, October 22, 1888.

Iron Ore.—Eastern furnacemen have been in the market during the past week, and have bought liberally of such Ores as can still be obtained. Transportation rates are still surprisingly low for this time of the year, and charters from Escanaba to lower lake ports are made every day at \$1.25 per ton. With correspondingly cheap freights from Marquette, Ashland and Two Harbors, buyers are able to make their concluding purchases at prices quite in keeping with the quotations for Pig Iron. Menominee Ores, non-Bessemer quality, are held a little more firmly, sales at \$4.25 @ \$4.40 being reported, while Bessemer Ores from the same range bring \$5.50 readily, with a few lots of extra quality bringing \$5.80. Red Hematites, non-Bessemer quality, are selling for \$5.15 @ \$5.30, f.o.b. cars, Cleveland and lower lake ports. Lake and all-rail shipments from the upper lake districts closely aggregate 3,450,000 tons, and last season's totals are being rapidly overhauled. The market has a very healthy tone, and there is no indication of weakness anywhere. The mine owners are rushing down the Ore with all possible speed, and all available vessels will be kept busy until forced to tie up for the season.

Pig Iron.—While the demand been fairly active, with a satisfactory number of sales reported, the approaching election is having its effect upon the mar-

ket. The attention of manufacturers as well as of buyers and sellers generally seems to be directed toward the momentous question to be answered on the 6th day of November. Add to this the special interest which Iron men are taking in the result of the election and its relations to their own interests and it is not difficult to account for any existing dullness. While dealers do not anticipate any large orders until the middle of November, every condition of the market seems favorable for a good trade when the entire attention of both buyers and sellers can be given to it. Mahoning and Shenango Valley Mill Irons are in particularly good demand, while No. 1 Foundry is selling freely, buyers seeming to be anxious to increase their stocks before any advance in prices occurs.

Manufactured Iron.—Common Bar at 1.70¢ is in fair demand, while Sheets of every grade are very scarce.

Scrap Iron.—Old American Rails are still held firmly at \$25, with no considerable sales reported. Indications are not wanting, however, of a break, and this will be followed by very vigorous sales of accumulated stocks.

New York.

Office of *The Iron Age*, 65 and 68 Duane street.
New York, October 24, 1888.

American Pig.—The tone of the market has not changed perceptibly, the volume of business being small, though prices remain firm. Consumption is apparently going on at a heavy rate, the majority of furnace companies reporting that their deliveries are very heavy. We continue to quote Standard to Choice No. 1, \$18 @ \$19; No. 2 Foundry, \$17 @ \$17.50, and Gray Forge, nominally, \$16 @ \$16.50.

Scotch Pig.—The market is very quiet, with prices remaining: Coltness, \$21.50, nominally; Shotts, \$20.75 @ \$21; Langloan, \$21, and Dalmellington, \$20.25 @ \$20.50.

Plates.—We quote Iron Tank, 2.1¢ @ 2.2¢; Shell, 2.3¢ @ 2.4¢; Steel Tank, 2.2¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.65¢ @ 2.75¢, and Fire-box, 3.5¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢.

Bar Iron.—We quote: Carload lots, half extras, 1.65¢ @ 1.7¢ for Common; 1.7¢ @ 1.8¢ for Medium, and 1.8¢ @ 1.9¢ for Refined, with prices for fancy brands running up to 2.4¢ @ 2.5¢.

Steel Rails.—The only transactions of any magnitude are reported by one Eastern mill, aggregating 30,000 tons, of which 7000 tons are for a Southern road and 23,000 tons for Eastern roads, all 1889 delivery. The market is feverish, with a good deal of quiet work going on and much uncertainty as to the prices which are actually being made at mill both for this year and next. There seems to be little question, however, that low figures have been accepted. We quote \$27.50 @ \$28 at Eastern mill for large quantities, standard sections. There are a number of inquiries in the market, among them some from Eastern trunk lines. One of them for 4,000 tons of 80 pound rails and 6,000 tons of a lighter section is to be placed to-morrow.

Spiegeleisen.—We note sales aggregating about 5000 tons to an Eastern Rail mill at private terms. The market is irregular and difficult to quote. We quote: 80 % Ferromanganese, \$54 @ \$54.50, with a few small sales reported.

Wire Rods.—Some confusion has been created by offerings of foreign Bessemer Rods at \$38.50 @ \$39. Foreign Basic Rods may be quoted \$39 @ \$39.50 for forward delivery. It is reported that the German Wire Rod combination has broken, with little prospect of its renewal for the present.

Old Rails.—We hear of a sale of 600 tons of Foreign Tees at a price equivalent to \$23.50, Jersey City, and of a few smaller lots aggregating a little over 1000 tons, at private terms, to a manufacturer in the West. Negotiations for additional blocks are pending. We quote \$23 @ \$23.50 for Tees.

Metal Market.

Copper.—Spot Chili Bars improved since our last report from £78 to £78. 10/, and futures from £78 to £78. 15/, good merchantable from £77. 10/ to £78. 5/, Best Selected remaining unaltered £82. The following cable was received last week: "A preliminary agreement between the French syndicate controlling the Copper market and the Rio Tinto Copper Company has been signed. It is stated that negotiations have been concluded by which the contracts at present existing between the syndicate and the American companies will be renewed for a term of 12 years." Our own market was apathetic; two December contracts were sold yesterday at 17.70¢, but there were no further buyers. Spot and October are quoted 17.35¢ @ 17.40¢, and Casting brands 16¢ @ 16½¢.

Tin.—The London quotations came slightly better, spot advancing from £102 to £103 and futures from £102. 10/ to £103. 12/6. Total sales for the week, 790 tons. The Billiton sale at Batavia averaged 63 guilders ½ picul. As per cable from Gillilan, Wood & Co., Singapore, to Mr. Charles Nordhaus, East India agent, 89 Water street, New York, the shipments of Tin from the Straits Settlements to this country during the first half of October have been 450 tons, against 50 last year; and to England 700 tons, against 400; since January 1 they were, respectively, 2650 tons, against 4050, and 14,400 tons, against 10,400 tons. Sales in this market were confined to 105 tons at 23.05¢ @ 23.20¢ November, and 23¢ @ 23.05 December, the closing quotation being 23¢ November, and 22.85¢ December, 23.40¢ being asked on the spot, and 23.75¢ for October. The jobbing demand is moderate. **Tin Plates.**—During the past week only a moderate demand has been noticeable, which has been rather a disappointment to dealers, and prices are in some cases again easier. There is not much doing in futures, as the makers are still working on old orders and disinclined to meet buyers' views. The market in Liverpool is not over 13/6 for Coke Tins. We quote at the close to-day, large lines on the spot, Siemens-Martin Steel, Charcoal finish, \$5 @ \$5.75; Coke finish, \$4.70; Terns, \$4.20 @ \$4.35; Bessemer Cokes, \$4.45 @ \$4.50, and Wasters, \$4.25.

Lead.—Soon after our last week's report the failure of Messrs. Nathan Corwith & Co., New York and Chicago, was announced, news which fell on the Lead market like a clap of thunder, inasmuch as it came a great deal sooner than had been expected. That the speculation for a rise the firm was engaged in since the beginning of the year was extra hazardous was the opinion, we believe, of the majority of people in the Metal trade in this city, yet as the firm was considered, if not very rich, at least disposing of large means and credits, it was thought a collapse was not near at hand. But the disappointment felt about the fall trade and the consequent holding

back of consumers as buyers, deprived the speculation of a chance to get out at least square. As matters stand at present it is thought that the total loss of the firm will be found not to exceed \$400,000, and that, perhaps, it may be able to pay 75¢ to 80¢ on the dollar after winding up. It is believed the senior member of the firm will withdraw from the house and the Lead trade. Some estimate the present holdings of the house in store at not exceeding 10,000 tons, while others think it may be 20,000 to 25,000 tons, not counting future contracts with smelters. There is as yet too much confusion and guesswork to arrive at the precise status of the firm's position in its relations to the general Lead situation. There are powerful interests not to let Lead decline in the near future beneath 4¢, money having been advanced on Lead in store by banks and by prominent dealers. The smelters have bought Ores at high figures on their sales to arrive to Corwith. Manufacturers do not hold much beyond present wants, and, though their trade is not brisk, yet at about 4¢ they may be willing to replenish supplies, though but moderately. Sales have been from 4¢ down to 3½¢, and back to 4¢. The closing out of contracts under the rules has contributed about the weakest feature, and, till all are closed out, will continue doing so. Matters may, under the circumstances, remain more or less the same for some time longer. When the market will be left to shift for itself the larger production this year may be felt, and it may be found that the intrinsic value of Lead stands somewhere between 3½¢ and 3¼¢. In the aggregate the sales for the week foot up to 3300 tons at the Exchange alone, 2550 tons thereof being "under the rule" at the figures printed in our usual weekly summary elsewhere, the market closing 3.95¢ bid and 4¢ asked. How long the market will receive support from brokers, dealers and smelters and refiners remains to be seen. This year has been exceptional in the way of light consumption, though not in the way of a heavy output, since the prospect of further additions to the supply next year from the Rocky Mountains is spoken of as strong. Corwith took the surplus this year, which has not gone into consumption. He had contracted for future supplies, which must now seek a market again. The raw material being paid for, consumers will therefore act conservatively, since the outlook is in their favor, unless the demand for manufactured goods should develop in an exceptional manner during the dull season. London gave way all the way to £12. 5/ @ £12. 7/6, but comes to-day £13. 15/ Soft Spanish and £14 English Pig.

Spelter.—At the West Blende Ores remain as high as they ever were in this country—\$30 ½ ton—and some smelters hold at 5½¢ in New York, the current price paid in a moderate way being 5½¢ @ 5¼¢, while Silesian, which recovered to £19 in London, cannot be sold below 6½¢.

Antimony.—There is little Hallett here, while the demand is good at 10½¢. Cookson is strong at 12½¢ @ 13¢. Hallett remains steady in London at £42.

New York Metal Exchange.

The following sales are reported:

THURSDAY, October 18.

10 tons Tin, December.....	23.00¢
64 tons Lead, October.....	4.25¢

Coal Market.

The Anthracite Coal trade betrays some signs of weakness now that the pressure for early delivery has in a measure subsided, and especially in the face of a continued heavy production at the mines. For some of the domestic sizes alone is there any scarcity, while Broken and the small steam sizes are in excess at lower prices. The most striking feature is the enormous output, the total for the week ending October 20 amounting to no less than 968,540 tons, an aggregate rarely, if ever, surpassed. Compared with the previous week the increase is over 132,000 tons, and compared with the corresponding week last year the increase is 240,000 tons. Since January 1 the aggregate is 30,270,430 tons, against 27,554,975 tons for the same time in 1887. Wyoming alone last week put out 528,800 tons, an increase of over 90,000 tons. Consumers will not fail to notice the tendency to accumulation, and the probable effects of an excessive supply later in the year. Producers, on the other hand, intimate that restriction will be enforced so far as may be deemed necessary.

Quotations are unchanged—viz: Hard White Ash, Lump, \$4.50; Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Free-Burning, f.o.b., Broken, \$3.95; Egg, \$4.30; Stove, \$4.65; Chestnut, \$4.65; Pea, \$2.75. It is reported that considerable orders have been placed at a cut of 30¢ @ 45¢. Bituminous Coal is being used more generally for manufacturing purposes, and despite the increased production all receipts are quickly absorbed. For the week Cumberland reports 68,000 tons and Clearfield 62,500, while Beech Creek and Pocahontas each send about 30,000 tons. Pool prices are \$3.25, f.o.b.

Vessels are scarce and quoted \$1 to Boston, free of discharge.

It is stated that the Standard Cannel Coal Company, of Tennessee, have secured contracts to furnish for the different gas companies of New York City 20,000 tons of Cannel Coal from the mines at Newcomb. The Lehigh Valley Company will extend their Southern Central Division from Sterling Junction, on the northern border of New York State, to Oswego, one of the best markets of the State.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from October 13 to October 18, inclusive, and from January 1 to October 18, inclusive, were as follows:

Iron and Steel.

	Oct. 13 to Oct. 18.	Jan. 1 to Oct. 18.
	Tons.	Tons.

Financial.

While there is noticed no special activity in business circles, accounts are generally favorable as respects local trade, dry goods jobbers, grocery men and others reporting a tendency to improvement. There is more than usual desire to take advantage of low freights prior to the close of navigation, and in the Southern trade there is a decided increase, stimulated by the gradual disappearance of yellow fever. The approximation of the wheat market to normal prices is also a favorable omen. Under present conditions grain exports are practically suspended, excepting from the Pacific coast. Trading in wheat is slow, but speculation is encouraged by easier money. Spot cotton is dull and about steady. High rates at Southern ports operate to retard shipments. Chicago advices are that "the general mercantile trade is moving along fairly well, present prospects seeming to indicate that it will be protracted over a longer period than was anticipated earlier in the season. The unsettled state of the grain markets and the lateness of the corn crop is delaying collections more or less in some sections of the country. This, together with the shortage in the wheat crop, tends to retard buying to some extent." A notable feature of the times is the shortage of rolling stock on the principal railway lines. "On Saturday last," says the *Cleveland Plaindealer*, "the Nickel Plate was 3000 cars short, the Bee Line 1700 and the Lake Shore and other roads in the same condition. The pressure from the East seems to be lessening." A Pennsylvania railway official is reported as saying that it is almost impossible to place any new orders for locomotives at the present time, all the works being full, and the railroads of the country everywhere want more cars. Largely increased earnings are looked for when once the corn crop is fairly in motion. The gross earnings of 73 railroads for the first week of October show an increase of \$81,648, or 1.17%. The Chesapeake and Ohio Railroad has given orders to double its freight equipment, proposing to build up a great export business at Newport News by shading export rates.

The dullness of the Stock Exchange was relieved on Monday by the supposed consummation of the project long pending for the consolidation of important lines of Southern railways. The parties to the transaction are the Georgia Company, controlling the Central Railroad and Banking Company of Georgia and the Richmond and West Point Terminal Railway Company. President Inman, of the Terminal Company, says: "We have bought the Georgia Company's property. The details as to terms are not yet definitely settled, but it can be positively stated that the deal will go through. We obtain control through the purchase for cash of \$12,000,000 of the Georgia Com

pany's stock, for which \$4,200,000 is to be paid. The purchase will bind together under a single management all the railroad properties in that section of the South penetrated by the Terminal and the Central systems, the union being made more important by the leases of the East Tennessee, Virginia and Georgia, the Georgia Pacific and the Knoxville and Ohio railroads, which have been closed by the Terminal or its controlled companies. Our line of steamers from Savannah to New York will be established, which will give the consolidated system control of every important port in its territory." Large sales of Union Pacific were a feature of the week, this stock advancing on the improved financial statement of President Adams. The failure of Corwith & Co., of pig-lead fame, had an unfavorable influence. Chief among the depressing influences of the week was the unsatisfactory condition of Atchison, Topeka and Santa Fé affairs. On Saturday the bank statement stimulated a rise and the market closed buoyant. On Monday all securities represented in the Richmond Terminal advanced. Stocks were irregular on Tuesday, Richmond Terminal rising on news of the absorption of the Georgia Central system. The movement was less active in the afternoon, but the tone was strong, with Reading, Union Pacific and the grangers leading.

Government bonds were firm and in good demand—quotations as follows:

U. S. 4½s, 1891, registered.....	108¼
U. S. 4½s, 1891, coupon.....	108¼
U. S. 4s, 1907, registered.....	127½
U. S. 4s, 1907, coupon.....	127½
U. S. currency 6s.....	121¼

Commissioner Fink, of the trunk lines, has issued a circular announcing a decided advance in the west-bound rail and lake freight rates from New York to the West. The new rates from New York will go into effect on October 26. The present rates are 35¢ for first-class, and 30, 24, 17, 15 and 13¢ for the other classes downward. The new tariff advances these figures to 51¢ for first-class, and 45, 35, 24, 20 and 17¢ per 100 lb from New York to Chicago for the other classes.

The aggregate clearings of 38 cities during the week show a falling off of 2.8% as compared with the corresponding period last year; outside of New York, however, there was a gain of 12.1%; New York decreased 10.1%; Cincinnati, 5.7%; New Orleans, 0.7%; St. Paul, 15%; Columbus, 6.4%; Wichita, 16.5%; Norfolk, 8.1%; and St. Joseph, 21.1%. Boston increased 19.4%; Philadelphia, 6.9%; Chicago, 9.4%; St. Louis, 8.4%; San Francisco, 41.2%; Pittsburgh, 25.7%; Kansas City, 36.4%; Louisville, 11.8%; Minneapolis, 16.7%; Denver, 16.2%; Detroit, 17.3%; Cleveland, 15.2%.

The weekly bank statement was remarkable as showing an increase of \$6,586,000 in the surplus reserve, which now stands at \$16,901,025, against \$9,363,225 at the corresponding time last year and \$5,469,575 in the third week in October, 1886. The explanation is that the heavy bond purchases by the Treasury last week appear on this week's statement. The ability of the banks to meet any further demands that may be made upon them this autumn is not now questioned. Loans were contracted \$3,189,600; the specie increased \$9,231,300; the legal tenders are down \$791,200; the deposits other than United States are increased \$7,414,500. Demands from the South for crop purposes continue, while from the West some return shipments are noticed. Rates on time loans, most of which were made by out-of-town institutions, were 3½ to 4½ for three to six months for commercial paper, and rates were 4½ % to 5½ % for 60 to 90 days, 5 to 6 % for first class four months' commission house names.

The last Treasury statement shows that

up to date the Government has purchased under the circular of April 17, \$87,454,050 bonds, of which \$51,892,000 were 4s and \$36,062,050 were 4½s. These \$87,454,050 cost \$104,905,644. Had they been allowed to run to maturity they would have cost \$131,199,036. By their purchase now, even at a premium of \$2,838,064 for the 4½s, and \$14,613,539 for the 4s, the Government saves on the former \$1,850,002; on the 4s, \$24,443,138, or a total of \$26,293,392.

The posted rates for bankers' sterling are \$4.84½ @ \$4.85 for 60-day and \$4.88½ @ \$4.89 for sight. The market is dull and firm. In London the withdrawals of gold are temporarily checked, but Argentine and Russian demands are simply in abeyance, to be renewed at the first opportunity.

The imports of merchandise at this port last week were valued at \$8,634,000, of which something over \$2,000,000 represents dry goods. Since January 1 the total is \$377,640,000, against \$380,998,000 for the corresponding period last year and \$353,718,000 in 1886. The exports were \$5,903,091. Total since Jan. 1, \$237,697,000 against \$250,442,000 for the same time last year, and \$261,830,000 in 1886. The Empire State Bank, corner of Broadway and Bleeker street, James W. Conrow, president, will soon open for business.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Oct. 24, 1888.

Speculation in Copper has been very moderate the past week. The selling of futures has dwindled down to small proportions, and the demand for prompts from outside sources is necessarily small. Purchases for consumption have also continued light. In the absence of incentive the syndicate is doing nothing in a speculative way, apart from giving values a certain measure of support. Consumers, it is stated, are no longer bound by cast-iron agreement in making purchases. That is to say, they are now supplied with what Chili Bars they may require, at £78 @ £78. 5/, without giving a guarantee that the Copper will go into consumption. Sales of Copper Furnace Material have again been on a quite extensive scale, but the sellers are more than ordinarily reticent as to terms. Among recent sales Anaconda Matte figures to the extent of 1600 tons, and some 300 tons of American are also reported—all private terms. It is reported that the Rio Tinto Copper Company have signed a new agreement with the French syndicate, giving the latter the control of the company's product for a period of years. The report also has circulation that the negotiations pending with the leading American companies, involving the control of their output for twelve years from the expiration of existing contracts, have been concluded. No particulars are given as to terms, &c. The Bratsberg Company has sold their entire production up to June, 1889, at 13/ per unit.

The market for Block Tin has been very firm, mainly under the influence of continued active buying at the sources of supply. The stock here is still comparatively small and said to be concentrated in few hands.

In the Tin-Plate market there has been a very good business. Buyers and sellers

are considerably apart on prices, however, and transactions are restricted to a considerable extent. A large trade is anticipated as soon as prices settle. The Cwmfelin works have added two mills, and now have a total of twelve mills in operation. New mills are being erected by other companies. The wages question is creating more or less uneasiness, and it is stated that the makers are soon to hold a meeting in the interest of concerted action. The masters, it is asserted, have virtually agreed to combine, if their propositions are not accepted, and instantly close down all their works.

The Pig Iron market has been more active, and a variety of influences have come to the surface that tend to strengthen prices more or less. A scarcity of Coal has necessitated the banking up of several Scotch furnaces and thereby reduced the supply. There are also reports of a contemplated combination of Scotch and Cleveland pig makers, presumably to regulate the production. Regarding this alleged combination, nothing definite can be learned at the present time. Scotch Pigs have varied in price only to a very slight degree. Cleveland Pig has weakened a trifle, however, and Hematites, on the other hand, are higher. Freights are showing an easier tendency, more particularly from Glasgow.

Scotch Pig.—The volume of business has been fairly good and prices have ruled very steady.

No. 1 Coltness, f.o.b. Glasgow.....	49/6
No. 1 Summerlee, ".....	50/2

No. 1 Exlinton, ".....	41/6
Steamer freights, Glasgow to New York, 6/6	
Liverpool to New York, 10/.	

Cleveland Pig.—Business has been rather slow and the market is weaker. No. 1 Middlesboro', G.M.B., 37/; No. 3 do., 34/6.

Bessemer Pig.—Trade is showing* greater spirit and prices are firmer. West Coast brands, mixed numbers, 45/, f.o.b. shipping point.

Spiegeleisen.—The demand continues very fair and prices remain firm. English .20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—There has been a large business and prices show further improvement. Standard English sections quoted at £4, f.o.b. at N. W. England shipping point.

Steel Blooms.—Transactions are moderate, but prices remain firm. We quote £4. 2/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—There continues to be good demand and prices are very firm. Bessemer, 2½ x 2½ inch, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—Transactions in these are moderate, but mainly at firm prices. Bessemer, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—The demand moderate, but sellers firm at previous prices. Mild Steel No. 6 quoted at £5. 19/6 @ £6 and No. 5 at £5. 18/6, f.o.b. at N. W. England shipping point.

Scrap Iron.—A moderate business at previous prices. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Old Rails.—Demand very slow; rather more pressure to sell, and prices weaker. Tees quoted at £3. 2/6, and Double Heads £3. 5/, c.i.f. New York.

Crop Ends.—The market quiet and unchanged. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—A fair business passing, but prices somewhat irregular. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/3 @ 15/9
IC Bessemer steel, Coke finish.....	14/3 @ 14/6
IC Siemens.....	14/6 @ 14/9
IC Coke, B. V. grade.....	13/9 @ 14/
Charcoal Terne, Dean grade.....	12/ @ 12/6

Manufactured Iron.—The market still fairly active, with prices strong. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars.....	£ s. d. @ 8 2 6
" Common.....	@ 5 5 0
Staff. Bl'k Sheet, singles.....	@ 7 10 0
Welsh Bars (f.o.b. Wales)....	4 17 6 @ 5 0 0

Tin.—There has been a good business, and the market is strong, particularly for futures. Straits quoted at £102. 10/, spot, and £103 10/ for three months' futures.

Copper.—There is more doing at practically unchanged prices. Chili Bars, £78. 10/, spot, and £78, three months' futures. Best Selected, £81. 10/.

Lead.—The market declined under weight of American advices, but is now firmer. Soft Spanish, £13. 10/.

Spelter.—More business and the market hardening. Silesian, ordinary, £18. 17/6.

Coal.—Quite a tumble has taken place under pressing offers to sell cargoes just arrived, Newcastle declining to 28/ @ 30/ on the spot, and 35/ distant floats. Exchange, 90 days' sight, 26 $\frac{1}{2}$ d.—Weber & Co.

EAST INDIES.

SINGAPORE, September 5, 1888.—**Tin.**—Our last report was dated 23d ult.; prices have fluctuated since between \$34.50 and \$37.70, and a fair business has been done. Supplies are now arriving freely. **Tonnage.**—London rates via Canal are firmer at 30/ @ 32/6 for weight. New York via Canal, no space offering. Via Cape, the Gillemester has taken the berth at 25/ for weight. For Boston the John M. Clerk has been taken up on secret terms. Exchange is firm at 3/1 $\frac{1}{2}$ for six months' sight credits.—Giffman, Wood & Co.

MANILA, October 15, 1888.—**Hemp.**—Has been steady during the week at \$11.12 $\frac{1}{2}$, @ \$10.25 same time last year, $\frac{1}{2}$ picul,

equaling cost and freight $\frac{1}{2}$ ton, £37. 15/, @ £35. 17/6. There cleared for the United States since last cable 11,000 bales, against 7000; since January 1 163,000, against 178,000, and there remain loading 51,000, against 49,000; cleared for England since January 1 288,000 bales, against 175,000 last year; loading for ditto, 11,000, against 4000; cleared for all other countries, 59,000, against 33,000; receipts at all ports since last cable, 24,000, against 13,000, and since January 1, 506,000, against 404,000 in 1887, and 322,000 in 1886. Freight, \$6, against \$5.50; Exchange, 3/8 $\frac{1}{2}$, against 3/8.—Ker & Co. to Charles Nordhaus, 89 Water street, New York.

SPAIN.

BILBAO, October 6, 1888.—**Iron Ore.**—So far this year the export of Iron Ore from our port has decreased considerably, from 3,422,966 tons to 2,901,544; as at the same time freights by sea had risen very much, it would have been but logical that the price of our Ore should decline. Nothing of the kind has occurred, the fact being that the quality of our Ore is so valuable that neither a lull in the foreign demand nor high freights nor speculation have been able to depress their value. From now forward the scarcity of steamers will terminate; navigation in northern ports will close and many steamers will flock this way, as they usually do in winter, to load Iron ore at Bilbao, being the most profitable occupation in default of something better in other directions, which does not offer at present. What we have said refers to Rubios in particular, worth to-day 7/ @ 7/3. Campanil Ores are even better situated, and their position is stronger from the fact that there are but comparatively few mining companies owning mines producing Campanil Ores, and that this sort enjoys a special demand for Steel making of a superior kind. While there is every probability that Rubios Ore will rise in value with the resumption of greater activity in shipments, the chances are even greater in this respect as regards Campanil, now commanding 8/ @ 8/3. As for steam freights, they have declined a little in the Baltic, but they are higher in the Black Sea ports, where there is a good demand for steamers to load grain and tallow for England at 35/ @ 37/6 $\frac{1}{2}$ ton and to Bordeaux at 26/. Ore freights hence to Cardiff are 6/1 $\frac{1}{2}$ @ 6/3, and to Rotterdam, 8/ @ 8/3 $\frac{1}{2}$ ton; Pig Iron from Bilbao to Ancona in Italy, 15 francs $\frac{1}{2}$ ton.—Bilbao *Marítimo y Comercial*.

GERMANY.

HAMBURG, October 11, 1888.—**Petroleum.**—The tank steamers between the United States and Germany are causing a complete and most important transformation of the Petroleum trade. It was inaugurated by the firm of Riedemann at Geestemünde, near Bremerhafen, in 1885. Till 1885 the whole of Europe was in the habit of importing Petroleum in barrels from America only by sailing vessels, and the empty barrels were shipped back. In 1885 the firm of Riedemann caused one of their sailing vessels to be rebuilt, so as to be a "tank" ship, 72 Iron Tanks being fixed in the hold, filling the same, a cleverly contrived system of pipes connecting them mutually. Into these tanks the Standard Oil Company's Petroleum was pumped, and upon arrival at Geestemünde the contents were transferred to large reservoirs capable of holding 10,000 barrels. Riedemann thereupon caused the steamer Gluckauf to be constructed, the entire hold of which was a tank. Subsequently four additional steamers were built, the Vorwärts, Minister Maybach, Willkommen and Gut Heil. These five steamers have since been conveying annually 120,000 tons of Petroleum of 1000 kg. from the United States to Geestemünde, representing something like 830,000 barrels. The firm now own 15 large Petroleum reservoirs at Geestemünde. Part of the Petroleum is transferred to tank cars, of which the firm own 100, and besides quite a number of German and Swiss Petroleum dealers have caused to be built tank cars of their own, and the firm of Has, at Cassel, have a large reservoir. This trade has grown so much the last few years that at present nine-tenths of Bremen's entire Petroleum importation is received in tank ships, of which one-third goes direct into tank cars; the balance is filled into barrels at Geestemünde. In this item of filling barrels with Petroleum Riedemann also introduced innovations on a gigantic scale. At present he has a stock of empty barrels worth 1,265,000 marks; every day 4000 barrels are turned out. They have a bluish-white color, are lined with glue inside to resist Petroleum, and are filled by an automatic contrivance. The saving in space on board the steamers is such that a tank steamer takes 20,000 to 24,000 barrels of oil in bulk, whereas in barrels only 14,000 could be loaded. The loading of 24,000 barrels takes 60 hours, and the discharging 30 hours. While the leakage on the voyage is 3 to 4 % in barrels, there is none on board tank steamers.—Borsenhalle.

Weights of Engines and Boilers per Horse-Power.—In a paper entitled "The First Century of the Marine Engine," presented to the British Institution of Naval Architects, Prof. Henry Dyer refers to the reductions which have been made in recent years in the weights of engines and boilers, and supplies the following interesting table:

	Lbs. per I. H.-P.
Merchant steamers.....	490
Royal navy.....	860
Engines specially designed for light draft vessels.....	280
Modern locomotive.....	140
Torpedo vessels.....	60
Ordinary marine boilers, including water.....	196
Locomotive boilers, including water.....	60

No doubt these figures could be very much reduced if engineers endeavored to make their designs as light as possible; but here the commercial element limits their action, for light engines are always expensive, their high-class workmanship and costly material more than balancing the advantages to be derived from reduced weight.

From the Marquette (Mich.) *Mining Journal*, of the 13th inst., we take the following table, showing the shipments by ports up to date this season, in comparison with shipments for the corresponding portion of the two preceding years:

Port	1888.	1887.	1886.
Marquette.....	669,477	697,025	725,942
Escanaba.....	1,699,611	1,741,042	1,250,717
St. Ignace.....	97,090	80,654	62,595
Ashland, Wis..	880,268	930,316	612,968
Two Harbors, Minn.....	327,439	330,464	264,584
Total.....	3,673,885	3,779,501	2,916,581

The new port of Yaquina, in Oregon, where a breakwater and other improvements are making by the general Government, is represented as being the finest harbor on the Pacific Coast north of San Francisco. Portland is 110 miles from the ocean and Tacoma and Seattle, the ports of shipment of the Northern Pacific Railroad, have to traverse Puget Sound and the Straits about 180 miles before the ship arrives at the ocean, while it takes only a few minutes to cross the bar at the mouth of Yaquina Bay, when the ocean is reached and the ship is at sea. The appropriation made by Congress this year, it is said, will render this great harbor safe at all seasons, as the water on the bar at low tide at the present time is almost sufficient for vessels of the largest size. Arrangements are now in contemplation for the shipment of grain direct to Europe by the Oregon Pacific Railroad from Yaquina Bay, and the future is so promising that already a large population is concentrated at that locality.

The new armory for the Eighth Regiment, N. G. S. N. Y., about to be erected, will be one of the most artistic and imposing structures of its kind in the city. It will cover a plot of ground on Park avenue 200 x 300 feet, and at each corner will stand a spacious round tower of the baronial style, 50 feet in diameter and 135 feet in height. The material used is brick, with sandstone trimmings. The main drill-room, 200 feet square, will be on the first floor, together with a large reception-room, a library and the quarters of the officers and the Quartermaster's Department. The ten company-rooms will be on the second floor, and the third will be devoted to a gymnasium, a kitchen and the janitor's apartments. Under the main drill-room will be a 200-foot rifle range. The building will probably be completed by next September. The estimated cost of ground and structure is \$660,000. The cornerstone was laid 19th inst. with imposing ceremonies.

Hardware.

As the end of the month approaches there is perhaps a slight falling off in the volume of business, but the general conditions continue as before, with a satisfactory trade and prices that are substantially unchanged. The prospect for a good business during the remainder of the season is generally acknowledged.

Barb Wire.

The demand continues rather moderate and prices have not strengthened, remaining about where they have been. Carload lots of Four-Point Galvanized are quoted at about 3.60 cents, with slight concessions in special cases, and the usual advances for small lots.

Cut Nails.

The New York market remains quiet, without any recovery as yet from the low figures which have prevailed so long. We quote \$1.80 to \$1.90 for carload lots of Iron Nails from dock, and \$1.90 to \$2 for small lots from store.

It is reported that some Western makers are naming low figures throughout the territory tributary to this market, and in the East generally, with the object of forcing some understanding among manufacturers by a short, sharp and decisive war.

The unsatisfactory condition of the Western Cut Nail trade has caused one of the largest Nail companies in the country to shut down more than half of their Nail machines, for the first time in their history. They expect to keep them idle throughout the winter. A continuation of present unremunerative prices will probably cause a very decided curtailment in production by other companies, without regard to the action of their competitors in trade.

The Laughlin Nail Company call the attention of the trade to their 3d fine Polished Nails. They are made from plate that has not been pickled, and consequently will not make lathers' mouths sore.

Miscellaneous Prices.

The following are the list prices of McGuire's Star Thimbles, Registers and Ceiling and Register Plates, manufactured by E. C. Stearns & Co., Syracuse, N. Y. The list as given is subject to a discount of 60 per cent.:

McGuire's Star Thimble.

5-inch, 4 to 8 inch extension, per dozen.	\$10.00
5-inch, 6 to 12 " " " "	11.00
6-inch, 4 to 8 " " " "	11.00
6-inch, 6 to 12 " " " "	12.00
7-inch, 4 to 8 " " " "	13.00
7-inch, 6 to 12 " " " "	14.00

McGuire's Star Register.

6-inch, 4 to 8 inch extension, per dozen.	\$22.75
6-inch, 6 to 12 " " " "	23.75
7-inch, 4 to 8 " " " "	25.75
7-inch, 6 to 12 " " " "	26.75

Ceiling Plate.

5-inch, per dozen Plates.	\$2.35
6-inch, " " " "	2.75
7-inch, " " " "	3.25

Register Plate.

6-inch, per dozen Plates.	\$9.00
7-inch, " " " "	9.50

We are advised by the New Haven Copper Company, New Haven, Conn., for whom John H. Graham & Co., are agents, 113 Chambers street, New York, that they are holding their Augers and Bits at higher prices than heretofore, and are giving special attention to the quality of the goods, upon which they are relying to secure the orders of the trade.

From St. Louis our advices are that there is considerable improvement to be noted in the Wire trade, country orders coming in more freely and mills being

gradually worked up to their capacity. The demand for the cheaper grades of Wire is not, however, at the present time very large. The Freeman Wire Company, St. Louis, quote as follows:

Barb, Two and Four Point, Painted,	\$2.95 to \$3.10
Barb, Two and Four Point, Galvanized,	60 to 75 cents advance.
Nos. 6 to 9, Annealed.	2.35 to 2.40
Nos. 10 to 11, " "	2.45 to 2.50
No. 12, " "	2.55 to 2.60
No. 13, " "	2.70 to 2.75
Galvanized, 60 cents advance.	
No. 14	2.85 to 2.90
No. 15	3.15 to 3.20
No. 16	3.25 to 3.30
Galvanized, 75 cents advance.	

The Solitaire Coffee Urn, manufactured by the Chas. F. Henis Company, Philadelphia, Pa., for whom Samuel A. Haines, 90 Chambers street, New York, is agent, is quoted to the general trade at \$2.50 per dozen.

Owing to the present condition of the Lead market Solder is unsettled, and there is some diversity in the quotations made by leading manufacturers, No. 1 being quoted at from 12 to 13 cents, and Half-and-Half from 13½ to 14½ cents. The market is characterized by a rather weak tone.

The trade will observe the illustrations, given on page 646, of the Arcade Revolving Bench Plate, which is patented and put on the market by Frank E. Thompson, Elkhart, Ind. The utility of this device for holding Tinners' and Metal-Workers' Tools, Stakes, &c., will be at once perceived. A circular is issued by Mr. Thompson in which a full description is given of the article, and among other points which are mentioned is that twice the number of men can work at a bench with such a Bench Plate than at one without it. The Bench Plate is sold at \$2.50, f.o.b. cars Elkhart, no charge for box or cartage. Its shipping weight is 40 pounds.

The following quotations are made by the Nickel Plate Stove Polish Company, Chicago, Ill.:

Black Eagle Benzine Paste, 5 and 10 lb. cans.	12¼¢
Black Jack Water Paste, 5 and 10 lb. cans.	12½¢
Nickel Plate Paste, ¼ and ½ gross boxes,	
per gross	\$4.00

In Machine Bolts, in which there has of late been a good deal of irregularity, a somewhat better condition is said to prevail, prices being a little stiffer.

The combination on Common Carriage Bolts continues to work quite satisfactorily, but there are some indications of slight irregularities, in which, in a covert way, some of its provisions are evaded.

The market on Steel Goods is in a very satisfactory condition, and orders are being freely placed by the jobbers. The confidence that exists in the stability of the arrangement, and the fact that stocks were very much depleted at the close of the last season, have the result of making these orders liberal, covering large quantities.

The Screw market continues without change, and the combination prices are well maintained by the associated manufacturers. The Charles Parker Company, who are outside, are making small concessions in price.

No change in Manila Rope has yet been announced, but the condition of the market is such as to give reason to expect that an advance may be made before long. Sisal also is reported as decidedly firm.

As a consequence of the condition of the Lead market, Shot, Sheet Lead, &c., are in an unsettled state, and prices lately ruling are nominal.

E. M. Richardson, Waltham, Mass., is now putting up Shedd's Fast in paper

boxes containing 10 sets, with 100 to 500 sets in a case. No change has been made in the price.

Trade Topics.

From California we have received the following complaint in regard to Plumbs and Levels. It is to be hoped that the experience to which our correspondent refers is exceptional and does not indicate the general quality of the goods in question:

If you have any room in your valuable paper you will confer a favor on the trade generally by drawing the attention of manufacturers of Levels to an injustice they do retail dealers by sending out goods that are not correct. A few days ago a buyer came in to purchase a Level. We showed him samples and he chose one which we sell for \$3.25. Of course when a man pays that price he wants to see if it is accurate, and on going over 18 of this quality we did not find one that was correct as a Level, to say nothing of the Plumb, and, of course, we did not make a sale. The next day we started one of the clerks to go over the whole stock, and in 117 Levels we found the following result:

Correct in Level and Plumb.	0
Plumbs correct.	7
Levels correct.	3

We tried Levels that cost from \$4 to \$30 per dozen. We think manufacturers ought to be able to make the tools correct, and no doubt they would if a few retailers would kick.

A few manufacturers are issuing both net prices and quotations by list and discount. We are advised by one of these, a well-known manufacturing concern of the West, that some merchants prefer net prices on account of the convenience in not having to figure the discount, thus saving work in marking goods. Most of the trade, especially among the larger buyers, prefer the list and discount, as this method is much simpler and easier in purchasing the goods.

Items.

The Goulds Mfg. Company, Seneca Falls, N. Y., and 60 Barclay street, New York, have issued a new catalogue of their varied line of Pumps, Engines, Rams and Hydraulic Machinery. It is a volume of nearly 300 pages, compactly arranged, fully illustrated, and of unique typographical design. The front cover is represented in miniature in their advertisement on page 36. An interesting feature of the book, the utility of which will be appreciated by intending purchasers, is the many excellent illustrations of their goods in operation. An interesting department of the book is that devoted to a description of the manufacturing of their goods, and many illustrations are given representing the different departments of their factory and the various stages in the production of the goods. In addition to their line, with which the trade is familiar, a number of new goods are represented.

The F. B. Harkins Foundry Company, Bristol, Conn., manufacturers of a line of Cooking Ranges of several sizes, are also making a line of Stove Hollow-Ware and fine Gray Iron Castings, which are referred to as excelling in their smoothness of finish, special reference being made to their Unground Spiders. Mr. Harkins, the president of the company, has invented and secured patents upon a Molding Machine which may be used for the production of small work of various kinds, but is especially adapted for use in making Sash Weights. The Weights are referred to as in regularity and smoothness of surface superior to others in the market, and are sold at about the same price.

H. H. & C. L. Munger, manufacturers' agents for Hardware specialties, at 142 Lake street, Chicago, have been appointed Western agents for the Brinkhoff Company's Crown Picture-Hanger, which was illustrated in our columns on the 4th inst. They will carry a full stock, so as to be

able to make prompt shipments. They have also recently received samples of Lawson's Patent Revolving Shelf Showcase, for which they are sales agents. A new addition to their stock is a line of the Phoenix Bench Anvils, made by the Moore & Barnes Mfg. Company, for amateurs, jewelers, &c. They state that they are again well supplied with the Patent Fiber Head Mallets, the manufacture of which had been curtailed by the burning of the factory. These mallets have vulcanized fiber heads, pressed on under 200 tons pressure, which have been found equal to leather heads for mechanical purposes, and superior to them in durability.

It will be observed on page 59 that the E. C. Meacham Arms Company, St. Louis, Mo., call attention to some new Guns, somewhat shopworn, which they are offering at special prices.

The Hartman Mfg. Company, Beaver Falls, Pa., have established a Western sales agency in the First National Bank Building, Chicago, under charge of S. T. Hastie, for the sale of their Steel Picket Fence. They make both ornamental fences for lawns and field fences for farm purposes. It is not a netting, but a substantial fence.

A. G. Newman, successor to Newman & Capron, 1180 Broadway, with factory at 157 to 163 West Twenty-ninth street, New York, has issued a very fine illustrated catalogue of Builders' Hardware, including Locks, Knobs, Sash Fasteners, Handles, Bolts, Hooks, Hinges, Sheaves, Electric Bell Material, &c., all of which are represented in an attractive style, many tasty patterns being displayed. In their introductory address to their patrons they refer to the fact that the standard of artistic Hardware has been raised by the efforts of the architect and persons of taste, who have demanded of the Hardware manufacturer that the articles produced shall be in the highest style of the art, and it is to meet the demand for goods of this kind that the line represented in the catalogue is offered. The styles of finish applied to the goods shown in the volume are polished, light bronzed, light statuary, statuary or dark bronze, verde-antique, oxidized silver and gold-plated. This volume will be of especial value to architects and builders, for whom it is particularly designed.

The Freeport Hardware Mfg. Company, of Freeport, Ill., moved into their new office and warehouse last week. When the improvements now under way are completed they will occupy a space 88 by 150 feet. About half of this tract is now covered with a frame building, which is three stories high in front and two stories in the rear, running back to the railroad tracks for the purpose of securing good shipping facilities. The front part of the remainder of the tract is covered with the office building, and the rear will soon be occupied by another building which is under construction. The company manufacture a line of Hardware specialties, embracing the Wiles Spring Hinge, the Devore Spring Hinge, the Imperial Spring Hinge, the Warner Spring Hinge, Devore's Door Spring, Devore's Indestructible Awl, Linsley's Hobson's Choice Screw-Driver, the Wonder Cork Extractor, and Linsley's Box Opener or Nail Puller. They do not operate a foundry, but have their castings made by other establishments, and employ a force of workmen to put the various parts together. They have issued a neat catalogue of their specialties, illustrating and describing them, and setting forth their special merits.

The Eastern Tinware Company, Portland, Conn., announce that they have purchased the plant of the United States Stamping Company, at Portland, Conn., where they will continue the manufacture

of the goods. They have given Joseph Scheider & Co., 103 to 109 North Third street, Brooklyn, E. D., N. Y., the exclusive agency for their entire production. Referring to the above Joseph Scheider & Co. allude to the extensive line of goods which they manufacture in Brooklyn, together with the production of the Eastern Tinware Company, as enabling them to supply the trade with a full line of Tinware.

Seymour Mfg. Company, St. Louis, Mo., have issued a tasty catalogue of their Grain Cradles, Scythe Snaths and Spokes, 1888-89. The pamphlet is printed on superior paper and excellent illustrations are given of the different goods.

A sale of Hardware, on account of fire underwriters, takes place on the 24th inst. at 200 to 206 Madison street, Chicago. The goods are the salvage of Cutler, Woodrough & Co., 19 Lake street, and consist of 600 cases of Lock, Knobs, Latches, Casters, &c., and 200 cases of the Pioneer Lock Company's Hinges, Pins, Joints, Flat Irons, &c. They were slightly damaged by water in extinguishing a fire on the adjoining premises.

The Rogers & Hamilton Company, Waterbury, Conn., issue pages describing new patterns of goods which they are putting upon the market in tasty satin-lined boxes or cases especially designed for the fall trade. One of these refers to their Normandie pattern in old silver and illustrates a Pie Knife. An earlier issue shows their No. 133 Combination Set.

The Coleman Hardware Company, 55 Dearborn street, Chicago, and Morris, Ill., have issued a price list showing their Hardware specialties. It represents the Nickel Hangers and Rail, the J. G. C. Hanger, Nickel Spring Hinge, J. G. C. Spring Hinge, Nickel Stay Roller, Nickel Farm Gate and Shumard Sash Balance.

Joshua Britton & Son, Stoughton, Mass., have made a decided improvement in their Henry's Patent Combination Haft, of which they are manufacturers, and which they are now putting more prominently on the market. This Tool Holder, which is illustrated in their advertisement on page 58, carries the tools in the end of the holder in which they are used, so that when the tool is opened all the tools contained in it are in view with their points up, thus facilitating greatly the selection of the one wanted. The principal improvement which has been made is in the cap or sleeve, which is now made of brass nickel plated, instead of hard rubber, as heretofore. The tool is thus rendered much more durable, while at the same time it is given a handsomer appearance. The handle is made of rosewood. Other points made in regard to it are: That the same motion that unscrews the instrument removes the cap that covers the surplus tools; that no wrench is required and that the tool has a solid handle and can be used with a mallet.

C. & W. McClean, St. Louis, Mo., have issued their No. 700 illustrated catalogue, which contains nearly 100 pages, which are devoted to an exhibition of their line of Fishing Nets and Tackle, Guns, Sporting Implements, &c. An interesting line of Nets, which are not usually found in such publications, is given a prominent place, while Fish Hooks, Rods in large variety, Rod Fittings, Reels, Spoons, &c., are fully represented, with many specialties in this line. Traps, Guns, Gun Implements and miscellaneous Sporting Goods are also illustrated. The catalogue closes with a complete index.

Hibbard, Spencer, Bartlett & Co., Chicago, Ill., have issued, October 12, a 40-page catalogue of seasonal and staple goods. Skates, Sleigh Bells, Hand Sleighs and Snow Shovels are given a

prominent place, with a variety of other goods, including an extensive line of Clocks.

W. C. Burkinshaw has opened an office at 83 John street, New York, in which he will conduct the business of commission merchant and importer of Hardware. He has made arrangements with James Deakin & Sons, Sheffield, England, for the sole agency of their goods in the United States, and is prepared to execute orders for Ivory and Celluloid Table Cutlery, Stag Carvers, Pearl Dessert Knives, &c. In addition to the above Mr. Burkinshaw is prepared to receive orders for the exportation of American goods, and offers for sale here a line of fancy articles suitable for the jewelry and notion business.

A copy of the Colorado *Exchange Journal* for October 6 has reached us. It contains a great variety of matter, historical, biographical and industrial, relating to the City of Pueblo, accompanied with profuse illustrations. Among the engravings are a portrait of Guy T. Nash and a view of the building of the Pueblo Hardware Company, of which he is secretary and treasurer. From the biographical sketch in connection with the portrait we learn that Mr. Nash was born in Vermont in 1842, was a member of the Twelfth Vermont Regiment during the war, migrated to Iowa in 1870, went into the Hardware business at Fort Dodge and subsequently at Humboldt, and removed to Pueblo in 1885. The Pueblo Hardware Company are stated to be greatly increasing their business under his management, and their field enlarges as the territory tributary to Pueblo is widened by the rapid extension of railroad facilities.

The Miller Lock Company, Philadelphia, Pa., have issued their catalogue No. 8, which is devoted to an exhibition of their line of Champion Locks, of which full descriptions and illustrations are given. The extent of the line of Keyless Locks and the advances the company are making in this direction are to be noticed. They advise us that during the season just past the Young Men's Christian Association in this city secured an outfit of these Locks for its gymnasium lockers, and that other important orders are in hand, with a growing demand both home and export.

The American Machine Company, Philadelphia, Pa., for whom John H. Graham & Co., 118 Chambers street, New York, are agents, have issued a neat descriptive catalogue of the Crown Meat Cutter, of which we gave an illustrated description a few weeks ago. The catalogue explains the construction and operation of the machine, and gives testimonials in regard to its use, and a number of recipes for dishes, in the preparation of which it may be used. They also send out a unique and effective colored lithographic advertising card, which is utilized in calling attention to the machine.

Buhl, Sons & Co., Detroit, Mich., announce that they have admitted Charles H. Jacobs as a member of their firm, dating from August 1, 1888.

McIntosh, Huntington & Co., Cleveland, Ohio, have issued their winter circular of seasonable goods and specialties. It relates to Skates, Children's Sleighs, Toy Banks, Carvers, Registers, Foot Warmers, Lanterns, Snow Shovels, &c.

The Detroit Copper and Brass Rolling Mills, Detroit, Mich., of which C. H. Buhl is president, R. W. Gillet, vice-president, and L. H. Jones, secretary, have issued a convenient price list of their manufactures, in which pains have been taken to make the typographical arrangement such as to facilitate its use. They call attention to the completion of their new factory and their facilities for filling orders promptly.

In an article in regard to protection against polluted water, a recent issue of the *Sanitarian*, referring to the importance of Filters and alluding to some of the methods on which they have been constructed, says:

Porous stone, both natural and artificial, of various degrees of texture, has been extensively used in recent years, and with greatly improved results. Of such, in particular, is the Gate City Stone Filter, which uses a natural stone. It is put up in several varieties—china, glass and stone—and we are satisfied, from personal observation, that it comprehends the best requirements. Professor J. J. Browne, of Syracuse University, Syracuse, N. Y., after using one continuously in his laboratory for several months, writes: "I have thoroughly tested it. The foulest water I could obtain was first passed through the filter, and afterward examined with the microscope at intervals for a number of days without detecting the least trace of animalcule. Its decolorizing power is easily shown by filtering ink, iodide of starch, iodide of mercury, &c. I think that many who have witnessed these experiments are convinced that it has no equal. The ease with which it is cleansed (so obvious to all) is superior to every Filter of which I have any knowledge."

The Filter referred to will be recognized as that of the Gate City Stone Filter Company, 46 Murray street, New York, who manufacture, it will be remembered, a large variety of patterns, in most of which the ice used for cooling the water is kept in a separate chamber, thus preventing any contamination from that source.

The Pony Hand Elevator.

In connection with the description of the elevator which was given in our last issue, our attention has been called to the Humphrey Pony Hand Elevator, manufactured by the Edward Storm Spring Company, Poughkeepsie, N. Y., for whom John H. Graham & Co., 113 Chambers street, New York, are agents. The need of such an elevator as was described in our last issue led to the putting of the Pony Hand Elevator on the market, and it is regarded as meeting the needs of the trade and giving an elevator with a capacity of 500 pounds at a moderate expense. In the advertisement of the company on page 85 an illustration is given showing its arrangement, and its comparative inexpensiveness is evident when it is remembered that the price of the fixtures is \$36 per set, with a discount to the trade of 15 per cent. We are also advised that, when desired, the company will furnish the fixtures, fastened to a 1½-inch shelf, to fit exactly the top of well hole, at an extra cost of from \$2.50 to \$4, net, according to size. In such case, it is necessary for purchasers to give the size of the well hole, inside measurement. In connection with their catalogue, giving full description of this machine, the company send out a number of certificates from parties who have used them, and among them are several Hardware houses.

Tendencies in Trade.

We have received a number of letters from Hardware houses in different parts of the country with reference to the position of the wholesale houses and the question as to whether or not their business is being undermined on account of an increase in direct dealings between the manufacturers and the smaller trade. Referring to this matter a well-informed Hardwareman of Colorado writes as follows:

The last two years have shown the manufacturer and consumer getting nearer all the time. Any one acquainted with New York and Chicago, and visiting both places, cannot have failed to notice that the signs on Lake street, Chicago, are duplicating each year more and more the manufacturers' signs on Chambers street, New York. From simple agencies in Chicago, taking orders to be filled from

factory, stocks are now carried in Chicago by manufacturers, and, what is more, we can buy many goods from manufacturers as cheaply in Chicago as in New York. The jobber seems to be going West, and to-day the Missouri River jobbers are selling many goods as cheaply as those in Chicago and St. Louis. To us these things all appear to be straws, showing the way of the wind. I do not doubt, however, that the jobbing business is on the increase, because population is increasing, but I do not think it is in the same proportion.

We have also received the following careful review of the situation from a prominent Hardware merchant in Iowa, whose views in regard to the tendencies of trade are entitled to careful attention:

Our experience is that the great majority of Hardware retailers buy from the jobbers and not from the manufacturers. A few of the largest retailers probably buy East from certain manufacturers, or manufacturers and jobbers combined, who make it a point to solicit the business of this class of trade. The history of the jobbing Hardware trade from New York City west points to the fact that a jobbing center is a necessity every 200 miles at least. Notwithstanding the heroic efforts made by Chicago and St. Louis jobbers to corral the entire trade west of them, these smaller jobbing centers every 200 miles or less have continued to grow, flourish and increase. Retail Hardware dealers do not carry nowadays anywhere near the stock they formerly did when forced to buy from distant markets. This decided advantage is appreciated and accepted now as a necessity by the trade generally. Hence the establishment of supply-houses at convenient distances. Owing to the rapid increase and importance of jobbing centers throughout the more populous portions of the West, we find that jobbers located in the two largest Western centers have been forced to seek for trade in the extreme West, and to-day their heaviest trade comes from these sections, where no convenient supply-houses have as yet been established. To still further increase their sales new and varied lines of goods, foreign to Hardware, have been added to their stocks. This would not have been necessary had not their sales of Hardware been curtailed to a serious extent by the numerous jobbing centers that have sprung up and monopolized trade formerly purchasing their supplies from the two cities referred to.

It is not unreasonable to believe that the history of the jobbing Hardware trade of New York City will repeat itself as far as Chicago is concerned. We regard it as simply the natural course of events. Already a large number of prominent manufacturers are represented in Chicago, many of them carrying a full stock of goods there. When this becomes general we predict that the business of the West (as far as jobbing Hardware is concerned) will be done by the manufacturers' branch houses in Chicago, mainly through, and by means of, these jobbing centers scattered throughout the country at convenient distances. At present there is a severe fight for trade, and, possibly, existence. We think the remedy is with the manufacturers, who seem to be slow in appreciating the situation.

A house in Ohio compares as follows their experience with that of F. B. Straub & Co., the table of whose purchases was published in our issue, 11th inst.:

Regarding the subject in question we are very strongly of the opinion that the Hardware merchant of this section at least is buying his goods more generally from manufacturers (or their agents) than

from jobbers, and that the effort of the retail Hardwareman is now, as it has been for years past, to get nearer the manufacturer in his dealings. Our own experience has been that in the years from 1870 to 1875 nearly 75 per cent. of our purchases were from jobbers, two-thirds of whom were Western, of our own locality. Since that period our purchases from jobbers have gradually declined and those from manufacturers proportionately increased, until in the last five years the average percentages have nearly reversed. As between Western and Eastern manufacturers, our purchases are gradually working in favor of Western.

From a wholesale house in Minnesota we have the following review of the situation:

We have noticed the article in *The Iron Age* of Fred. P. Straub & Co., to which you refer, and, while in our own experience we have not the matter so accurately tabulated as the above firm, yet we have observed a tendency in the direction indicated by their table. We think this arises, perhaps, more from the fact that manufacturers are soliciting the general trade more than formerly, rather than that the trade are looking after the manufacturers. Many small manufactories are being established over the country, and, usually, they introduce their goods by going to the general trade. The jobbing trade is also being distributed over the country, and not concentrated in New York, Chicago, St. Louis and other large cities, as formerly, in our opinion.

A well-known house in Michigan in the following letter refer especially to the importance of the jobber as a distributor to the retail trade:

Our experience is that, with proper manipulation, we are able to get fully as good terms and prices from Hardware jobbers as from manufacturers. Large manufacturers especially protect and favor jobbers to such an extent that we can get fully as favorable quotations from them as from the manufacturers, and, while this state of things continues, we feel inclined to give the jobber the preference. The jobbing institutions of the country are a necessity, and, with the majority of the retail dealers, cannot be dispensed with.

Referring to the general question a Hardwareman in Iowa writes as follows:

There exists to-day a tendency on the part of retailers through the West to buy of jobbers, for the reason that the jobbers will meet any prices quoted by the manufacturers. Again, the retailers are lightly stocked and find it convenient to assort up with large jobbing houses. My impression is that the big jobber has got the manufacturer by the throat and compels him to sell at his own offer, just as the bondholder has Uncle Sam by the throat and makes him come down handsomely.

A Kansas Hardwareman refers as follows to purchases from manufacturers and jobbers:

In my opinion there is a steady increase in trade between retail dealers and manufacturers where the retailer is so situated that he can pay spot cash and does enough business to warrant his buying in large quantities and original packages. Location has much to do with his trade, as a Western retailer can better afford to buy from a Western jobber than from an Eastern manufacturer on account of getting his goods quicker, while with Eastern retailers, I should judge, the most of their trade would be with manufacturers. A Western manufacturer who gave the retailer the benefit of the jobber's profit would, in my opinion, get the bulk of the Western trade, even on spot cash basis.

FIRST PRIZE LIST IN CIPHER COMPETITION.

The following is the list of ten-letter words which secured the first prize in this competition, the list being that submitted by C. F. Rood, of Grand Rapids, Mich.

Abjunctive	Clypeiform	Disgruntle	Felspathic	Graciously	Ideography	Logarithms
Abridgment	Coadjument	Disharmony	Fieldsport	Grainmoths	Inchoately	Longimetry
Absorptive	Coadjuting	Dispatcher	Fieldworks	Gramineous	Incompared	Longitudes
Assumption	Coadjutive	Disputable	Figurantes	Grandevity	Incubatory	Lovetricks

ADDITIONAL COMPETITIONS.

In the letters from our readers concerning this competition received during the weeks since its announcement, we have been favored with various suggestions of other competitions similar in character and object. We feel disposed to announce additional contests, but before doing so would like to hear further from our subscribers as to their ideas in the premises. Accordingly, we defer the matter for the time being, and trust all who have any ideas or suggestions on this subject will write us. What shall be the next contest? What subject will be of the greatest value to our readers? We want a large number of letters.

On Friday last the Scranton Steel Company, of Scranton, Pa., rolled 55 tons of 60-pound rails in one hour, the largest record thus far.

The Peoria Cordage Company, Peoria, Ill., have been organized with a capital stock of \$200,000, and are now putting up a factory 84 feet front by 150 feet deep, three stories high. It is expected that they will commence manufacturing binder twine about the 1st of February, and

will add rope machines at an early date. The company have additional ground upon which they can extend their business by enlargement of factory, and are also reported to have ample capital to carry on a successful business. Martin Kingman, of Kingman & Co., manufacturers of farm machinery, is president, and E. C. Heidrich, who has been connected with the Miamisburg Binder Twine Cordage Company for the past five years, and previous to that with John Bonte & Son, Cincin-

nati, Ohio, is vice-president, and will be the general superintendent of factory. Kingman & Co. are largely interested in this new concern, and it is expected that they will market extensively the product of the twine factory.

The Southern Railway and Steamship Association have issued a new rate sheet on pig iron, showing an advance of 20 cents a ton on the figures published in *The Iron Age* of September 27, page 458.

The Solitaire Coffee Urn.

We illustrate below this article which is manufactured by the Charles F. Henis Company, Philadelphia, Pa., for whom S. A. Haines is agent, 90 Chambers street, New York. It is represented as placed in the cup in the manner in which it is used. This simple and attractive article consists of a cylinder or urn about 4 inches deep and 2½ inches in diameter, with perforated bottom with a fine screen, and an encircling flange which rests on the top of the cup. The urn has, it will be observed, three projecting ribs which fit into openings in the encircling flange, permitting the urn to rest on the bottom of the cup. In this position the requisite quantity of boiling water is poured upon the coffee which is placed in the urn, which is permitted to remain in that position for a few minutes until the full strength of the coffee is extracted. The urn is then raised through the flange which remains stationary on the edge of the cup until the three

The Solitaire Coffee Urn.

projecting ribs are out of the notches, when slightly turning the urn it takes the position shown in the illustration. The urn is thus supported on a flange while the coffee percolates into the cup beneath. This article is neatly, and well made and finished in nickel plate. Attention is called by the manufacturers to the advantages of this simple contrivance as enabling one to have a cup of excellent coffee without the inconvenience that is attendant in making it in the usual way. The moderate price at which it is offered is a point deserving the attention of the trade, as is intended to be retailed at 25 cents.

The Rouser Burglar Alarm.

This article, which is illustrated in the cut given below, is manufactured by E. C. Ellwood, Green's Farms, Conn. It will be seen at a glance that this is a device for exploding a cartridge when the window or door to which it is applied is opened. The illustration represents it as attached to the right side of the window frame on the stop bead E, F being a portion of the sash. The hammer B is pivoted to the post A by a pin, as shown. The hammer when the alarm is set is held up by the stop C, which is screwed to the sash. When the hammer is raised to this position tension is put upon a coiled spring which encircles the pin above mentioned, and when the sash is raised a slight distance the stop C passes off the end of the

hammer B, and the spring carries down the hammer, the point of which strikes the head of the cartridge, as indicated in the dotted lines. The cartridges used in this alarm are Smith & Wesson's 32 calibre central fire blanks. It is pointed out that

cut; and the less the throw the shorter the cut. This box is referred to as cutting stalks with ease and rapidity, and is regarded as filling a long-felt want for a box that will handle corn stalks as well as straw with equal facility. The moderate

The Rouser Burglar Alarm.

the stop C may be so set that a very slight upward motion of the sash will free the hammer so that the alarm will operate before a burglar can pry up the lower sash enough to break a sash fastener. This device is also made in modified styles for application to doors, and it can also be readily attached to outside blinds. It is made in different styles of finish.

Richmond Champion Section Self-Feed Cutter.

The Wayne Works, Richmond, Ind., are making this machine, which is represented in the accompanying illustration, and its name indicates some of its special features. It is pointed out that the machine will cut

Richmond Champion Section Self-Feed Cutter.

any length the operator requires, and can be changed instantly by raising or lowering the stop on the left-hand side of the box, by merely slacking up the thumb-nut. This thumb-nut controls the greater or less throw of the feed rolls, and the greater the throw of the feed rolls the longer the

price at which it is furnished is also alluded to, as well as its large capacity, it having 11-inch throw. In case of breakage any part can readily be renewed.

Farrier's Tool-Box.

Wells Bros. & Co., Greenfield, Mass., are putting on the market the Little Giant Farrier's Tool-Box, a cut of which is herewith given. It is, as its name implies, a

Farrier's Tool Box.

box for horseshoers' tools, and is described as made of thoroughly seasoned stock, lock corner, mortised bottom, and side pieces finely finished and thoroughly made. It is stated that this case, properly used, will last a horseshoer much longer than those commonly in use. The moderate price at which it is offered is also alluded to.

The new steel steamship *Corona*, built by Neafie & Levy for the Oregon Navigation Company, made a successful trial trip on the Delaware, on Saturday. A peculiarity about the *Corona* is that her masts, spars and decks, as well as her hull, are entirely of steel. She is 235 feet long, 36 feet beam and 23½ feet depth of hold, with triple-expansion engines of 1350 horsepower, with cylinders 21, 30 and 50 inches diameter and 3-foot stroke.

The J. G. C. Spring Hinge.

This hinge has recently been put on the market by the Coleman Hardware Company, 55 Dearborn street, Chicago, and

constructed that it may easily be placed in position. This device obviates the necessity of having a large iron plate provided with a number of holes, and also of cutting holes in the edge of the bench. It is care-

men to handle them. The lift is about 1 foot per day and it then takes a day to reset the jacks. The cost is estimated at about \$40,000.

The J. G. C. Spring Hinge.

Morris, Ill. It is represented in the illustration herewith given, and has, it will be observed, two long springs arranged as shown in the cut, which are referred to as giving great elasticity and equalizing the tension. The simplicity of the hinge, the fact that it cannot come apart, that it is reversible and holds the door either open or closed, as desired, are points that are made in regard to it. It is put on the market with special claims for its merits as a light hinge, and the low price at which it is offered to the trade is also alluded to. Every pair is warranted satisfactory to the user, and samples will be sent to the dealer on application.

The Arcade Revolving Bench Plate.

An article which is said to be meeting with favor at the hands of metal workers, tinnerns, and others engaged in kindred trades, is a bench plate which has been placed on the market by F. E. Thompson, Elkhart, Ind. In the device which is here shown in general view the recently incorporated features are a square top instead of a round one and a more thoroughly braced underpiece. This bench plate is claimed by the makers to be adapted to receive any of the stakes, shears or other tools used in connection with bench work in the shops of tinnerns and sheet-metal workers. By its use tools can be turned in any position without being removed from it. Shears may be held at two angles, a feature which all the trade will appreciate. It is of comparatively small size, occupying a space 9 x 9 inches on the bench, and is so con-

fully made and very durable in all its parts.

The McCormick offices in Chicago are being jacked up 6 feet 5 inches to meet

Improved Revolving Bench Plate.

the changes in street gradients. The building is 100 x 125 feet, six stories high and weighs nearly 20,000 tons. Several thousand screw-jacks are required, and 300

men to handle them. The lift is about 1 foot per day and it then takes a day to reset the jacks. The cost is estimated at about \$40,000.

The Clipper Grinder No. 2.

The accompanying illustration represents this machine, which is made by the Higginum Mfg. Corporation, 189 and 191 Water street, New York. It is a small, neat and compact machine for sharpening small tools, knives, &c. It has a grinding wheel 6 inches in diameter, 1 1/4-inch face. It is called a free grit stone, and is made under an English patent. It is described as grinding a tool quickly without draw-

The Clipper Grinder No. 2.

ing the temper. It runs in a trough of water, and is geared to revolve four times to one turn of the crank.

The swaying of the Washington monument when moved by the wind, as well as the expansion caused by the sun on its eastern side, is accurately indicated by a steel wire and plumb bob, suspended from a point 174 feet above the earth. When the structure is at rest the plumb line exactly corresponds with vertical marks.

Contracts were given to English shipbuilders last week for the building of ten tank oil-carrying steamships for use between Europe and Philadelphia and New

York. The recent disasters to the tank steamships *Ville de Calais* and *Hafis*, it is said, will have no effect in preventing the building of tank vessels.

CURRENT HARDWARE PRICES.

OCTOBER 24, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

THE IRON AGE

THURSDAY, NOVEMBER 1, 1888.

The Dean Blowing Engine.

We show on this page elevations and sections of a direct-acting blowing engine built by the Dean Bros. Steam Pump Works, of Indianapolis, Ind. It was specially designed for agitating oils, acids and chemical preparations and has been

being run at a high speed. Ten sizes are made, with steam cylinders ranging from 4 to 12 inches in diameter and air cylinders from 5½ to 16 inches, the strokes varying from 7 to 18 inches. The engines are also claimed to make superior air pumps for condensing engines, working efficiently on either surface or jet con-

Locomotive Draft Appliances.

The possibility of making the exhaust steam from the locomotive perform the work of creating the necessary draft and yet pass out under pressure light enough to prevent obstruction to the piston during the return stroke is at present receiving a

Fig. 3.—Longitudinal Section.

DIRECT-ACTING BLOWING ENGINE, BUILT BY THE DEAN BROS. STEAM PUMP WORKS, INDIANAPOLIS, IND

extensively used in cotton-seed oil works, where it has given excellent satisfaction. The stroke is adjustable, permitting the running of the air piston close to the cylinder head, and the space around the valves is very small, thereby expelling the greatest quantity of air possible from the cylinder at each stroke. The lubrication of the air cylinder is secured by delivering the oil directly into the cylinder over the crank of piston. The engine is capable of

densers. Figs. 2 and 3 clearly show the principal features of the design.

Lately three cars came into the south yards, at Grand Rapids, Mich., bearing the official placard of the Custom House Department and consigned to the Gunn Hardware Company. These cars are the first that have arrived under such circumstances, and contain plate tin direct from the manufacturers, in Wales.

great deal of attention from railroad men. In a recent article on the subject the *National Car and Locomotive Builder* remarks:

The ordinary combination of low double nozzles, lift pipe in the smoke-box, large cylindrical smoke-stack and diamond spark arrester has had its day, and nearly all progressive men who are striving intelligently to reduce the consumption of coal have found a more economical means

of creating draft. To stimulate the fire by drawing the necessary air through the grates, a certain smoke-box vacuum is required. Experience with ejectors and injectors has convinced engineers familiar with physical investigations that velocity of steam has less to do with creating a good vacuum than the proper adjustment of the mechanical appliances employed. Those who have experimented with different draft appliances and had the means of showing accurately the effect of different combinations have also been led to the same conclusion. The ejector principle is undoubtedly the true and proper line to work on for creating draft with low steam velocity, and the hope of some investigators who are now working up this subject is to find a nozzle arrangement that will create the necessary vacuum in the smoke-box, yet tend to form a vacuum in the cylinders instead of back pressure. It would be difficult to conceive of a more irrational arrangement for creating draft on the ejector principle than two nozzles set side by side passing columns of steam into a chimney with which neither can be central. That the arrangement ever became popular is astonishing, and its general introduction was possible only through economy of fuel receiving a little attention, and from the fact that methods of measuring the relative wastefulness of different ways of maintaining draft received practically no attention. It was a very loose way of deciding on the merits of anything new applied to the engine, to ask the engineer how it worked. Many a good thing has been unjustly condemned, and many a worthless appliance temporarily prospered by such unbusiness-like methods.

The mechanical departments of several railroads are trying exhaust-pipes designed after the pattern used by Mr. F. W. Webb, London and Northwestern Railway. There has been no difficulty in making all the steam needed when this nozzle was in use, but most of those who have applied it have made their exhaust-pipe too small for boring out to the large size admissible with this means of fanning the fire. Mr. J. N. Barr, of the Chicago, Milwaukee and St. Paul, is experimenting with nozzles on the ejector form. He has got sectional drawings of the leading ejectors and injectors, and is trying draft appliances adjusted as nearly as possible according to the proportions that have worked so successfully in raising water and in expelling air. Mr. W. W. Sprague, general foreman of the Chicago, Rock Island and Pacific repair shops at Chicago, designed a single annular nozzle which has given remarkably good results. He passes the steam into a globular chamber which surrounds a pipe like a lift-pipe, and which performs the same functions. The steam passes out from the chamber by an annular nozzle 14 inches diameter surrounding the central pipe. The total area of the nozzle was equal to that of a round nozzle over 6 inches diameter, and it gave a higher smoke-box vacuum than the 3-inch double nozzles used on the road. Mr. F. C. Smith, Peoria, Decatur and Evansville, has also been working on an annular nozzle in combination with an improved form of exhaust-pipe, with which he hopes to effect a slight vacuum in the cylinder instead of the back pressure that exerts such a prejudicial influence on the working of many locomotives.

The Bergen, a screw ferry-boat built for the Hoboken Land and Improvement Company, and to run between New York City and Hoboken, was launched on Thursday, at Newburg, from the shipyard of Thomas Marvel & Co. She has a cast-steel propeller-wheel at each end, instead of the customary paddle-wheels. Each wheel is 8 feet in diameter, and the

two will be used whichever way the boat goes. We would repeat here that the boat will have triple-expansion engines built at the Delamater Iron Works, of New York, and will, accordingly, carry a very high steam pressure, never before tried on ferry-boats. It is of interest to note, also, that boats with propellers at each end have previously been used on the Detroit River, one having been built last year at St. Ignace, Mich.

Steel Rails in England and the United States.

J. Schoenhof, who is Consul at Tunstall, and who has obtained a good deal of notoriety through his efforts to show what is the cost of making iron, has added another contribution of the same kind. The Department of State has issued a special report, No. 49, which contains this document. As usual, it is an attempt, more or less successful, to guess at costs on the basis of partial or incomplete data. We quote from it the following:

In England the manufacture of steel rails has almost entirely been removed to the seashore. The transportation of the ores, as well as the transportation of the finished rails for export is, therefore, reduced to one carriage from the ocean steamers to the furnace and from the mill to the steamers, with but very little intervening additional expense. Large steel works situated in Sheffield, where I had expected to obtain information on the subject, had removed their rail mills to Workington on the west coast of England. Middlesboro' and neighborhood towns on the Tees are large producers of steel rails. Here the advantages for shipping and receiving are very great. The ocean steamers are wharfed alongside the works and the unloading and reloading on trucks are all the intermediate labor and expense required. The native ores for basic steel are not far distant. The Durham coal fields supply coke at a comparatively small transportation expense, according to the distance, from 2/ to 3/. The foreign ores are brought to the wharf close to the furnace, and so all advantages are made use of to save where alone savings are obtainable in the elimination of distance by judicious locating.

PIG IRON.

As to mining in the Cleveland district, the ore is of a soft nature and easily mined; it is of 31 to 32 per cent. Some of the mining is surface mining and other by shafts. A miner can mine easily 5 tons a day, working eight hours, for which he gets 10d. a ton. In very rich seams they mine as much as 6 to 7 tons. The employment is very regular, and 4/ a day is about the average for pretty nearly the whole year at the present time. The wages would be the same in bad times, too, only with the difference that the men would then have four or five days' work a week only. The differences in the labor cost in pig-iron making are caused principally by the quality of ore, the richer ores naturally requiring less wheeling, &c., to the ton of pig iron. The coke costs in Durham, put on cars, 8/, or \$1.94 per ton; transportation to Middlesboro' average two-sixths, or 60 cents per ton; total, \$2.54.

Cost of Cleveland Iron used for Basic Steel.

3 1/4 tons of ore at 4/ (96 cents).....	13/	\$3.14
1 1/4 tons of coke at 10/6 (\$2.55).....	11/6 6	2.80
3 1/2 ton of limestone at 3/6 (84 cents).....	2/0 4	.49
Labor.....	4/	.97
Wear and tear, repairing, stores, &c.....	2/	.48
Office expenses, &c.....	/6	.12
Total.....	33/1	\$8.00

Hematite Iron.

The iron is Spanish ore, of 50 per cent., brought from Bilbao. Cost, 7/; freight, 6/6; total 13/6, or \$3.28 per ton.

Cost of Iron for Bessemer Rails.

2 tons of Bilbao ore at 13/6.....	21.	7/	\$6.56
1 ton of coke at 10/6.....	10/6		2.55
2 1/2 ton of limestone at 3/6.....	1/4 6		.38
Labor.....	3/3		.79
Wear and tear, &c.....	2/		.48
Office expenses, &c.....	/6		.12
Total.....	22.	4/7 1/2	\$10.88

The four furnaces of the firm turned out in the week of November 12, 1887, which may serve as an average: Cleveland iron, 665 and 507 tons=1172 tons; and in two furnaces, hematite iron, 836 1/2 tons. Total, 2008 1/2 tons, at a cost in labor of £351. 19/2, or 3/6.1 per ton, equal to 85 cents. Of course it is not possible to exactly state the precise cost of labor of each species of iron made simultaneously in the different furnaces for which one general labor account is kept. The cost, as stated here, is pretty nearly the same as in other Middlesboro' furnaces. From the proprietor I have obtained a specified statement, a copy of the pay-roll of every laborer employed, and wages paid, which foot up as stated above. Other iron masters gave me the same cost, on inquiry. The statement of another firm is for four furnaces of 1674 tons only. Two of these turned out 744 tons, one 522 tons and one 408 tons. Ore, 3 1/4 tons in Cleveland iron, 2 tons in hematite iron; coke, 1 1/2 tons in Cleveland iron, 1 ton in hematite iron; coal for calcining, 1 1/2 ton; labor, 3/6, average; office expenses, rates, taxes, /9.

AMERICAN BLAST-FURNACE WORK.

The American furnaces are owned by the company manufacturing steel rails. They have eight furnaces, with an output per week of 3000 tons. The works are well managed and have all the modern improvements. The company makes the greater part of its own iron and uses about 30 per cent. of Cornwall iron in its output of steel rails. They use for their iron Cuban and European ore of 58 per cent. The quantities used per year are 60,000 tons from Cuba and 200,000 tons from Europe. The cost of ore per ton of pig iron is \$11, or, at 58 per cent., \$6.38 per ton at the furnace, against 2.90 of the same percentage of iron in the ore at Middlesboro'. Seventy-five cents duty added would still leave \$2.73 to be accounted for as covering the freight surplus charge from Bilbao or North Africa to Philadelphia over freight cost to Middlesboro', and the inland transportation from tide-water to the furnace, a distance of about 80 miles.

THE FUEL.

The fuel is three-fourths coke and one-fourth anthracite coal. The coke costs \$4.75 per ton, delivered at the works; the coal, \$2.85 per ton. The coke at Connellsville was then \$2 per ton, but at the later date of my visit in the coking region it had receded to \$1.75, put on board cars, and would, therefore, stand at \$4.50 delivered at the furnace. The difference would be in the transportation expense, which would seem rather a high rate. Coke, however, has been sold as low as 90 cents per ton at the ovens, and even at the present price is cheaper at the place of manufacture than at the ovens at Durham, where the English coke is obtained.

LABOR COST IN PIG IRON IN AMERICA (EASTERN PENNSYLVANIA).

The furnaces are worked by two shifts of 12 hours each. Each shift is composed of 16 men, or 32 men for the 24 hours on each furnace—in all 256 men for the eight furnaces, which is per man, at the 3000 tons weekly output, 11.72 tons. The boss men are paid from \$1.65 to \$1.75 per day, the furnace men \$1.30 per day, and ordinary laborers, &c., \$1.16 per day. The average of all employed is \$1.30 per day. The seven days at \$1.30 make \$9.10 per man. We have therefore to arrive at the cost of furnace work per ton by $256 \times \$9.10 = \$2,329.60$, which gives 77.65 cents as cov-

3,000

ering all furnace labor expense of making a ton of pig iron. The general labor cost was given me by the president as \$1.25, which leaves, therefore, a margin of 47.35 cents for all incidental and yard labor of handling ore, coke, coal and iron, unloading and loading, not included in the direct furnace work. The general expense is given me as 12 cents per ton; sundries, supplies, electric light, &c., as 50 cents per ton—in both instances about the same as in the English account. Taking the different items, then, we have the following positions in Bessemer pig iron in Eastern Pennsylvania, made of Spanish and Cuban ores, against English iron of the same class.

	Eastern Pennsylvania.	Middlesboro'.
Ore.....	\$11.00	\$6.56
Limestone.....	.40	.33
Fuel.....	4.50	2.55
Labor.....	1.25	.79
General expense.....	.12	.12
Sundries.....	.56	.48
Total.....	\$17.77	\$10.83

It will be seen that the only marked differences lie in the ore and fuel account, due to causes explained above.

COST OF MANUFACTURING BESSEMER STEEL RAILS IN ENGLAND.

The steel mill from which I have taken this account works in shifts of 12 hours. They make 40 charges per day, have two converters, and turn out 7 to 8 tons in each heat. The weekly output is 1500 tons, and the number of men employed is 600. The weekly pay-roll is £950. The average cost of labor per ton is therefore 12/8, or \$3.07 per ton. The several items in this sum stand as follows:

	s. d.	
Labor in converting.....	3 6	\$0.85
Labor in rail-making from the ingots.....	8 0	1.94
Additional labor.....	1 0	.24
Total.....	12 6	\$3.03

The cost of pig iron is taken as 45/ per ton; spiegeleisen, 80/ per ton.

	s. d.	
It takes 11-10 tons of hematite iron at 45/.....	49 6	\$12.38
It takes 1½ cwt. of spiegeleisen iron at 4/.....	6 0	1.44
It takes 14 cwt. of coal at 7/6 per ton.....	5 3	1.28
Labor.....	12 8	3.07
Total.....	73 5	\$18.15

The present price of steel rails is £3. 17/6. This leaves no margin for profit, and barely enough to cover the charges. asking whether the 4/1 between the selling price and cost price could not be considered in the light of a profit, I was answered: "Should we make the sum of 4/1 profit we should be pleased. It is a long time since railmakers could see a certainty of 4/ per ton." It must be understood that this is about the lowest price steel rails have ever reached in England, and it is the general expression that it is hard work now to get a new dollar for an old one. That the price is not a paying one can be seen from the favorable consideration which is given by English manufacturers to the proposal of German rail manufacturers to revive the old steel-rail combination, which has in view the raising of the price and the parceling out of the output and the trade between the English, German and Belgium manufacturers. The wages are, for fitters, turners, roll-turners and bricklayers, 5/6, or \$1.34 per day; for smiths, enginemen and joiners, 5/, or \$1.22 per day; for men at rolls and furnaces, average 7/, or \$1.70 per day, and for outside men, 4/, or 97 cents.

COST OF BASIC STEEL RAILS.

The mill is one which, in the opinion of ironmasters, is supplied with the best improvements, and equal to the best American mills in labor-saving arrangements, &c. I cannot say that in going over it I came to a like conclusion. I find the American rail mills which I have seen far ahead in improvement and the introduc-

tion of labor-saving devices over any at least that have come within the scope of my present observation in England. On the whole, it is conceded willingly by English makers that America surpasses them in the output and improved methods of manufacture. The iron used in this steel is Cleveland pig, but the cheaper price per ton is balanced by the greater amount of iron required for a ton of rails. About 800 men are employed, who draw in weekly wages (the week for which the account stands) £1294. 1/6, or \$6278, equal to \$7.84 per day, or per ton, 10/9½, or \$2.62. The account is as follows:

	s. d.	
1,3110 tons of pig iron at 33/4.....	43 8½	\$10.62
.1410 tons of ferromanganese (spiegeleisen) and hematite.....	9 10½	2.40
Fuel.....	5 4	1.30
Labor (converting, 4/4; rail-making, 5/11).....	10 3	2.49
Additional.....	8 10½	2.16
Total.....	78 0	\$18.97

The additional are given me as being in reality 9/9, or \$2.37, in excess of the other account. Labor items like brick-laying, &c., contained in the labor account of the hematite rail mill are here contained in the additional, the difference between 10/3 and 10/9½, or 6½d. = 13 cents. The greater part of this sum, 9/9½, however, is offset by the credit deduction for value of ends and defectives. The "additional" are higher in basic than in Bessemer steel. In this sum, royalty, lime, limestone, tar, refractories, castings and sundry stores and purchases for maintenance are contained.

THE AMERICAN COST OF MAKING BESSEMER STEEL RAILS.

The time when this inquiry was made in America was in 1887, a year of high prices. Steel rails had sold during the year at prices ranging from \$40 to \$32—during the greater part of the year being very close to the former sum named. At the time of my visit, in December, they were about the last named price. During the year wages were raised twice, each time 10 per cent. Whether these advances are still in force, I cannot tell. It is very doubtful, however, in view of the fact that steel rails are quoted now at \$28.50 f.o.b., to \$29, which is barely \$10 above the English price—a price likely to be advanced at a very early day as being unremunerative to the makers.

The weekly output is 4500 tons. The mill has four converters, but only three working. The men at the converters work in three shifts of 8 hours each, the rail-making employees two shifts at 12 hours each. In all, 1048 men are employed in the steel works. The pay-roll for the month was about \$57,000. This is \$54.38 per man per month, and at 25 working days, \$2.17½ per day and \$13.05 per week—about two-thirds more than the average English wages in steel mills. If we divide the amount of money paid for labor over the output, however, we shall find no such difference to exist, as these higher earnings might leave people to suppose. The weekly wages of the month of fairly even distribution of work over each week and steady employment of the men stand as \$13,680, and the output of 4500 tons gives us labor cost per ton thereof \$3.04 of all moneys paid out on this heading.

Salaries and expenses were stated at 50 cents per ton. On an output of 225,000 tons, \$112,000 for years of equally full output. The general labor cost was stated to me as \$3.85 per ton. I cannot well understand what items these additional 84 cents would comprise, as the outlays for wages of \$56,000 to \$58,000, I was told, cover all labor employed at the steel works. I give this as received and leave closer analysis to a future re-examination of the details. The different items of cost

are composed of the following factors as given from the mill account:

Items of Cost in 1 Ton of Steel Rails in Eastern Pennsylvania.	
1 ton of pig iron.....	\$18.00
3 cwt. spiegeleisen.....	4.00
Fuel.....	2.00
Labor.....	3.04
Sundries.....	.50
Additional labor (unexplained).....	.84
Total.....	\$28.38

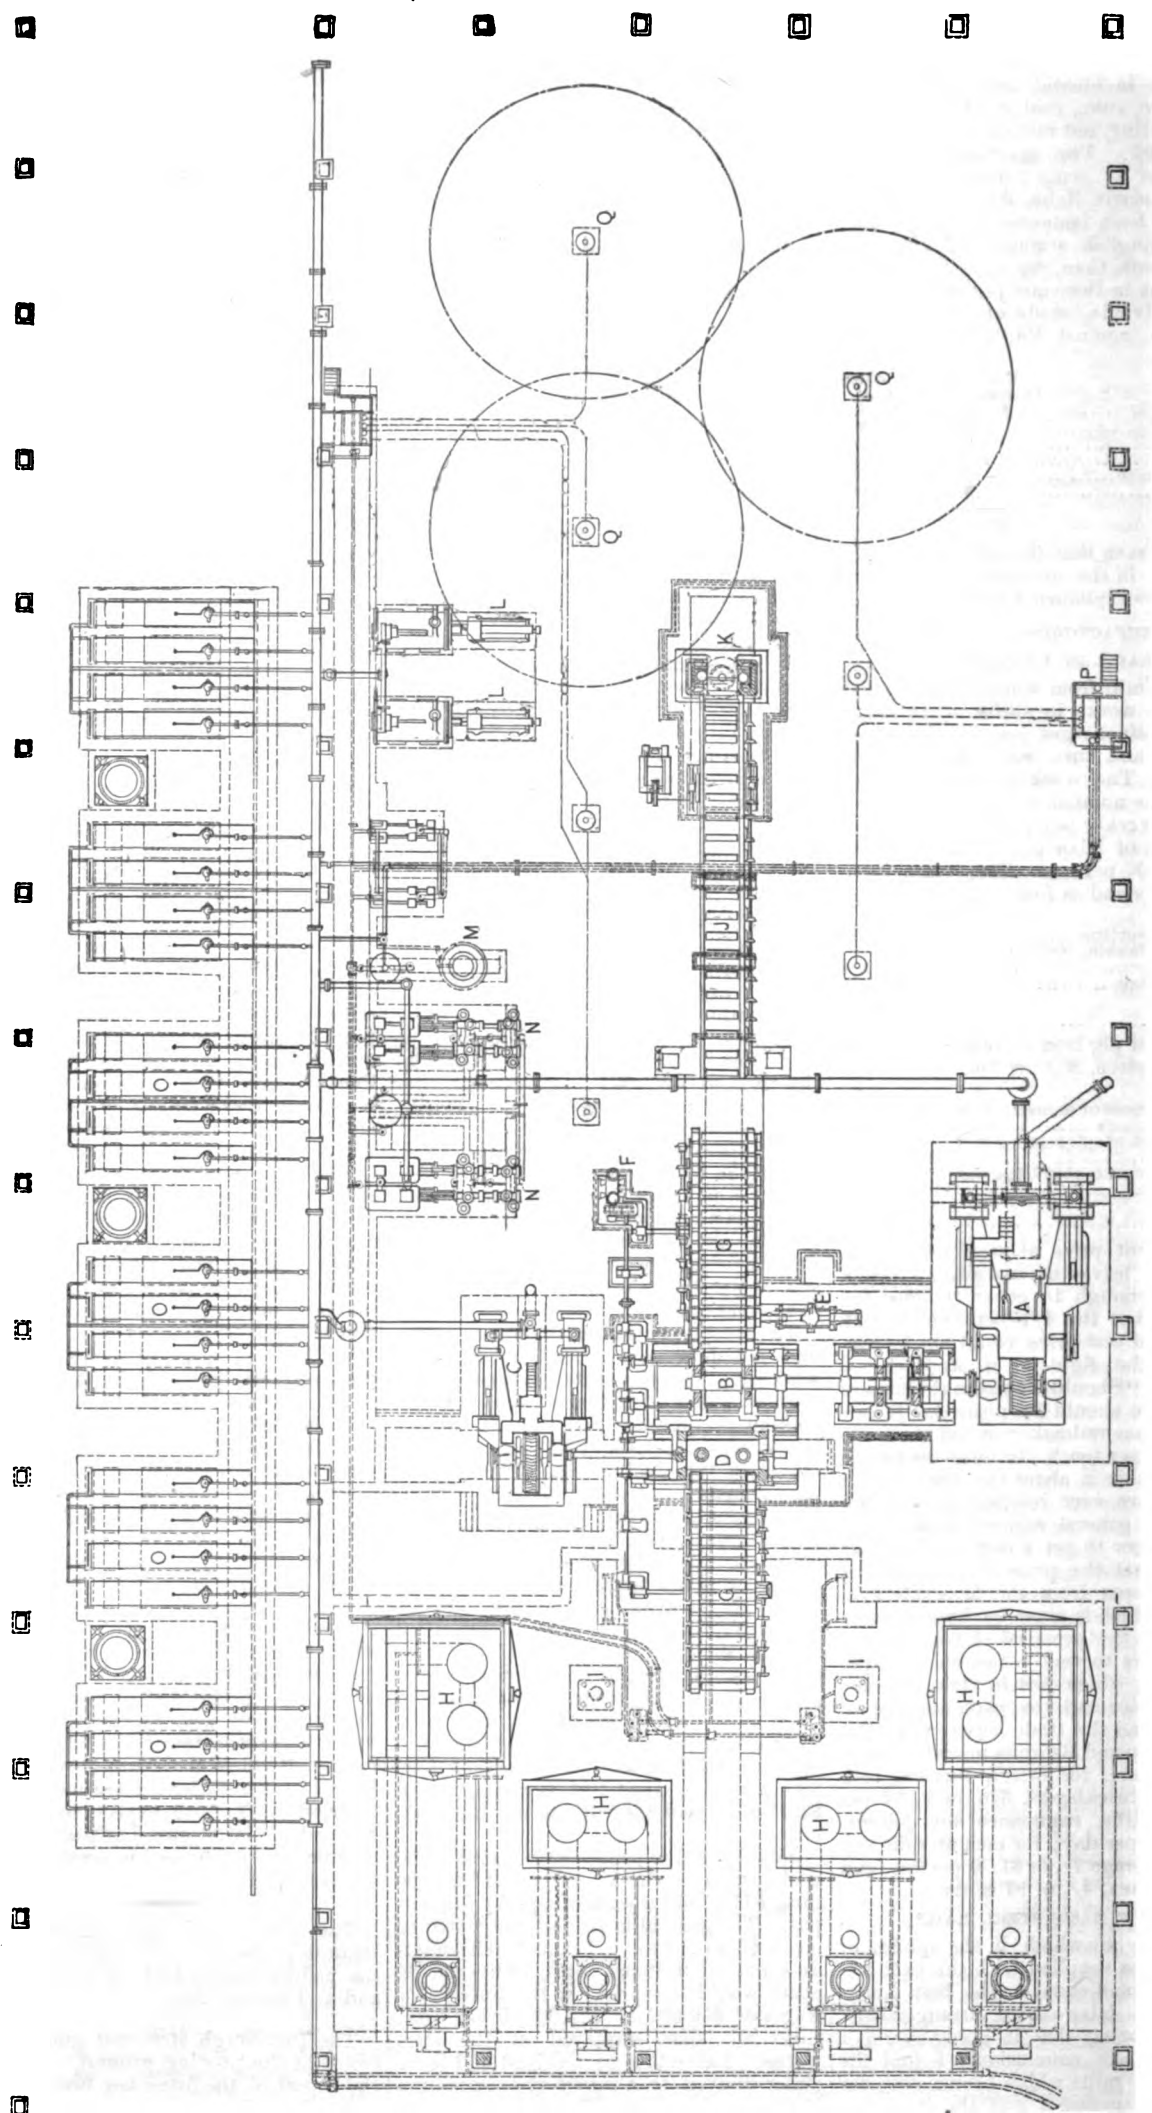

At \$27 a ton for spiegeleisen, the above \$4 represents 3 cwt. against 1½ cwt. in the English statement, which is balanced by 1 cwt. more of iron used in the Middlesboro' account, there is, therefore, in this account ½ cwt. more used than in the English mill. With \$3 of spiegeleisen 1½ tons of iron and \$2 worth of scraps are used, and with \$4 of spiegeleisen 1 ton of iron is said to be sufficient. While the English only use in all 1.175 tons of weight, this account would give us 1.30 tons of weight per ton of rails, which, if correct, would need further explanation than I can give at the present writing. At any rate, the difference in the weight would be returned again, or approximately so, in the value of scrap, ends, or misfits.

On the whole, it will need no demonstration to show what has been intimated in the opening pages of this report, that the differences in the labor cost, not alone of steel making, are not very great and come very nearly the English cost, but also in the materials used in its production. The difference of cost lies mainly in the transportation expense of the component parts of pig-iron used in the manufacture of Bessemer steel. The relative positions in steel rail making, as well as the fact of high wages, compatible with relatively cheap cost, may be realized from the comparative statement of the output of the two mills, which gave the subject of this report: Tons of Bessemer steel rails turned out per week in a steel mill in eastern Pennsylvania, 4500; total number of men employed, 1048; output of tons per man employed, 4.3; average wages per day, \$2.17½; labor cost per ton of all employed in steel mill, \$3.04; tons of Bessemer steel rails turned out per week in a steel mill in England, 1500; total number of men employed, 600; output of tons per man employed, 2.5; average wages per day, 5/6 = \$1.33; labor cost per ton of all employed in steel mill, 11/6 to 12/8 = \$2.80 to \$3.08.

[We have no means of checking the accuracy of Mr. Schoenhof's figures so far as they relate to English works. But they are certainly very untrustworthy where they deal with American works. The establishment referred to in Eastern Pennsylvania is obviously the Bethlehem mill. Nominally this concern has eight furnaces. In reality, one is practically abandoned, and for a long time, since the beginning of the present year, only six have been at work. In round figures, the capacity of the seven active furnaces—taking their work over a long period—is 2850 gross tons, so that Mr Schoenhof's reckoning is much out of the way. The figures in fuel are wrong, and the cost of ore is too low. The estimates of cost of producing rails at Bethlehem are certainly incorrect, because no sufficient allowance is made for waste. Yet we expect to have Mr. Schoenhof's latest guessing paraded before an admiring public as unquestioned statements of fact.—Editor.]

The four oscillating engines of the steamship Great Eastern, used for driving the paddle-wheels, had 72-inch cylinders and a 14-foot stroke.

The Pittsburgh steel-cast gun has been tested at the proving ground, but no official report of the firing has been received at the Navy Department.

GENERAL PLAN OF SLABBING MILL, CARNEGIE, PHIPPS & CO., HOMESTEAD STEEL WORKS.

The Homestead Steel Works.

We question whether during the past few years any single iron working establishment in the United States has developed more rapidly than the Homestead Steel Works of Carnegie, Phipps & Co., near Pittsburgh, nor are there many which can compare with it for ponderous machinery and the latest features in American practice. In some departments it occupies an exceptional position. Originally a rail mill, equipped with two small converters, it has expanded in a few years to the largest works for the manufacture of plates and structural material in the country. How rapidly some of the improvements were called into being may be understood when we state that possession was taken of that part of the ground on which the open-hearth works, plate mill and slabbing mill now stand, on the 26th of April, 1886. On the 14th of October in the same year the first of the open-hearth furnaces was in operation. It is particularly with these later parts of the plant with which we propose to deal, presenting in succession drawings thereof. The nucleus of the works were the mill of the Pittsburgh Bessemer Steel Company, consisting of two 5-ton converters, which made their first blow on March 19, 1881, and a 30-inch blooming train, and a 28-inch rail and billet train on which the first rail was rolled on the 9th of August of the same year. In times of great activity in the rail trade, this part of the works has produced rails, but its main work is to furnish mild Bessemer steel for the structural shapes rolled by the company. The greater part of the product of the open-hearth furnaces is used in the manufacture of plates.

THE SLABGING MILL.

We present a plan of the new slabbing and armor-plate mill. It is a building 800 x 120 feet, and a 35-foot lean-to for the boilers. The plant consists of eight vertical heating furnaces, H, 6 feet diameter in the clear, and a circular roof, the ring casting of which is of steel. They are grouped in the manner shown in our engraving. The two hydraulic charging cranes I are of the Aiken type, with a capacity of 35 tons. The main cylinder is 20 inches in diameter, with 13½-foot stroke, the height of the crane from the floor line to the bottom of the chord being 34 feet, while the swing has a 20-foot radius. The crane is swung by means of rack and pinion, the hydraulic cylinder having a 6-foot stroke and an 8-inch diameter. A small hydraulic cylinder at the end of the jib is used to grip the ingots by means of a very ingenious and simple tackle. The slabbing train itself consists of two sets of rolls, one of vertical steel rolls, D, 20 inches in diameter, driven by a special E. P. Allis reversing engine, 30 x 54 inches, C, and one pair of horizontal rolls, B, 32 inches in diameter, 60 inches long, driven by a pair of 40 x 54-inch E. P. Allis reversing engines, A, with power tables, G G. This train we shall describe and illustrate in detail in a future issue of *The Iron Age*. This train has already dealt with ingots 36 x 48 inches, weighing 38,000 pounds, and is capable of handling 25-ton ingots, 48 x 54 inches. The table rollers, all steel, are driven by the special engine F, a 10 x 12 Crane make.

The slabs are delivered to the table J, 74 feet long, the rollers being driven by a special engine, as shown. The slabs are sheared by a 3000-ton shear, K, details of which were published in a recent issue. At the time of our visit a gauge was being attached to the shear-table, to allow of the slabs being sheared to exact dimensions without taking any measurements. The shear is served by two pressure pumps, L, the largest of their kind,

built by the Southwark Foundry, of Philadelphia. They have a 65-inch steam cylinder, a 10-inch water cylinder and 8-foot stroke, and are worked at a steam pressure of 175 pounds, and are capable of yielding a water pressure of 4000 pounds per square inch. The general hydraulic service of the mill is supplied by two Wilson-Snyder duplex pumps, N, with 8 x 18 inch plungers, and an accumulator. Steam is furnished by six batteries of boilers, O, 44½ inches in diameter and 26½ feet long, the fronts having been built by Carnegie, Phipps & Co.

The crane service includes the two 35-ton charging cranes I, already alluded to, built by the Keystone Bridge Company; two 16-ton slab cranes, also built by the Keystone Bridge Company, and seven 5-ton slab cranes, built by the Southwark Foundry. At the time of our visit a line of 5-ton and 16-ton cranes was being placed along the outside of the building for handling and storing slabs.

Aside from the ponderous character of the machinery in this slabbing mill, and its spacious dimensions, the principal point which is sure to strike the visiting iron-master is the small number of men in so large a plant.

THE OPEN-HEARTH PLANT.

The open-hearth plant comprises four furnaces, No. 1 being a 15-ton basic; No. 4, a 20-ton basic, and Nos. 2 and 3, 40-ton acid furnaces. The latter have taken a maximum charge of 88,400 pounds, their average charge being 65,000 to 70,000 pounds. The furnaces are circular, using natural gas, the stack being placed back of the furnaces, with checker-work for preheating the air in the flues. On each side of these flues are narrow cooling flues. The furnaces are so placed that the charging is done from the general floor level, the steel being cast into a ladle, mounted on a central ladle crane capable of taking 40 tons of fluid metal, so that castings up to 100 tons can be made by casting from two or more furnaces. On either side of the ladle-crane are two semicircular casting pits, only a few feet below the general level, each pit taking four groups of molds, bottom casting being generally employed. The pits are flanked by 5-ton ingot cranes, four of which command the furnace itself, the ladle-pit and the casting-pits. There are 16 of these ingot cranes. At one end of the melting-shop a small steel foundry has been equipped with core-room, &c. A large number of castings have been made, among them some very large ones, already alluded to in *The Iron Age*. Near it a plant has been put in for making basic material, including a Gates crusher, a mixer and a calcining cupola.

THE PLATE TRAIN.

The plate train is housed in the same building with the open-hearth steel furnaces; the total length of the structure being 967 feet, with an 86-foot main span, and two 45-foot lean-tos. The train is served by six heating furnaces of special design, placed in two groups of three with their working doors in front of a circle. Their principal feature is that the ports are so designed that the entire hearth surface, 25 feet 1 inch by 6 feet 9 inches, is available for heating. Like in the open-hearth furnaces, the checker work is in horizontal flues, surrounded by air-cooling flues, the reversing valve being back of the chimney. The two semicircles of heating furnaces are commanded by two cranes, the ingenious arrangement of which quickly attracts attention. All the movements are controlled by one man perched on a seat facing four levers near the end of the jib. By means of a hydraulic cylinder he can grip the slab, with the aid of another controls the forward and backward movements of the car on which he is seated, and can thus deposit the slab within the range of the crane; by means

of a third lever he can raise and lower the jib, and with the aid of a fourth can work the rack and pinion which swings the crane. Their operation is exceedingly rapid and precise, and they have been the means of very materially increasing the capacity of the mill. We may mention that they have a reach of 44 feet to the back of the furnace. The plate train itself is three-high, with 32 inch top and bottom, and 24 middle roll; their width being 119 inches. On the roller's side it has one stationary table, 17 feet 10 inches long, followed by a feed table 80 feet long. A similar table is on the catcher's side. The train is driven by a 42 x 54 inch Mackintosh-Hemphill engine, with a 27½-foot fly-wheel, weighing 35 tons. It is served by a hand-roll crane on each side. The table on the catcher's side is followed by a table 22½ feet long, and then the plate is carried on to a series of tables aggregating in length 350 feet to the shears. By rollers driven by a special 8 x 12 engine, the finished plates are thus carried along slowly to the shears. The influence of this arrangement upon the quality of the plates and its convenience and economy of labor can hardly be overrated. Instead of being piled upon one another as soon as rolled, to cool irregularly, as accident may dictate, with the buckling and internal strains thus created, the plates cool gradually and uniformly. Ample time is afforded to mark them for shearing, for inspecting them carefully, for marking the position of the test pieces, &c. All this is accomplished with a minimum of labor.

Returning to the plate mill proper, we may note that it is equipped with two 6 x 18 feed pumps and three Southwark pressure pumps with 9-inch plunger and 18-inch stroke. Steam is furnished by four batteries of boilers connected with two stacks.

The plate traveling along the tables referred to reaches the shears, of which there are five, three large shears built by the Morgan Engineering Company, one scrapping shear and a trimming shear. In order to permit of easy and rapid handling, numerous casters are grouped about the shears, and from one to the other, and to a very simple and efficient scale arrangement. A platform resting upon a hydraulic cylinder is raised to carry the plates slightly above the level of the casters, and thus the weight is registered. There are in the shear department 13 5-ton cranes, and eight new ones are being put in along the outside of the building to facilitate shipping and stocking plates.

At the time of our visit there were lying ready for shipment four plates of exceptional size, which may serve to illustrate the capacity of the plant to turn out heavy work. These plates were 2 inches thick and 108 x 120 inches, their weight being 7000 pounds.

Reviewing the equipment, it will be noted that it possesses exceptional, and, we may say unrivaled, facilities for handling heavy plates and for putting work into the steel. The slabbing train through its construction secures a thorough working of the sides of the ingot.

We may mention here that it is the plan of the management to use the train also for rolling octagonal shapes so that heavy shafting will become a specialty of the works. In rolling plates the slabs are cut into such lengths that the first reductions in the plate mill are made by rolling in a direction normal to that in which the steel was worked in slabbing. Thus the material is worked in both directions and the distinction of tests in the direction of rolling and vertically to it lose much of their force, if, in fact, it does not entirely disappear. An incidental advantage of this method, costly though it may be in the way of investment in plant, is the reduction in the amount of scrap made.

Another striking characteristic of the works is the economy in labor. Practically the trains are automatic and the handling is reduced to a minimum. The facilities for the shipment of goods, with the additions to the crane service now being completed, are exceptional, and place the company in a position to fill orders within a very brief time.

The New Navy.

In briefly reviewing the work on the new ships of the navy, the *Army and Navy Journal* says:

The work on the Chicago still continues at the New York yard, and it is hardly probable that she will be put in commission much before the first of next year. The double-turreted monitor *Amphitrite* was lately taken out of the dock at Wilmington, Del. Her bottom has been painted and otherwise fixed up. The department has as yet reached no decision as to whether the ship will be rebuilt at a private yard or at some navy yard. The new cruiser *Charleston*, now building at San Francisco, Cal., will be completed about January 1, the contract time, as the department is in receipt of reports from the contractors saying that the work is progressing very rapidly, and that the ship will be turned over to the Government at the time specified. Of course she will be assigned to the Pacific station, and will be the flagship.

The Philadelphia *Inquirer* says: "The Philadelphia, it is expected, will beat the Baltimore in speed, as Messrs. Cramp will supply their own engines to the former, whereas the firm of Humphreys & Tennants; England, will provide the motive power for the latter. In the one case Messrs. Cramp guarantee a speed of 19 knots; in the other they only guarantee horse-power. It will be interesting to compare the work of the two sets of engines when both vessels are in commission. The model of the Philadelphia, although an English design, is considered by the Messrs. Cramp to be a very good one, and capable of but little improvement in view of the work the vessel will have to perform. The dynamite cruiser *Vesuvius* was sent down the river, October 1, to try how the engines worked. The affair was kept very quiet, only a privileged few being notified of the event. So far as could be learned, the trial was a most successful one, the vessel showing extraordinary speed, making a run of 13½ miles in 29 minutes, being an estimated speed of nearly 27 miles an hour. As the guaranteed speed is only 20 knots an hour, this, if correct, is eminently satisfactory. Allowance has, however, to be made for the tide, which would deduct about two knots off the record, but even then the result exceeds the expectations of the builders."

We learn that everything worked well on this trial. There was no heating of journals and no leaks anywhere and very little vibration. Two hundred and forty revolutions were reached without effort, but no measurements of speed were taken, as the trial was only made to find defects in the engines, if any existed. One of the builders has written to an officer of the War Department that a speed of 20 knots was obtained with a pressure of only 135 pounds. All indications point to additional speed when the full working pressure of 180 pounds is put on, and it is then expected fully 28 knots will be made.

In the naval appropriation bill, approved September 7, 1888, provision was made for the construction of seven new vessels, and an appropriation of \$5,550,000 was made, and an additional appropriation of \$260,000 for a composite ship to be used as a practice vessel for the midshipmen at the Naval Academy. Secretary Whitney has

now under consideration a number of designs for these new ships, and as soon as the designs are adopted, work will be immediately started on the plans and specifications, and the contracts awarded.

Tests of Rivet Steel.

In the course of an interview, published in the New York *World* on September 21, Commander R. D. Evans is quoted as saying, in illustration of an alleged improvement in the quality of steel furnished as the result of the operations of the Navy Department during the past few years:

When the first contracts were made by the present administration of the Navy Department it was considered exceedingly doubtful if rivets, or rivet stuff, showing an elongation of 30 per cent. in 8 inches and an ultimate strength of 50,000 pounds per inch could be obtained in this country. Such material was finally made by firms in Pittsburgh, and it created comment all over the professional world. Under the present contract for the Maine and the specifications furnished by the Navy Department, the rivet material averages 33 per cent. elongation in 8 inches, and an average ultimate strength of 56,000 pounds per square inch. Such material as this at the time of the original contracts, or the first contracts made by the present administration of the Navy Department, would have been considered absolutely impossible.

The choice of this particular example by Commander Evans was unfortunate, since there are on record figures proving that steel rivets of high quality were made for the navy prior to the time stated. We have before us a report by Prof. W. H. Burr, of the mechanical laboratory of the Rensselaer Polytechnic Institute, at Troy, dated November 23, 1883, which contains the following series of tests:

Number of specimens.	Diameter of specimens in inches.	Pounds of stress per square inch at		Per cent. of final stretch in 8 inches.
		Elastic limit.	Ultimate resistance.	
2.....	0.73	40,100	62,600	26

27.....	0.725	38,740	62,200	25
28.....	0.73	39,600	59,200	29
29.....	0.73	41,050	64,440	28
30.....	0.73	38,200	60,200	28
31.....	0.73	37,300	61,200	28
32.....	0.73	38,400	60,200	30

The specifications called for an ultimate tensile strength of at least 60,000 pounds, and a final elongation in 8 inches of not less than 23 per cent. An excess over 60,000 pounds was allowed, provided the ductility remained at least 23 per cent.

Heating Rolls by Gas.—London *Engineering* illustrates and describes a device for heating rolling mill rolls by gas. The latter is burned in jets, which are uniformly distributed the whole length of the rolls at each side. When these jets are lighted and the machine is put into slow rotation, every part of each roll is gradually and uniformly heated without the

production of any dangerous strains. This method of heating rolls we understand is in use by Messrs. Bolckow, Vaughan & Co., the Dowlais Iron Company and the Steel Company, of Scotland. In one mill the average life of the rolls previous to the application of the gas was 79½ days, and, after the application, 342 days. In another large plate mill, with rolls 36 inches by 9 feet, and weighing each 17 tons, two rolls only have been broken, and both cases were due to the neglect of the men in charge in not turning on the gas. Even these rolls ran 342 days each. The device is the invention of Mr. Franklin Hilton, of Middlesboro'-on-Tees.

Cost of Iron Making at Troy.

During the course of the Burden trial at Troy, John H. Allen, expert accountant, testified as follows:

The books of the Burden Iron Company showed that in April, 1886, the quantity of Hudson River ore used in the mixture at the Burden works was 25 per cent. After that it was increased, until in January, 1887, it was 50 per cent., and it had remained at 50 per cent. ever since, down to September, 1888. The quantity of this ore received in 1885 by the Burden Iron Company was 56,080 tons, in 1886 it was 10,475 tons, and in 1887 it was 11,661 tons. The cost in 1885 was \$3.11 $\frac{1}{4}$ per ton, and in 1886 it was \$3.13 $\frac{1}{4}$. These figures show the cost of the ore laid down at the works. The average of pure metallic iron in the ore, as shown by the company's analysis book, was 45.54 per cent. in 1884, 43.26 per cent. in 1885 and 43.98 per cent. in 1886. The average cost of pig iron made by the Burden Iron Company in 1883 was \$21.48. The output was 15,798½ tons. In 1884 the cost of pig iron made by the company was \$18.33 per ton, and the output was 23,583½ tons; in 1885 the cost was \$17.38 a ton, and the output was 13,578 tons; in 1886 the cost was \$18.96½ a ton, and the output was 15,197 tons; in 1887 the cost was \$19.17½ a ton, and the output was 9132 tons. January 1, 1885, there were 5496 tons of pig iron on hand, according to the inventory, and it was rated at \$17.50 a ton. January 1, 1886, there were 8571 tons on hand, inventoried at \$16 a ton. January 1, 1887, the inventory showed 7064 tons on hand, and the value was fixed at \$16.50 a ton, and January 1, 1888, there were 6668 tons inventoried at \$17 a ton. The cost of making iron at the Burden works this year was stated as follows: January, \$18.20; February, \$19; March, \$18.94; April, \$17.53; May, \$20.61; June, \$24.01; July, \$23.36; August, \$19.12; September, \$17.09. Other figures were given showing the cost of pig iron other than that of the Hudson River company, with the intent to establish the allegation that as good a grade of ore could be laid down at the Burden works at a less figure than was paid the Hudson River company.

The channel span of the Chesapeake and Ohio bridge at Cincinnati was successfully connected on Saturday. Work is well along on the remaining shore span, and the company expect to be running their cars into Cincinnati by December. The railroad along the Ohio River, which connects with the bridge, is about completed, and will be turned over to the Chesapeake and Ohio in a few days.

The high railway speeds recently attained on several English roads show that where sufficient inducement offers modern railway appliances are capable of approaching very closely to the apparent limit of 1 mile a minute.

Riverside Iron Works, Wheeling.

During a somewhat hurried visit to the Nail City, a representative of *The Iron Age* had occasion to inspect a part of the plant of one of the most important and progressive enterprises of Wheeling, the Riverside Iron Works. During the past few years its management has led in the momentous changes which have relegated puddled iron to an inferior position, and have won for Wheeling the distinction, of occupying beyond the question even of its rivals the position of arbiter of the cut-nail trade, and of shaping largely the course of the trade in soft-steel billets and slabs. To the Riverside Iron Works individually belongs the credit of leading in the substitution of soft steel for iron so far as nails, tubes and pipe are concerned.

THE RIVERSIDE FURNACE

is a 16 x 75 foot stack, with a 9-foot crucible and a 6-foot bell, the stockhouse being 90 x 175 feet, the stock being lifted by an

I. P. Morris engine, with 36-inch steam cylinder, 7-foot-blowing cylinder and 6-foot stroke, and by a smaller Mackintosh, Hemphill & Co.'s engine, with 30-inch steam cylinder, 7-foot blowing cylinder and 4-foot stroke, the limit of pressure being 7 pounds. Steam is furnished by five batteries of 40-inch plain cylinder boilers, 52 feet long fed by a doctor. The smoke stack is 170 feet high by 9 feet diameter in the clear. The furnace has two cinder notches and an admirable arrangement for handling the cinder, being taken off laterally to a series of discharge troughs to the cinder cars, which are handled by a locomotive. The wall above the iron notch is cooled by four pipes entering the brick wall 18 inches. The casthouse is 170 x 55 feet. Near the furnace is a foundry in which all the castings for the plant are made, a machine shop and a carpenter shop.

THE STEEL WORKS

contain two five-ton converters, placed side by side before a 35-foot pit. The three 8-foot cupolas are located on one

Otis hoist. The ore used is Pilot Knob, Colby, Iron King and Republic, an ingenious system of charging having been adopted. The charging area is divided into four quarter sections. In order to properly distribute the fine ore the different classes of ore are charged in accordance with a schedule, a copy of which is framed under glass in the stockhouse and on the top, and appended herewith. Taking into account the fact that the Iron King and the Colby are the soft ores, while the Republic and the Pilot Knob are hard, it will be observed that the same even and odd numbers placed opposite one another are always soft on the one side and hard on the other. In order to prevent the uneven distribution of the stock, which grows out of the fact that the bell in descending swings in an arc, a part of the circle of which the length of its lever is the radius, a roller is provided which guides it vertically. The result of the system has been an increase in the life of the furnace, one campaign having given 88,000 tons on one lining and the last over 100,000 tons. The furnace is equipped with four Player hot blast stoves, yielding a blast temperature of 900° F. The blast is furnished by one

side of the pit, and opposite to them is the crane for handling ladles and bottoms. The distinguishing feature of the plant is that the iron ladle is handled by an overhead Morgan crane, an arrangement which does away with troublesome gutters, and permits of pouring the iron without any waste whatever. It has been found, however, that the dust naturally incident to Bessemer works has a prejudicial effect upon the crane machinery, causing delays and breakdowns through rapid wear. The overhead crane is also used to put on the bottoms. The two converters are served by one central ladle crane and an ingot crane, a hydraulic pusher being provided to strip ingots which have been stuck. The ingot crane deposits the ingots on trucks which are switched out of the works on to the track which takes them to the crane commanding the heating furnaces and the table of the blooming train. The plant which was built for a capacity of 100 tons of soft steel ingots per turn has far outstripped that figure, 191 tons of ingots having been made in one night shift recently, in 46 heats, which has been the highest record thus far. The slower cooling of mild steel, generally speaking, makes the pit capacity even more a factor

than in rail steel work, and in the special case of the Riverside mill the crane service is somewhat inadequate toward handling output regularly so far beyond the first plans. The steel made ranges in carbon from 0.08 to 0.09 with 0.30 to 0.40 manganese, the ferromanganese being pre-heated.

The blooming train is a 26-inch Mackintosh, Hemphill & Co., driven by a 28 x 42 inch reversing engine by the same firm, and equipped with a shear by the same makers, the ingots rolled weighing about 3100 pounds. It is served by two heating furnaces and runs alternately on slabs and billets, being more than able to keep up with the converter capacity on the one and not quite with the other form.

In a line with the steel works is

THE NAIL PLATE AND SKELP MILL.

which contains a two-high 21-inch nail-plate train with three stands. It is now being changed to 3-high. It has a capacity of 80 tons in 24 hours and is equipped with two regenerative gas heating furnaces. The same engine, with 36-inch cylinders and 6-foot stroke, drives a three-high 21-inch skelp train, with three stands of rolls. The nail-plate train is served by three nail-plate shears, while the skelp train has two skelp shears and one nail-plate shear, all driven by a special engine, which runs also two grindstones and two roll lathes. The skelp train has two heating furnaces, which, like the others in the plate mill, are arranged to use either producer gas or natural gas. The nail-plate train handles about 20 heats in 24 hours, while the skelp train takes 14 heats, rolling skelp from 15½ inch down to 5½ inch, the quantity being about 60 to 70 tons in 24 hours. At another mill in Wheeling, owned by the company, they have additional capacity to roll 65 tons skelp daily. The nail plate is conveyed to the nail factory of the company, which has the distinction of being the largest in the world, the number of machines being 224. A part of the steel skelp is sold in the open market, the greater part of it, however, being worked in

THE NEW TUBE MILL

of the company, the building of which for making steel tubes being a bold step in the direction of progress, which has been fully justified by success. We have repeatedly alluded to the quality of the product. Suffice it to say that a series of specimens are exhibited at the office at the mill, which show that not alone the material itself, but the weld, too, can endure exceptionally severe torture. So far as the material is concerned, we have during our visit seen pieces of the skelp taken at random among the pieces as they fell from the shears bent back and forward at right angles 14 times before the first signs of fracture appeared. Among the most interesting tests of the pipe itself were pieces of it plugged at both ends and then submitted, filled with water, to extreme cold. While iron pipe under identical conditions split, the steel pipe resisted the strain, the malleable iron plug giving way. In another case the end was welded up, and then only a slight bulge told of the strains to which the specimen had been submitted. The mill itself is a building 300 feet wide, in three spans, and 300 feet long, and has the necessary outbuildings, machine shop, blacksmith shop and store houses. In the lap-weld department, in which 8 inch down to 1½ inch lap-welded pipe are made, there is one scarfing and bending furnace, and one welding furnace. At the time of our visit double extra heavy 4-inch pipe ½-inch thick were being made there. In the butt-weld department there is one bending and two welding furnaces. The mill is equipped with hot and cold straightening machinery, hammers for welding couplings, tapering and tapping machines for couplings and threading machines for pipe, and hydraulic presses, every tube

sent out of the mill being tested by hydraulic pressure. The general arrangement of the plant is excellent, the skelp entering the mill on one end, and the finished pipe being delivered at the other end. They contemplate doubling their capacity in the near future.

So far as the use of mild steel as the material for pipes and tubes is concerned, its behavior during the different stages of manufacture is well calculated to remove any doubts in the minds of those who may have had occasion to watch the stock as it passes from one manipulation to the other. No split ends or imperfect welds were observed. In the butt-welding department the exact point where the half-finished tube had been gripped by the first die could be located by the weld, and throughout the markings for cutting off the end of the welded pipe were from less than 1 inch to about 3 inches from the rough end. This material has been found to be admirably suited to the manufacture of boiler tubes, one maker having purchased and used not less than 3000 tons during the past six months. One of the principal difficulties anticipated was that of threading the pipe. Unlike iron, which crumbles, the soft steel curls up in shavings, hugging the die closely, preventing thereby the oil from getting to the cutting edges of the dies. This difficulty has been overcome, to judge from the appearance of the threads on the piles of pipes which were lying ready at the mill for shipment.

Slipping at High Locomotive Speed.

Some ten years ago, says the *Railroad Gazette*, M. Rabeuf, an engineer on the Northern Railroad of France, noticed the slipping of locomotive drivers when running (and using steam) down grade, even without any train load to haul. He made several observations, and concluded that this slipping increased in some ratio to the speed, and that it was much greater at the same speed in descending than in ascending grades. He found, by measuring the distance run, and noting the number of revolutions made by the drivers in that distance, that the circumference of a driver multiplied by the number of revolutions, gave a product of from 13 to 25 per cent. greater than the distance. That is, fuel was wasted and tires and rails worn out by useless revolutions of the drivers. Several explanations of the phenomenon observed by M. Rabeuf were offered at the time, and within a year M. Durand-Gréville has published in the *Revue Scientifique* the remarkable theory that in going down grade the wheels tend to get away from the rail by the amount of the vertical component of the motion of the locomotive, and in going up grade they tend to approach the rails by the same component. Hence, he reasons, there is less adhesion in going down grade and increased adhesion in going up. M. A. Stévant takes, in a recent issue of *L'Industrie Moderne*, space to state the theory of M. Rabeuf and the more or less ingenious explanations of it, and to show that these explanations are mechanical illusions. This he does very prettily, but one is surprised to find that after all the ingenuity and erudition which he has expended on the subject he accounts for the phenomenon by the simple and conclusive statement that it does not exist. M. Stévant says that he made numerous runs between Liège and Verviers, registering the revolutions of the drivers, and found "no appreciable difference between the measured distance and the development of the circumference of the drivers multiplied by the number of revolutions." The distance between these stations is about 14 miles, and the difference of altitude about 400 feet. Moreover, M. Stévant made various long runs at high speeds with coupling rods removed, and found no appreciable

change in the relative positions of the crank-pins. He quotes various authorities, who sustain his position, that this particular kind of slipping does not occur. It seems probable that M. Rabeuf's figures were the result of the singular conditions under which he made his experiments, putting the reverse lever in full gear when running down grade.

The statement that engines slip continually while running at a full speed is often made, but almost invariably by persons of no practical experience, who appear to be unaware that any slip of the drivers can be instantly detected by an engine runner. Any one who has run a fast train knows that on entering a damp tunnel slipping occasionally occurs, but the vibration imparted to the engine is so peculiar that no one who has once felt it is likely to fail to recognize it again. Messrs. Abbey and Baldwin, when making some observations on the running of a Jersey Central express passenger engine on the Bound Brook route, found that the slip at high speed was practically nil. The wheels, as calculated from their diameter, should give 298.98 revolutions per mile. A counter showed that 298.62 revolutions per mile had been actually made, the difference being negative and only one-third of a revolution per mile, or within the limits of errors of observation. As these engines are run very hard and made to do their utmost, it might reasonably be expected that they would show slip, if any existed, at high speed. It is therefore reasonable to suppose that any continuous slipping at high speed is non-existent. The continuous slipping theory is supported by so very little evidence, either practical or theoretical, that it must take its place among the numerous other pseudo-scientific delusions.

German Prices for Steel Rails.

The *British Trade Journal* prints the following information concerning the prices obtained for steel rails by German makers. It shows very clearly that the German mills have everything to gain by a renewal of the international combination. They had a monopoly of the Government orders for rails according to the terms of the old agreement, were able to obtain an average price of £7 per ton, whereas, when the combination collapsed the price fell under the influence of Belgian and English competition, to £5. 8/. The following table shows the total of the Government contracts with the German works for the years enumerated, and the average price in each year at which the contracts have been accepted:

	Tons.	Average Price.
		£ s. d.
1884-85.....	71,300	7 15 0
1885-86.....	75,970	7 6 0
1886-87.....	75,563	7 3 0
1887-88.....	74,321	6 6 4
1888-89.....	78,763	6 5 0

These prices, of course, do not represent the rates at which rails have been sold for export. Last year, for instance, while the average interior price was £6. 6/4, the export price fell to £4. 12/. It is pointed out, however, that even if it declined to £4, the average of the export and interior prices realized by the German works would still show a comparatively good return. The following table shows the quantities exported and the average price for export in each of the past six years:

	Tons.	Price.
		£ s. d.
1882.....	186,054	6 10 4
1883.....	176,177	5 10 0
1884.....	144,463	5 17 5
1885.....	164,799	5 10 7
1886.....	163,221	4 13 0
1887.....	174,226	4 12 0

The considerable differences in price will be observed.

American Forestry.

The annual report of the division of forestry, Department of Agriculture, recently issued, contains some very interesting information. From an inspection of the import statistics it appears that the import duty laid upon manufactured lumber in 1872 had the effect at first of decreasing importations from Canada by from 50 to 60 per cent. until 1876-77 when an upward tendency of imports began. A comparison of the imports of the last three years with those of the preceding three, however, shows a noticeable decline in all classes of foreign products from the amounts to which they had gradually increased up to 1884, when the importation of manufactured lumber reached nearly the same amount that was imported in 1872. "For the decrease in unmanufactured wood," said Mr. Fernow, "the Canadian export duty of \$2 on logs may serve as an explanation, but other causes must have worked to effect the reduction of manufactured lumber in the face of a decided enhancement of value of product. The difficulty of access and increased distance from the market is probably the explanation." At the present stage of development, it is suggested that, so far as the saving of standing supplies is concerned, there need be no fear or hope from foreign competition, for the "quantity of standing pine in the United States and Canada is reduced to a condition of absolute control; it is held in strong hands on both sides, and will not be lightly frittered away." The stumpage price, it is predicted, which has lately advanced as never before, will necessitate the upholding of present values for manufactured lumber, and an advance of prices is as certain as a decrease of supplies. "An unbiased weighing of the arguments advanced on both sides," says the report, "leads to the conclusion that the removal of the tariff on lumber would have no appreciable effect upon the price to the consumer, nor be detrimental to the lumberman's or sawmill business, nor in the least affect the laboring man; but at the same time no appreciable benefit toward preservation of forests and forest supplies need be expected at this date from such removal." The report concludes with brief reviews of the condition of the forestry interest in each of the several States and Territories.

Oil at North Chicago.—The North Chicago Rolling Mill Company are now running 14 boilers at their South Chicago Works exclusively with oil for fuel. Thus far the results have been very satisfactory, but the managers of the company are not prepared as yet to express a definite opinion in regard to it. The oil is now being conveyed to the works in tanks, but a pipe line is contemplated from the South Chicago storage tanks, which will probably be built as soon as the tests now being made are pronounced conclusive. D. S. Mathias has been appointed superintendent of the South Chicago Works, to succeed J. W. McGinnis, who resigned a short time since.

The Phosphor Bronze Smelting Company, Limited, of Philadelphia, have issued a price list, No. 6, for October. It makes the price of Nos. 1 to 20 roll and sheet phosphor bronze, 2 to 6 inches wide 48 cents, which increases for higher numbers and greater widths. For phosphor bronze wire Nos. 1 to 16 the price is 50 cents a pound, for telegraph wire, Nos. 6 to 13, 35 cents; for telephone wire, Nos. 14 to 16, 45 cents; for $\frac{1}{4}$ inch wire rope, 28 cents per foot, increasing to \$1 per foot for 1 inch. These have 19 wires to the strand. Phosphor bronze wire-cloth, 2-

mesh No. 16 wire to 24 mesh No. 30 wire, is 50 cents per square foot. Cast bolts and nuts, $\frac{1}{4}$ to 1 inch, are quoted 45 cents per pound, and a table of prices is given for wood screws.

The Waterhouse Arc Lamp.

The Waterhouse electric arc lamp, of which we present details on this page, embraces several novel and interesting features. The form of magnet differs from all other arc lamp magnets. The lifting mechanism is free from friction, and owing to the simplicity of construction does not require expert care. Only one adjustment is necessary. The magnet is in the shape of quadrangle with four poles, two of them of constant and two of variable polarity. Under the variable poles is pivoted the armature A, which is held in position when

site effect upon the poles of the magnet, under which is the armature A. The result is less magnetism in the poles, and the armature will recede slightly, easing up on the clutch and allowing the carbon rod to feed. The carbons now being in the original position, the current again flows around the main coils as at first. The armature A is so susceptible to the changes of magnetism that a fine feed is maintained free from sudden commotion, and this is one of the important features of the Waterhouse system, which assists not a little in the production of a steady arc light. Adjustment is made by the screw S strengthening or weakening the spring S', so as to maintain a constant fine feed, which is an adjustment easy to make.

The lamp is provided with an automatic cut-out, and much attention has been paid to insulating the various parts and adapting the same to the convenience of the trimmer. The Waterhouse Electric and

ing the boilers. About this time was introduced the surface condenser, which, by separating the condensed steam from the condensing water, enabled the boilers to be supplied with fresh feed-water, and thus, by largely preventing the dangerous incrustation on the heating surfaces of the boilers, which resulted from lime and other scale when fed with sea water, enabled the pressures to be still further increased without increased danger due to liability of overheating of plates. This change of type of condenser, therefore, is very intimately connected with the increase in steam pressures, for most of the beneficial results which have followed that increase would have been impossible had not some such contrivance been introduced for keeping the deposit out of the boilers.

Like many other improvements, its general application in practice was delayed for many years after its invention. It was applied in a very similar form to that now used in modern engines as long ago as 1832, but became a usual adjunct of the marine engine only about the year 1860. With the old jet condenser a pressure of at the most 25 pounds per square inch was considered the highest it was prudent to carry in marine boilers, owing to the liability to overheating, and consequently danger of failure of the heating surfaces, due to the accumulation of scale from the salt water feed used. The adoption of the surface condenser almost entirely removed this difficulty. The loss of fuel with the jet condenser, through the necessary practice of blowing out the boilers in order to keep the density within limits, was also avoided by the surface condenser. At least 15 per cent. was the estimated saving of fuel by its use as given by the superintending engineers of the principal steamship owning companies at the time of adoption. Between 1860 and 1870 a large number of engines with surface condensers were fitted in vessels of the Royal Navy, the steam pressure being immediately increased, and was during this period usually about 30 pounds per square inch.

The engines of all the jet condensing vessels were of the simple expansion kind, the steam of low pressure being taken into the cylinder from the boiler, carried late in the stroke, and exhausted direct to the jet condenser. Only a very small amount of expansion was carried out, and with the low pressures then in use the gain to be derived from the expansion of the steam was necessarily of small amount, so that the consumption of fuel for a given power in engines of this kind was very high. During, however, the period above mentioned as that immediately following the introduction of the surface condenser, with the higher steam pressure of 30 pounds per square inch, the principle of expansion was adopted to a much greater extent, and the cylinders were made much larger, so as to allow of a considerable amount of expansion at full power, and considerable benefit was thus experienced in economy of fuel. To the engines of the period of which we are now speaking steam-jacketed cylinders were fitted, and although the gain to be derived from the use of a steam jacket was at that time a subject of great controversy, there is now no doubt that it was a very valuable adjunct, especially to the expansive engine then being made. Of similar use were the superheaters that were fitted to the boilers in connection with these engines. They consisted of an amount of heating surface in contact with the hot escaping gases of the boiler through which the steam passed on its way to the cylinder, and served the double purpose of utilizing some of the heat of the gases and also of increasing the efficiency of the steam. The steam jacket is still in existence in most modern engines, but the superheaters are now obsolete.

THE WATERHOUSE ARC LAMP.

no current is passing through the lamp by the supports B and the spring S'. The tension of the spring S' is changed by means of the screw S, so that more or less assistance can be given to the armature A by the spring S' as may be necessary to form the proper arc. Attached to the armature A is the clutch C, through which the carbon rod R is inserted, and it will be noticed that the air dash pot D is also connected to armature A, and any sudden motion of the armature upward is opposed by the dash pot D, or downward by the spring S'.

The current coming to the lamp enters at the terminal near the handle H, passes around the coarse wire coils on the magnet M, then to the carbon rod R, through the carbons and returns to the opposite terminal of the lamp, when it passes out on a conductor to the next. The current flowing around the main coils produces magnetism in the poles of the magnet M and draws up the tongue of the armature A into the elongated hole in the magnet M, and also lifts the armature A from the supports B. Drawing up the armature A actuates the clutch, which lifts the carbon rod R, and it in turn raises the upper carbon, and the arc is formed. As the carbons burn away, causing greater separation than at first, the resistance becomes stronger in the conductor around the main coils, and the instant it is greater than in the shunt coils a portion of the current will take that path through the shunt around the arc. The shunt coils produce an oppo-

sition effect upon the poles of the magnet, under which is the armature A. The result is less magnetism in the poles, and the armature will recede slightly, easing up on the clutch and allowing the carbon rod to feed. The carbons now being in the original position, the current again flows around the main coils as at first. The armature A is so susceptible to the changes of magnetism that a fine feed is maintained free from sudden commotion, and this is one of the important features of the Waterhouse system, which assists not a little in the production of a steady arc light. Adjustment is made by the screw S strengthening or weakening the spring S', so as to maintain a constant fine feed, which is an adjustment easy to make.

High Pressures in Marine Engines.

In the first of a series of articles on "The Development of the Marine Engine in the British Navy," the *London Engineer* gives the following interesting account of the increase of steam pressures and of the changes of types of engines which are intimately connected with that subject:

In the first steamships that were used in the navy—small vessels that were purchased complete—the steam pressure was about 4 pounds per square inch. The first of these came into the service rather more than 50 years ago, and represented the usual practice up to about the year 1843, the type of boiler being the flue variety. At about this date the flue boiler began to be superseded by the tubular, and the working steam pressure rose between the latter date and 1850 to about 10 pounds to 12 pounds per square inch, 12 pounds representing very accurately the practice about the year 1850. Between 1850 and 1860 the pressure rose to about 20 pounds per square inch. Up to this date the condenser in use was the old jet condenser, in which the condensation of the steam was effected by actual contact with a spray of sea water, the condensed steam became mixed with the salt water, and the mixture, which was but little fresher than sea water, was used for feed-

There can be no doubt that these expansive engines, with steam of only 30 pounds pressure per square inch, with steam jackets, superheaters and surface condensers were fairly economical, and were a great step in advance from those immediately preceding them.

The introduction of the surface condenser having proved a practical success, and there being now nothing to prevent higher pressures than the 30 pounds per square inch then in use being employed, attention was at once directed to the subject of higher pressure and the more complete utilization of the property of expansion in increasing the efficiency of the engines, a direction which theoretical considerations marked out as being a most prolific one. The result was that the steam pressure went at one step from 30 to 60 pounds, the type of boiler being changed to the cylindrical variety to carry this increased steam pressure safely, and the engine was completely changed to the compound type, in which the steam is first passed into a small cylinder, and at the end of the stroke in that cylinder is passed into one or more additional larger cylinders, and does there a further amount of work, and completes its expansion before being finally exhausted into the condenser. Perhaps no point caused more difference of opinion among engineers than the advantage or otherwise of the compound system. Its first application, indeed, was not a success, but this was made under unfavorable circumstances which were subsequently removed, and since then the system has been remarkably successful, and has caused a considerable impetus to be given to navigation.

In the compound engines the steam-jacket of the earlier types was retained as beneficial, but the superheaters were abandoned. The principal reason for each of the successive steps in the increase of steam pressure which has from time to time been made has always been the gain in economy which resulted, and the amount of this gain in economy by the compound engines using steam of 60 pounds steam pressure over the best previous type of simple surface-condensing engines with 30 pounds of steam pressure, by the adoption of this principle, was about 30 to 35 per cent. This gain is now well authenticated, and the amount mentioned above is the average of the replies given to questions of the Admiralty Committee on Designs of Ships of War, which sat in 1872, by the principal engineers and steamship owning companies.

Since about 1872, and up till very recently, the new engines of the Royal Navy have all been compound. The first of them, as mentioned above, had steam pressures of 60 pounds per square inch. This was increased in a few cases to 70 pounds and 75 pounds after a short time, and about the year 1880 to 90 pounds, the ratios of cylinder areas and the expansion allowed being increased with the steam pressure, so as to more fully benefit by expansion. From this date the rise of pressure has been rapid up to 120 pounds. Very recently, as is well known, attention has again been directed to the engine; and the compound engine being seen to possess defects at these higher pressures similar to those of the simple engines, it has been abandoned in favor of the triple-expansion engine, in which the steam is passed consecutively through three cylinders before being finally exhausted to the condenser. The success of this type, too, has been very striking, and for new engines it has completely displaced the compound type. Since 1885, with a few minor exceptions, all new engines of the Navy have been on the triple-expansion principle, and with boiler steam pressures of at first 130 pounds per square inch, gradually increasing to 155 pounds per square inch in 1887. A

further gain in economy has thus been effected, which is variously estimated. From 15 to 20 per cent. over the compound engine of the same pressure is often given as the amount of gain, and probably 15 per cent. may safely be taken as not too much.

An important development, which may appropriately be mentioned at this point, is the adoption of the double-distillation condenser for obtaining fresh water from sea water. This appliance is the sequel to the surface condenser and an extension of the same principle. As mentioned previously, the surface condenser converted the main body of boiler feed water from salt to fresh water; but it is found that a certain percentage of the water taken from the boiler in the shape of steam is lost during its transit back again to the boiler. In the vast majority of ships this deficit of feed water has to be made up by sea water; the scale from which, at the high temperature of the boiler, is deposited and left in it. A double-distillation condenser of sufficient size will obviate the necessity for this, a quantity of additional fresh water being produced by it without any deposit in the main boilers. It is not possible, however, to fit a condenser which will supply the waste of main engines at high powers, but only for ordinary cruising powers. With the modern marine boiler, however, which has of necessity its internal parts rather cramped for room on account of the limitation of weight, and especially in vessels without an auxiliary boiler, it is found to be really quite inadmissible to distill water for drinking and general ship's purposes direct from the main boilers, on account of the scale necessarily deposited inside, the difficulty of constantly cleaning them and the danger of overheating if not properly cleaned. This objection has caused the adoption of the particular form of distiller mentioned, in which the evaporation takes place in an intermediate vessel between the boiler and fresh-water condenser, and in this intermediate evaporator the scale is deposited, and the arrangements are such that it can be properly cleaned out and dealt with. The generation of steam in the evaporator is caused by the condensation of steam from the main boilers in or around tubes, and this condensed steam is returned to the boilers.

Ford & Moncur Stoves in Great Britain.

From data submitted by Leon & Blair, Pittsburgh agents in this country of the Ford & Moncur hot-blast stoves, they are meeting with much favor in Great Britain, the following list being published of stoves built and in course of construction in that country in May of this year:

Barrow Hematite Steel Works, Barrow-in-Furness.—Seven stoves built and working, viz.: One stove 20-foot diameter by 70 feet high; six stoves 26 feet diameter by 70 feet high.

North Lonsdale Iron Company.—Three stoves built and working, 26 feet diameter by 72 feet high, blowing two furnaces 80 feet high, with 20-foot bosh.

Darwen Iron Company's Works, Darwen, Lancashire.—Three stoves 21 feet diameter by 65 feet high, blowing two furnaces making ferromanganese, 20-foot bosh by 65 feet high each.

Mostyn Iron Works, belonging to Darwen Iron Company.—Three stoves 22 feet diameter by 65 feet high, in course of erection, intended to blow two furnaces making spiegel, 19-foot bosh by 68 feet high each.

Springvale Furnaces, Wolverhampton.—Five stoves, 25 x 65, blowing four furnaces—two 19 x 75 feet and two 18 x 65 feet.

Distington Iron Works, Cumberland.—Two stoves 24 x 60 feet high, two Wardle & Sister stoves altered to Ford & Moncur's patent, adding thereby 90 per cent. to the heating surface, these stoves blowing two large furnaces 70 feet high, making hematite iron.

Chas. Connell & Co., Derwent Works, Workington.—Two stoves 25 x 72, capable of blowing two furnaces; also an additional stove about to be put down at these works.

Maryport Hematite Iron Works, Cumberland.—One stove 26 x 60 and two Cowper stoves altered to Ford & Moncur's patent, 22 x 60 high.

Cleator Moore Iron Works, Cumberland.—Three stoves in course of construction, to blow two large furnaces 75 x 22 foot boshes; stove dimensions, 26 x 72 feet high.

Coltness Iron Works, Lanarkshire, Scotland.—Two stoves 26 x 72, blowing three furnaces making hematite.

Dalmellington Iron Works, Ayrshire, Scotland.—Two stoves 22 x 60 feet built, and two stoves 26 x 72 feet high in course of erection.

Carron Iron Works, Falkirk, Scotland.—One Cowper stove altered to Ford & Moncur's patent.

Harrington Iron Works, Cumberland.—Seven Cowper stoves fitted with Ford & Moncur's system of cleaning by means of compartments fitted with valves and blast pressure.

As to the efficiency of the stoves J. Hamilton, of the Coltness Iron Works, Newmains, Lanarkshire, reports to S. A. Fuller, of the Union Rolling Mill Company, Cleveland, that they are blowing three of their furnaces with two stoves, and that they "can easily register up to 1600° F. when wanted." Other letters from A. W. Hickman, of the Springvale Furnaces, near Wolverhampton; from A. E. Lamb, of the Whitehaven Hematite Iron and Steel Company, Limited, of Cleator Moor, and W. McCowan, of the Distington Hematite Iron Works, near Whitehaven, are similarly favorable in their tenor.

Upon one occasion at the works of the Darwen Iron Company, when they had only two stoves heating the blast for two furnaces, each 20-foot bosh by 65 feet high, an accident occurred which obliged them to lay off one of the stoves, and the other stove was blown for eight hours, and kept the furnaces running until the first could be repaired and heated ready for blast again. The first of these stoves to be erected in this country are now being built by an English company, known as the Talladega Iron and Steel Company, at Talladega, Ala.

An Advance in Coke.—The large coke operators of the Connellsville region, whose headquarters are at Pittsburgh, after holding several consultations regarding the condition of trade, have decided to advance the price of coke. On Thursday, the 25th inst., notices were mailed to the trade by the H. C. Frick Coke Company, the J. M. Schoonmaker Coke Company, the McClure Coke Company, the Connellsville Coke and Iron Company, and J. W. Moore & Co., that on and after November 1, 1888, the price for furnace coke will be \$1.25 per ton; coke for dealers, \$1.35 per ton; and foundry coke, \$1.50 per ton. This is an advance of 25 cents per ton over previous prices. No coke syndicate has been formed, the operators merely pledging themselves to make no new contracts at less than the rate agreed upon. The advance, of course, will not affect existing contracts. At the present time, the coke trade is in a better condition than at any time during the year. The blast furnaces are nearly all in active operation, which causes a corresponding heavy demand for coke. It is believed that the advance will not be objected to in any way by the coke consumers, as the price of pig iron at this time is nearly as high as at this time last year, when coke was selling at \$2 per ton. Freight rates and the prices of ore are also lower. It seems to be the impression that this advance will be followed by another about the first of the new year. The coke workers of the region have been notified that their wages will be advanced 5 per cent., to take effect on November 1, the date on which the advance in the price of coke goes into effect.

Radiator Tube Threading Machine.

A new automatic machine for threading radiator tubes has just been brought out by the Bignall & Keeler Mfg. Company, of St. Louis, Mo. The engraving on this page explains the character of the design. The machine has the advantage of threading both ends at once, cutting right and

and running 12 hours per day at that. A triple chuck machine can be made which will thread about 2000 tubes per day.

Franklin Institute Lectures.—Among those who will lecture before the Franklin Institute, in Philadelphia, during the coming season are: Prof. Louis M. Haupt, on "The Feasibility of Underground Rail-

figures relating to the Mahoning Valley iron interests: "The paid-up capital and surplus employed in the Mahoning Valley is \$4,583,800, an average of \$270,000 for each manufacturing plant. For the year ending June 30, 1888, the value of the product was \$13,607,794.70. This immense output required the services of 5048 men. There were paid out for wages \$3,016,245.36, or more than \$600 per annum income for each person, which includes boys and very many common laborers of small earning capacity."

Treasury Decisions.

Wire mattresses, notwithstanding the fact that they accompany bedsteads, do not come within the scope of the provision in Schedule D (T. I., 230) for "house furniture," but are dutiable at the rate of 45 per cent. ad valorem, under the provision in Schedule C (T. I., 216): *Provided, however,* That such rate is equal to or greater than the rate fixed by paragraph 182 for iron wire of the size of which the mattresses are manufactured.

Short pieces of brass curb chain, although they may be intended to be completed for use as watch-chains, cannot, in their present condition, be regarded as watch-chains, and, accordingly, are held to be dutiable at the rate of 45 per cent. ad valorem as unenumerated manufactures of metal, under the provisions of Schedule C (T. I., 216).

Razors with blades of regular patterns, and with finished handles, are held to be dutiable at the rate of 50 per cent. ad valorem, under the special provision in Schedule C (T. I., 207) for "razors," notwithstanding the fact that the blades are not ground and polished.

Silver-plated hooks, bars and swivels, intended for use in the manufacture of watch-chains, but which may be used for various other purposes, cannot be considered as coming within the scope of the provision in Schedule N (T. I., 459) for "jewelry of all kinds," but are held to be dutiable at the rate of 35 per cent. ad valorem, under the provision in Schedule C (T. I., 210) for "plated * * * articles."

Tin Nails.—We were recently shown a number of nails made from tin plate and sheet-brass scrap by a machine built by the Ferracute Machine Company, of Bridgeton, N. J., and which, at present, is being further improved upon. The nails are punched up from suitably cut blanks, and can be used for all purposes to which the ordinary forms of nails are adapted. They drive well in hard wood, and in point of cost will, no doubt, offer additional inducements. Both the nails and the machine by which they are made are of great interest, and we shall have occasion to again refer to them more at length. Mr. Oberlin Smith, the president of the Ferracute Company, is giving his personal attention to the work of perfecting the machinery.

The through rates from Baltimore to St. Paul and Minneapolis over the C., B. & Q. are: First-class, \$1.02; second, 91 cents; third, 74; fourth, 48; fifth, 41; sixth, 33; iron less than carloads, 38 cents; in carloads, 30 cents. These have been made the maximum rates, and will apply to all intermediate points, except when the through rate is less local rates will be charged.

Announcement is made that the Mann Boudoir and Woodruff Sleeping Car Companies have consolidated under the title of the Union Palace Car Company, with a capital stock of \$3,000,000.

AUTOMATIC RADIATOR TUBE THREADING MACHINE, BUILT BY THE BIGNALL & KEELER MFG. COMPANY, ST. LOUIS, MO.

left-hand threads. The tubes are first cut off in another machine to exact lengths and then threaded, the machine will thread tubes from 12 to 48 inches in length inclusive. It is automatic in its operation and can be run for hours without stopping. It has an automatic oiling device which keeps the dies constantly flooded with oil. The double head or single machine it is claimed will easily thread 600 tubes a day of 10 hours. The Kansas City Radiator and Iron Foundry Company are threading 70 tubes per hour,

roads in Philadelphia," on November 5; John Birkinbine, on "Pig Iron," on November 26; W. M. Barr, on "Interchangeable Work," on January 14; R. W. Hunt, on "The Manufacture of Steel Rails," on January 21; Dr. C. B. Dudley, on "Bearing Metal Alloys," on February 4, and Andrew Carnegie, on "Industries of Pennsylvania," on March 18.

In the course of a speech Mr. J. G. Butler, Jr., of the Brier Hill Coal and Iron Company, gave the following interesting

THE WEEK.

The manufacture of cotton in the South gains in importance from year to year. The Southern Atlantic States, with a production of about 1,750,000 bales, consumed last season 343,042, or one-fifth their production, in their own mills. This is certainly a good showing for an industry originating almost wholly since the war. It is gradually extending from that section to the Southwest, where the bulk of the crop is now produced.

The National Board of Steam Navigation elected officers for the ensuing year, as follows: President, A. C. Cheney, New York City; first vice-president, B. D. Wood, New Orleans; second vice-president, F. A. Churchman, Philadelphia; treasurer, Addison Lysle, Pittsburgh, Pa.; secretary, J. W. Bryant, New Orleans; assistant secretary, Charles H. Boyer, New York City; executive committee, James S. Negley and W. W. O'Neil, of Pittsburgh, Pa.; J. B. Coyle, of Portland, Me.; J. W. Miller, of Providence, R. I.; D. M. Munger, F. W. Vosburgh, H. F. Dimock, H. A. Bourne, I. L. Fisher, C. W. Woolsey and M. E. Staples, of New York City; G. W. Pride, Sr., of Philadelphia; A. M. Halliday, of Cincinnati; H. C. Hoarstick, of St. Louis, and C. P. Truslow, of New Orleans. A resolution was adopted that the next annual meeting be held at Pittsburgh, Pa., on the first Tuesday in October, 1889.

The sundry civil bill provides for the expenditure of only \$4,000,000 on the new Congressional library building, and the chief of engineers in charge says the limit fixed by law will be adhered to, as the structure will cover less space than was originally intended.

The Brotherhood of Railroad Brakemen has a membership of 14,000.

The Manchester *Examiner* says that although £3,000,000 was the authorized capital for the combination of British salt mining interests, about twelve times that amount was subscribed before the subscription lists closed.

Thomas Axworthy, the trusted treasurer of the city of Cleveland, is one more added to the list of defaulters. The deficit is not far from \$500,000, and an amount equal to this sum he is believed to have lost in the "Old Hutch" wheat deal. It is also reported that he lost heavily in the Gogebic iron mining venture, and he was caught in the same wheat corner in Chicago that brought Harper to grief.

Two barks in Philadelphia are loading with locomotives for lines of railway in Brazil and the Argentine Republic, all of which were built by English capitalists, but are equipped with American engines. The first-class cars for the same railways are manufactured in Wilmington, Del.

William H. Walbaum, senior member of the firm of Walbaum & Co., iron brokers in Philadelphia, was killed by falling from the cars on the Pennsylvania Railroad near Menlo Park. He was born in England, and was about 38 years old.

The heavy losses recently sustained by builders in New York, as the consequence of an overloaded market, have led to the adoption of a new device for mutual protection. The builders have commenced forming companies, composed of the builders themselves and their mortgage holders, for the purpose of carrying the imperiled property and preventing its sacrifice by foreclosure or forced sale. So far as this scheme has been tried it works well. It is essentially a scheme for co-operation, and it is consistent with methods that seem to be growing in favor with business men in all departments of the market. It is not

precisely a trust, since only the persons compromised in the transactions of a single building firm are made partners in the combination; but it will serve some of the ends of a trust if it can remove the danger of immediate foreclosure, and help to tide over the time while builders are waiting for the return of a normal market.

The late John Wentworth, of Chicago, left real estate valued at \$1,125,000; also \$375,000 in personal property.

A legal contest has arisen among the heirs of the late John Roach, iron steamship builder, respecting the distribution of property under the will. The plaintiff alleges that William Henry Roach, having been especially trained and educated for the purpose, was in 1864 taken into partnership by his father, the firm becoming John Roach & Son. Upon William Henry's accession to the firm the business began to prosper, and at the time of his death in 1872 it was worth \$1,500,000. This growth was due, it is alleged, to the efforts of William Henry Roach. When William Henry died his father continued the business under the same firm name, but made no accounting to the widow of William Henry of her husband's share in the business. The petition sets forth that the deceased husband was entitled to one-half interest in the property remaining.

A German syndicate, in which strong banking interests are represented, are said to have obtained from the Venezuelan Government a concession for a railway from Caracas to the sugar and coffee plantations in the interior. Like the scheme for the encouragement of French colonization, the ultimate object, we surmise, is to check English encroachments on disputed territory.

Captain J. W. Miller, manager of the Stonington Steamboat Company, read a paper before the National Board of Steam Navigation on the Nicaragua Canal as a means of extending and developing the coasting trade of the United States. The carrying capacity of every ship that now goes around Cape Horn will be doubled by the canal, as she will make two trips through the canal to one around the cape. Our coasting vessels, which now stop at the line of Texas on the East and Lower California on the West, will then trade from Maine to Alaska. The region covered by the local shipping interests of the United States is already greater than that controlled by any foreign nation, but the separation of our Eastern and Western coasts has tended to develop railway transportation, while the ocean-carrying trade has been gradually engrossed by foreign ships. The Nicaragua Canal will give us control of traffic over a coast line of 8000 miles, in which there can be no foreign competition.

An excursion to Mexico is proposed by the New Orleans Chamber of Commerce, in hopes of causing a diversion of trade from the European steamship lines terminating at Vera Cruz, but Mexican journalists do not speak hopefully of the scheme.

The records of the transactions of Congress during the session just closed show that the whole number of bills and joint resolutions passed was 1443, of which 1197 were approved by the president; 95 became laws without signature, 128 were vetoed and 23 failed for want of signatures at the time of adjournment. The enactments of a commercial nature comprised a bill for an international marine conference to promote safety at sea; a bill providing for a congress of representatives of American nations to discuss plans for commercial union, trade relations, &c.; bills to define the permissible marks on mail matter; establishing a Department of Labor; to carry out the treaty for protection of submarine cables; compel the

maintenance of Pacific railroad telegraph lines; to define the meaning of obscure provisions of our tonnage laws, and abolishing fees for the official inspection of steam vessels.

The will of the late Samuel J. Tilden, providing for the establishment of a public library, is sustained by Judge Lawrence, of the Supreme Court. The amount involved is said to be about \$10,000,000. An appeal will be taken.

The Coroner's jury in the case of the "Mud Run horror," on the Lehigh Valley Railroad, find the engineers and conductors alike guilty in failing to observe the usual precautions against a collision of trains.

Members of the New York Produce Exchange are endeavoring to carry into execution a plan for circulating the daily market quotations throughout the country. The plan, in brief, is to establish telegraphic connections with Chicago, Toledo, Detroit, Buffalo, Toronto, Cincinnati, Montreal, St. Paul, Minneapolis and Duluth upon a basis of a division of expenses with each of the above-named markets. Estimates are being secured, and it is thought that an annual expenditure in the aggregate of \$50,000 will accomplish the desired result. Of this amount, \$25,000 would fall to the share of the New York Exchange.

The complaint that the insulation of the electric wires placed in the subways has in some instances been destroyed by the escape of steam from the Steam Heating Company's pipes appears to have been well founded, but the engineers employed profess to believe that this difficulty can be remedied. A manufacturer of cables claims that cables can be made which will stand a test of 200° heat.

"Training for Trades" was the subject of a lecture delivered last week by John J. Tucker, of the Aqueduct Commission. He pointed out the manner in which young men had been drifting into clerkships and deserting the mechanical trades. Two reasons were assigned for this—the idea that a mechanical trade lowers the social standard and the abandonment of the apprentice system. The remedy he suggested was the establishment of technical or trades schools in connection with the city educational institutions. Such schools would elevate the mechanical trades. All the trades could be taught in one school, and a trade could be learned in one-third the time it now takes.

The Atlantic and Union dredging companies, of Brooklyn, and contractor Thomas Potter, of Jersey City, have formed a partnership to build a storage basin in New York Bay, at Bayonne.

The newspaper press of Mexico, like that of the Argentine Republic, is fruitful in schemes designed to attract immigration, but the general disposition is to invite Europeans rather than North Americans, respecting whom it is said there is "in some journals a marked dread of a possible preponderance of American influence."

Admiral D. D. Porter has made his annual report to the Secretary of the Navy. He says he regards sailing vessels as the best practice ships afloat, and that, while a couple of steamers might well be employed as gunnery ships, the Portsmouth, Jamestown and Saratoga should be retained in the navy for the purpose of giving the apprentice boys an extended voyage to sea. On the subject of torpedoes the Admiral says that for years he has doubted the efficiency of the Whitehead and other fish torpedoes, and he adds: "The torpedo, no doubt, can be made a powerful adjunct to other naval appliances, but, as matters now stand, the Mobile torpedo

would be comparatively useless against heavily armored ships with power guns, which would hold their own, notwithstanding they might be hampered with nets enough to keep out a whale torpedo. Ships might have to pause for a while before torpedoes planted on the bottom, but the stoppage would only be temporary, enabling the inhabitants of seaboard cities to move inland with their portable effects. Great ships with great guns will command the situation, and, having once effected an entrance into the harbor, can, by aid of the electric lights, send a party of divers to the bottom and cut the wires connecting submerged mines. These are at present the only torpedoes to be feared as very dangerous, and these become less formidable after having remained for some time under water. Our country more than any other stands in need of torpedo vessels of from 1600 to 2600 tons displacement until we can get our new navy fairly started. This class of vessels could be built much more rapidly than the cruiser or armorclad, their batteries to be not larger than 6 inch rifles and fitted with machine and rapid-firing guns. Hulls on the plan of the Polyphemus would be good ones with which to begin."

An industrial school for the training of boys is proposed by I. V. Williamson, a wealthy citizen of Philadelphia, which will rank in extent and educational importance with the great charity founded by Stephen Girard. Mr. Williamson has named a board of trustees to which will be intrusted the consummation of his plans, and is now engaged in the task of adjusting his securities so that his endowment will be of a permanent character. It is expected that the announcement of the intended gift will be made before the end of the year.

Augusta, Ga., is among the most prosperous of Southern cities. Trade has grown to a volume of \$68,000,000, an increase of \$9,000,000 in the past year. New river steamers have lowered rates to the coast one-third on cotton and produce, placing the city in a great measure independent of railroad consolidations. The building improvements the past year have reached \$1,500,000, and the tax digest for 1888 shows a total of \$20,000,000, an increase of \$4,000,000. The Augusta National Exposition opens November 8.

A corporation called the Massachusetts Dredging Company has been formed by New York and Boston capitalists for the purpose of dredging the Charles River and reclaiming the adjacent Cambridge marshes. The machine to be used was invented by a Russian named Alexey von Schmidt, who now lives in California. It not only dredges the channel of the river or harbor, but deposits the material on the shore by hydraulic pressure through iron pipes laid overland or across pontoons, and thus may be made to reclaim land a mile away.

The city of Chicago, otherwise known as the Lake City, if its population continues to increase as at present, will soon contain as many people as all the rest of the State. Including its suburbs, Chicago now represents one-fourth the population of Illinois, and, it is estimated, will cast 180,000 votes at the coming election, as compared with 570,000 in the rural counties.

Clausen's brewing establishment in this city was sold to an English syndicate for \$4,500,000.

The Governor of Utah reports an increase of only about 60,000 souls in that Territory since 1880. The manufacturing industries of the Territory are said to be in a satisfactory condition, and, taken as a whole, the year has been a prosperous

one. The aggregate mineral product of the Territory for the calendar year 1887 is given as \$7,637,729, of which \$5,976,884 was silver.

It is said that the total cost of the improvements making this year on the Pennsylvania Railroad will be near \$2,000,000, a large part of the expenditure being for third and fourth tracks and steel rails.

A grand scheme to promote immigration from Europe to the Southern States is being promoted by agents of the principal lines of Southern railroads, who held a meeting in Louisville a few days ago, with this object. It is proposed that the West India and Pacific Steamship Line, running from Liverpool, shall, like the big lines to New York, carry emigrants, landing them in New Orleans, to be distributed by the several railroad companies to whatever part of the South, West or Pacific slope they may desire to go. The expectation is that a considerable share of the trade may be diverted from Castle Garden.

The keel of the naval vessel Maine was laid unostentatiously at the Brooklyn Navy Yard on Thursday. She will be the largest and most powerful vessel yet undertaken for our navy. She will have a length between perpendiculars of 310 feet, an extreme breadth of 57 and a mean draft of 21½, with a displacement of 6648 tons. Her engines will have an aggregate of 8750 horse-power, which should give her a speed of 17 knots. Her armor belt will be 11 inches thick and her turret and breastwork only ½ inch less. Her main battery will consist of four 10-inch and six 6-inch breech-loading guns, the former being in turrets; and, as these are placed *en échelon*, the whole four can be fixed directly ahead or directly astern.

At the Texas State Fair may be seen one of the spades used by the Pueblo Indians in cutting the irrigation ditches at Ysleta, Tex., in 1540.

"Uncle" Rufus Hatch expressed himself on 'Change in reference to the big wheat deal and the manner in which foreigners engage in transactions of this character. While in Chicago last week he said: "Seven-eighths of the loss was by foreigners, through their New York correspondents. The foreigners have been domineering our wheat market for three or four years, and I am glad to see them get the worst of it. The speculation in Berlin, Vienna and Liverpool has been immense. The regular importers of wheat have been gambling in American markets and making enough to pay the freight on their importations. The method was to buy cargoes of wheat in Australia or India and then sell for future delivery in Chicago. They would make 2 and 2½ per cent. a month and come out with enough to pay the freight on their cargoes. They were always short and had a notion that the wheat crop in America was illimitable. The Almighty sent a frost a little earlier this season and the foreigners were nipped. They don't understand it, and lots of them are short now. They will find it out in six months."

All measures designed to exterminate those powerful monopolies known as trusts, or at least to counteract their evil effects, are left in abeyance until after the election. Respecting the future one of our commercial contemporaries remarks: "In the quieter and more rational period, which we hope will follow the election, men of both parties in Congress, yielding to the demands of their wronged and indignant constituents, ought to join in finding out constitutional and effective ways of rendering powerless the copper trust, the sugar trust and the rest of the monstrous brood. And in this excellent work may we not

count upon the assistance of legislatures in passing stringent laws, if required, to meet the emergency, and also upon prosecuting attorneys to enforce existing laws against those illegal combinations, which are only old offenders now robbing the public under the alias of trusts? There is really no reason why officials of all parties, being safely installed in their seats at Washington or at the State capitals, should not unite in a grand hunt for the extermination of trusts."

The tow-boat business of New York harbor represents an investment of several million dollars. To build a tug costs all the way from \$12,000 to \$50,000. From figures furnished by the local inspectors of steam vessels, whose duty it is to keep track of tugs as well as of all other steamboats, it would seem that there are now employed in the river and harbor something like 300 tugs. Estimating that the cost of building these tugs is, on an average, \$15,000, it will be seen that the money sunk in their construction foots up in round figures the enormous amount of \$4,500,000. And that, tow-boatmen say, falls far short of the mark. Fully 80 per cent. of the business is controlled by corporations. Most of the great railroad lines, for instance, do their own towing and own their own tugs.

The great manufacturing city of New ark shows an enrollment of 37,932 on the registry lists, against 32,270 in Jersey City, which is given by the census a larger population.

M. de Tchihatchef, a writer in one of the French newspapers, asserts that the average flow of petroleum in the Baku region is 88,000 barrels per day, as against 25,300 in the United States. The chief drawbacks encountered by those who have worked the Baku oil fields have been lack of transportation, absence of fuel and want of cheap packages. A railroad built across to Batoum, on the Black Sea, opened two maritime routes to Europe and met the first difficulty; cars and vessels constructed to carry crude oil met the last, and enabled the refineries to be built in the interior of the empire wherever fuel might be cheapest. It is confidently predicted, since the completion of the Batoum railroad, that Russian oil will displace American in the European markets, and that it will even be possible for the Russian product to compete for the markets of the United States. M. de Tchihatchef points out a probable demand in the near future for petroleum to serve as fuel on the great lines of railway completed and still building in Asia. He sums up the case, as made up by him, with the words: "It must be admitted that the enormous advantages which Russia possesses over the United States must necessarily lead one day to a complete victory over her present powerful rival."

Work has commenced on a great overflow dam in Paradise Cut, 15 miles south of Stockton, in the San Joaquin River, California. The dam will be 250 feet long and 40 feet high, and will be made of timber, with earth filling. The intention is to keep the strong current of the San Joaquin in the main river channel, thus scouring it out and aiding navigation.

The iron steamship Atlas, built in 1873, at Dumbarton, Scotland, and which had just arrived from Costa Rica with a cargo of coffee, logwood and bananas, was run into last week by the ferry-boat Central, off the foot of Barclay street, in this city, and sunk in five minutes. The ferry-boat penetrated about 10 feet, the iron plates seeming to offer little resistance. The steamer was valued at \$100,000 and the cargo about \$45,000.

MANUFACTURING.

Iron and Steel.

The nail factory of the Belmont Nail Company, at Wheeling, W. Va., is in full operation, with the exception of the small nail machines, which are idle for an indefinite period. The report that a strike had taken place at this mill is without foundation. The Belmont, like several other nail mills and tack factories in the country, desired to place itself in a position where it could compete in the market on small nails. This cannot be done unless a single feeder runs eight machines, as in tack factories, instead of four, as in nail mills. No reduction in price was demanded. The small machines, at the Belmont are located in an annex, separate and apart from the other machines but under the same roof. A proposition was made to the men who run these small machines that they be run hereafter on the tack factory basis. At first they consented, but afterward reconsidered the matter and declined for the present, when the machines were closed down, and will remain closed until such time as the men can agree that they may be run upon a basis that has been adopted by other mills and which will enable the company to meet a fair business competition.

Fannie Furnace, at West Middlesex, Pa., operated under lease by the Wheeler Furnace Company, of Sharon, Pa., is 60 feet high, 12 feet 2 inches at the bosh, and 8 feet at the tuyeres. The furnace was blown in last May, and has been running along at the rate of 80 to 90 per day, but for the last two weeks has averaged over 100 tons per day. For two days in succession it produced 106 tons. Ore yields 58.4 per cent., while 2031 pounds of coke is used to each ton of iron made. The furnace is equipped with iron stoves and a 72-inch blowing engine, made by Macintosh, Hemphill & Co., of Pittsburgh. There is also another small engine which is seldom used. The furnace is at present running on Bessemer, and since August 17th all the iron produced has been strictly No. 1, with the exception of one cast.

Northampton Furnace, near Freemansburg, Pa., operated by the Bethlehem Iron Company, of Bethlehem, Pa., was blown out on Monday, the 20th ult., and will remain idle until spring. In the meantime the furnace will be thoroughly overhauled and improved.

The Apollo Iron and Steel Company, of Pittsburgh, are operating their plant at Apollo, Pa., to its utmost capacity. The steel department is being operated double- turn, while the galvanizing department, which is the largest in the United States, has not been closed down for any length of time since it was built, over two years ago. Six pots are now in operation.

Moorhead, Brother & Co., of Pittsburgh, proprietors of the Vesuvius Iron and Nail Works, at Sharpsburg, Pa., are using coal gas made by a new process, which enables them to furnish fuel for a ton of iron at a cost of a little over \$1 for heating and puddling. A heating furnace in operation for several weeks has shown the cost in the heating process to be less than 60 cents per ton. Two new double puddling furnaces, which are to be furnished with fuel made under the same process, are about ready to be lighted. The new method will effect a saving of almost \$4 in making 10,000 pounds of muck bar in a quadruple puddling furnace, and nearly half as much in a double puddling furnace.

The Moorehead-McCleane Company, proprietors of the Soho Iron and Steel Works, at Pittsburgh, have contracted with the Lewis Foundry and Machine Company,

Limited, of that city, for the erection of a 16-inch skelp mill, which will enable the firm to make all sizes of skelp iron such as are made in grooves. Heretofore they have made some sizes on plate mills for the Pittsburgh Tube Company, in which the firm are interested. The completion of the new mill will enable them to manufacture all sizes required.

The Mahoning Valley Iron Company, of Youngstown, Ohio, are making a number of improvements which will increase their output considerably. The company are at present rebuilding their blast furnace, and have also built a new engine-house and pattern shop and placed several new boilers in the rolling mill.

Week before last Phoenix Furnace, owned and operated by Brown, Bonnell & Co., of Youngstown, Ohio, produced 804 tons of pig iron, which is the largest production in that length of time in the history of the furnace.

The Iron City Mfg. Company is the name of a new organization that has succeeded to the business of Geo. Y. McMurtry, manufacturer of hot-pressed nuts, at Pittsburgh, Mr. McMurtry having disposed of his entire interest in the business. Robert J. Taggart is secretary and treasurer of the new firm.

From a recent issue of the Franklin (Pa.) *News* we take the following: "An idea of the advantage of having industries in a town may be formed by a glance at the total amounts now paid out each month in New Castle, Pa. Some of the pay sheets are as follows: Johnston's Sheet Mill, \$20,000; Etna Iron Works, \$20,000; Witherow's Works, \$12,000; New Castle Wire Nail Works, \$10,000; Crawford Iron and Steel Company, \$6000; Oliver Bros. & Phillips, \$5000; Baldwin & Graham's Stove Works, \$4800; Etna Furnace, \$4000; Raney & Berger Furnace, \$4000; New Castle Paper Mill, \$1000; total, \$86,000."

From a recent issue of the Sharpsville (Pa.) *Times* we take the following information relating to the blast furnaces in the Shenango Valley: "Mabel Furnace has been making a phenomenal output of iron lately, and can lay claim to having the best record of any furnace in the valley. This furnace is making on average 120 tons of Bessemer iron a day, with a maximum daily output of 130, the latter amount having been made last Monday. This for a 65-foot stack will be hard to beat. The Claire Furnace is also making a large amount of iron, her best day's output being 147 tons of Bessemer. This furnace has a record of 896 tons per week. The Sharpsville Furnace, which was blown out some time ago, is undergoing extensive repairs which will largely increase the output of iron when it is again put in blast. The old bosh has been torn out, the salamander taken out and a new bosh is being put in. A new hot blast, of Pierce patent, is being built, and other improvements made which will take some time to complete.

The National Tube Works Company, of McKeesport, Pa., have commenced the erection of a new puddling department, to contain 20 puddling furnaces.

The Lehigh Iron Company, of Allentown, Pa., have recently blown in No. 1 furnace, which has been undergoing repairs.

The entire machinery for the new plant of the Roanoke Rolling Mill Company, at Roanoke, Va., has been almost completed by Wharton McKnight, proprietor of the Anchor Foundry, at Pittsburgh. The works have for some time been running full night turn, in order to complete the order in time to allow the new rolling mill at Roanoke to start up on January 1. Four engines, an 18-inch muck train, a

16-inch bar mill, a 10-inch guide mill, squeezers, shears and hot saws, all of which will be run by separate engines, have been already completed.

The Allentown Iron Company, of Allentown, Pa., last week blew in an additional furnace.

In our issue of September 18, last, we made mention of the fact that the plant of the Wheatland Iron Company, at Wheatland, Pa., owned by the Woods heirs, of Pittsburgh, and which has been idle for more than ten years, would resume operations in a short time. Last week a partial resumption of the plant took place, and it is expected that in a short time all departments will be in full operation. Skelp iron of large sizes will be the principal product, of which the plant will have a capacity of about 300 tons every 24 hours.

A report was published in the Pittsburgh papers last week, to the effect that Singer, Nimick & Co., Limited, steel manufacturers, of that city, had decided to make a reduction in wages. We find, upon investigation, that the report is untrue. This firm have refused to recognize either the Amalgamated Association or the Knights of Labor, but the men are employed with the understanding that the firm will always pay as high a rate of wages as any union mill in that city.

The Lloyd-Booth Company, proprietors of the Falcon Foundry and Machine Works, at Youngstown, Ohio, have just completed for the Warren Iron and Steel Company, of Warren, Ohio, a heavy scrap shear to cut up to 5-inch round iron cold. The shear is of a new pattern and modern design.

We are informed that the report that the supply of natural gas had been cut off from the mills of Brown, Bonnell & Co., of Youngstown, Ohio, is without foundation. The entire plant of this firm, with the exception of the nail factory, is being operated to its utmost capacity.

Some months ago McClure & Schuler, engineers and contractors, of Pittsburgh, fitted up No. 1 Furnace of Shoenberger, Speer & Co., of that city, with three Massicks & Crooke's hot-blast stoves. Since these have been in operation they have given entire satisfaction, and a few days ago the firm received a contract for three additional stoves of the same design to be placed in No. 2 Furnace. Work on these will be commenced early during the next month.

Edith Furnace, of the Edith Furnace Company, at Allegheny City, Pa., which has been out of blast since June 16 last for relining and repairs, resumed operations on Wednesday, the 24th ult. This furnace is operated under lease by the National Tube Works Company, of McKeesport, Pa., and its entire product, amounting to about 700 tons per week, is consumed by that firm.

A company is now being formed, and all the stock, \$250,000, is already subscribed, for building a 150-ton coke furnace at Toledo, Ohio. It will be a complete modern plant, costing, perhaps, \$200,000. Its product will be foundry and forge iron made from Lake Superior ores with Connelville coke. It is backed by Cincinnati and Southern Ohio and Toledo capitalists. All of the parties actively interested are experienced and successful iron men. It is expected that work of construction will be begun at an early date.

The charcoal iron furnace of the Appleton Furnace Company, at Appleton, Wis., was burned on the 28th ult.

Messrs. Matthew Addy & Co., of Cincinnati, inform the *Bulletin* of the Iron

and Steel Association that Pioneer Furnace, at Thomas, near Birmingham, Ala., of which they are the agents, made during the week ending October 6 787 gross tons of pig iron, 89 per cent. of which was foundry iron. This is an increase of 37 tons over the highest previous weekly make. Since the furnace was put in blast last May it has made less than 1000 tons of forge iron.

Machinery.

The Stearns Mfg. Company, of Erie, Pa., are still adding to their boiler and engine works, which now cover an area of 6 acres. They commenced business in 1887, and have since that time built and equipped: 1. Machine shop, 80 x 300 feet, with floor space of 39,000 feet, provided with a splendid 15-ton crane, which commands the whole length of the building. 2. Smith shop and boiler rooms, 50 x 147 feet, with 7350 feet floor space. 3. Boiler works, 80 x 200 feet, with floor space of 16,000 feet. 4. Foundry, 85 x 200 feet, floor space 17,000 feet. 5. Carpenter shops and storage rooms to balance of territory. The buildings are all especially adapted to their uses, and, altogether, make one of the most valuable and sightly plants in the country. They employ 450 hands, and are taxed to the utmost to meet their orders.

The Hyde Iron Works, of Bath, Me., formerly known as the New England Marine Engine and Machine Works, have resumed operations. Only a few men are employed, but it is probable that a full force will be engaged soon. These works will be run in connection with the Bath Iron Works.

Last week the Westinghouse Electric Company, of Pittsburgh, concluded the establishment of two electric light plants, numbering together 1100 16 candle-power incandescent lights. One of these plants is at Tyler, Tex., with 650 lights, and the other at Clinton, Ill., with the same number.

H. K. Porter & Co., of Pittsburgh, builders of light locomotives, have received an order from the Japanese Government for two Mogul 42-inch gauge locomotives to be used on the Paranai Railroad in the island of Yesso. This line is of the narrow gauge standard adopted by English engineers for India and some of their other colonies. H. K. Porter & Co. are the first locomotive builders in the United States who ever sent an engine to Asia. Formerly English manufacturers had the exclusive trade, although later on some French locomotives were sent there. Their first consignment was in 1880 for two locomotives; the second, May, 1881, for two locomotives also; the third, May, 1884, one locomotive; the fourth, January, 1885, two locomotives. The present order will be completed by February, 1889, and shipped.

The Indiana Machine Works have been incorporated at Fort Wayne, Ind., with a capital stock of \$75,000. J. C. Peters and others are the incorporators.

The Grant Locomotive Works, of Paterson, N. J., are considering the subject of moving to some Western point "for business reasons"; but W. W. Grant, when questioned on the subject, was not disposed to speak more specifically about it just now. Minneapolis, as well as Chicago, claims to offer superior advantages as a new location.

The Williams & Orton Mfg. Company, of Sterling, Ill., have opened an office at 152 Lake street, Chicago, for the sale of the Charter gas engines. These engines were awarded the medal of superiority by the American Institute, New York, in 1886. They are suitable for running passenger and freight elevators, printers'

machinery, pumps, saws, lathes, sewing machines, fans, coffee and spice mills, and for other service requiring from 2 to 25 horse-power. The company have issued an illustrated circular describing the engine and giving a large number of testimonials respecting its efficiency and economy.

The Hughes Steam Pump Company, of Cleveland, Ohio, report an active business in their line of manufactures. They have recently made extensive additions to their establishment and are now running a largely increased force of men night and day.

Mr. A. Mugford, of Hartford, Conn., who is no doubt well known to many of our readers as a wood engraver and printer, has just issued a new copy of his catalogue, which he calls "The Manufacturers' Exchange," and which contains specimen impressions of wood cuts recently turned out by him for different manufacturers. The engravings are, without exception, well executed and readily commend themselves to manufacturers.

At the Centennial Exposition of the Ohio Valley, in Cincinnati, the Waterhouse Electric and Manufacturing Company, of Hartford, Conn., were awarded a gold medal and two silver medals on their arc light plant exhibited. The company are to be congratulated on receiving their second gold medal, the first having been awarded at the Mechanics' Fair, Boston, in December last.

The Egan Company, of Cincinnati, Ohio, are at present building a large line of special machines for finishing and polishing wood surfaces, notably sand-papering machines, which, we understand, are ingenious and simple in construction. It is of some interest to note here, also, that at the Cincinnati Centennial Exhibition the company received medals of superiority on all the machines which they had entered for competition—namely, their No. 4 planer and smoother, dove-tailer, slot tenoner, wood-worker and molder, combined band and scroll saws, shapers, &c.

The Ball Electric Light Company, of New York, report recent sales amounting to 1095 arc lights.

Hardware.

Articles of incorporation were filed in the recorder's office in Kansas City, Mo., October 8, by the Western Electric Lock Company, with a capital stock of \$100,000. The purposes for which the corporation are formed are to manufacture, sell and deal in the Gill electric combination lock in all its various applications in connection with railroads, telegraphs, telephones, military and naval purposes, police and fire departments. The company will also deal in all other electrical contrivances of this character. The incorporators are Benjamin F. Jones, Edward L. Martin and Alfred W. Jones.

From a recent issue of the Reading (Pa.) *Times* we take the following account of the works of the Reading Hardware Company, which were destroyed by fire some time since:

The work of rebuilding the Reading Hardware Works is steadily going ahead, though not so rapidly as it would were the weather more favorable for building operations. Every precaution that time, skill and money have been able to secure in the way of putting up an entirely safe and thoroughly fire-proof structure is being employed. With this in view the enterprising management is availing itself of every valuable architectural improvement known in the construction of large industrial establishments. The isolation of some of the buildings heretofore connected; the absence of joists, which present so much surface for combustion; the introduction of iron doors and shutters; the connecting of the different buildings by means of iron bridges, together with other devices for preventing the spread of fire, are among the improvements contemplated.

The present necessarily limited capacity of the works is taxed to the utmost in the production of goods for the trade. In addition to this the Manhattan Works leased by them, and employing some 300 hands, is turning out work as fast as possible. Large heaps of burnt castings, running into tons, are still on the premises as terrible reminders of the severity of the conflagration which laid in ashes one of the largest and most prosperous industrial establishments in the country. With favorable weather the works will soon be rebuilt. When that shall have been accomplished, and with the introduction of the latest improved machinery to equip the factory to meet all its varied needs, we may confidently look upon the new Reading Hardware Works as an institution in which every citizen will feel a just pride.

The American Wire Nail Company, Covington, Ky., will break ground at once for an extensive wire nail manufacturing plant, including a rod and wire mill, at Anderson, Ind. The new works will be situated within easy access to four lines of railroad, the C. C. C. and I., C. W. and M., Pittsburgh, C. and St. L. and the Midland. The site consists of 10 acres of land, upon which will be erected six large structures, consisting of wire mill, 85 x 285 feet, with which is connected a nail mill, 100 x 200 feet; rod mill, 100 x 260 feet; boiler house, 40 x 80 feet; machine shop, 50 x 100 feet, and carpenter shop, 50 x 100 feet. The machinery for the rod mill will be built by the Lewis Foundry and Machine Company, Pittsburgh, having a capacity of 100 tons per day. The wire machinery is to be built by M. Darragh, Fallston, Pa., having a capacity of 75 tons daily. Motive-power will be furnished by a 2000 horse-power poppet valve engine, made by H. Frisbie & Co., Cincinnati, the cylinder of which measures 48 x 60 inches, with band wheels, having each a 38-inch face and 22 feet in diameter, the combined weight of which will be 50 tons. The wire and rod mill building will be advanced as rapidly as possible, while work on the nail mill will be commenced early in the spring. The latter is to have a complement of 50 machines, which number will be added to as necessity requires. The entire plant will be completed about March 1, 1889, when 300 men will be given employment. The entire works will be illuminated with electric light. Fuel being one of the larger items entering into the cost of manufacturing wire nails, has urged the selection of Anderson for the location of the new plant. A natural gas well with 325 pounds pressure is now flowing on the property, which was donated to them by the city in addition to a generous bonus, while the new location is more centrally located to their trade in the North, West and Northwest, which territory is to be supplied from that point. The works at Covington will continue in operation to supply the local and Southern trade principally. The capital of the company has been largely increased by the admission of Messrs. Garvey Bros., of Covington, Ky. This will involve no change in the active management of the business affairs of the concern, Mr. L. H. Gedge occupying the position of president; Mr. E. J. Buffington, treasurer, and B. H. Gedge, vice-president and secretary.

The Whitney Gun Company, of Northampton, Mass., have most of their tools made and are now engaged on several guns that will be used as samples, and after their introduction the general manufacture of the arms will be begun.

At a meeting of the stockholders of the Bryden Horse Shoe Company, Limited, of Catasauqua, Pa., held in that place on Thursday, the 25th ult., it was decided to increase the stock of the corporation. It is intended to erect new works and enlarge the plant considerably. The new works will be in operation about the 1st of December next.

The Iron Age

New York, Thursday, November 1, 1888.

DAVID WILLIAMS, - - - PUBLISHER AND PROPRIETOR.
CHAS. KIRCHHOFF, JR., - - EDITOR.
GEO. W. COPE, - - - ASSOCIATE EDITOR, CHICAGO
RICHARD R. WILLIAMS, - - - HARDWARE EDITOR.
JOHN S. KING, - - - BUSINESS MANAGER.

The growing importance of the interests of *The Iron Age* in St. Louis and in the flourishing territory tributary to it has led us to open a branch office in the Commercial Building, 212 North Sixth street, St. Louis. Mr. H. H. Roberts, who has assumed charge, is long and favorably known to many of the friends of *The Iron Age* in the East, through his connection with the Philadelphia office. He thus brings to his new field a correct appreciation of the requirements of our patrons, so that it remains for him to overcome only the difficulties incident to a change of locality. We bespeak for him the confidence he deserves and the support he will strive to merit.

Competition and Protection.

Competition is not the simple matter that some "students of maxims instead of markets" seem to imagine. As we infer from their utterances, they conceive that two or more manufacturers (the more the better) compete for a given market. Competition cheapens prices, of course, and improves quality at the same time. As soon as a manufacturer cannot sell at a profit goods of the required quality competition ends. He withdraws from that market, and, if he can command no other, "seeks a more profitable occupation"—in which non-productive, transitory state of "seeking" these theorists, if they had their will, would keep a large proportion of the capital and labor of the world all the time; for it is to them as plain as A B C that the process forces everybody into "profitable occupation." But the competition which business men most fear begins just where these amateur economists think it ends, and the situation which they fancy drives the competitor out of the market really makes him, on the contrary, the most dangerous of adversaries in it.

Not to refer at all to actually insolvent concerns, who are merely keeping paper afloat, competition has five stages, in which its objects are respectively, profit, interest on capital, general expenses, repair and guarantee funds, and, finally, primary cost—i. e., the mere cost of the materials of manufacture and the wages of manual labor employed. It is the latter element only which figures in political editorials and stump speeches as "cost," and not infrequently it is subtracted from the market quotation of gross selling price, to ascertain the "profits" of the bloated employer. In the first stage above mentioned, competition cannot kill. Some manufacturers may thrive better than others, but all get along. The result, of course, is that in every line of business, if the conditions are only fairly favorable on the average, a few men or firms can be pointed out who have amassed great fortunes by reason of specially favorable conditions not possessed by their fellows. To attempt to bring down

their profits by any measure affecting the whole business would merely kill off their competitors and leave them a monopoly. The firm of Mr. Andrew Carnegie, for instance, possess an advantage in their own natural gas wells, possibly surpassing in amount the total profit of some of their competitors, and the location of their works at Pittsburgh secures to them, besides, an additional protection of several dollars per ton of product against foreign competitors. The ardent politicians who would like to strike Mr. Carnegie through the tariff ought to know that they will have to kill half a dozen great enterprises before they can even worry him. For he is, at all ordinary times, competing in the realm of profits merely.

As competition grows sharper, and in intervals of slack demand and low prices, the fight is for interest on capital. Here the financially weak, who are operating with borrowed capital, may go to the wall. But our great solvent concerns are prepared to forego not only profits, but a part or the whole of the interest on their capital, rather than abandon the field, or even suffer the injury and loss of prestige due to a temporary stoppage. It is in the next stage, however, that, as prices fall still lower, the real life-and-death battle begins. The general expenses are items which must be paid, as truly as the wages of the immediate producers; but the difference is, that the former would go on in nearly the same ratio, even if the manufacture were temporarily suspended. It costs so much a month for mines or iron works to stand still; and, unless the suspension is made intentionally for a very long time, this sum cannot be reduced. Rather than incur the evils of stoppage, the manufacturer will therefore endure the loss of part or all of the general expenses. Beyond the constant items of general expense come the provisions for repairs, renewals, bad debts, &c. These, of course, ought to be kept up, but rather than suspend operations they will be omitted from the calculation, and the product will still be made and sold, though it does not bring more than its primary cost.

The last and most desperate struggle of all comes when the market price of the product would not replace the material and labor actually in it. In pig iron this point would be reached when the price obtained for a ton of pig would not buy the ore, coal, and limestone, and pay the actual furnace labor necessary to make another ton. As an economic proposition, no wise manufacturer would feel justified in entering this stage at all. But as a business proposition, every manufacturer of a non-patented article may have to do it sometimes, and many must do it often. They are, of course, impelled by the hope that the necessity will be but temporary, but in many instances it lasts a long time. We have heard of single English houses selling below cost for years, in a particular market, and losing \$1,000,000 outright, rather than permanently surrender that market. American manufacturers have often shown the same spirit. If they obeyed the laws of political economy, and shut down their works every time the business was not profitable, their workmen would lead sorry lives. "No orders" does indeed shut many works at times, but orders at low prices are always eagerly

taken to keep the works running. The prices paid for a large part of the elevated railroad work in New York and Brooklyn, for instance, could not have covered general expenses and renewal funds, if, indeed, they covered primary cost.

Now, it is in the last two or three stages of the competition we have sketched that manufacturers need protection most, if they need it at all. And the principal objection to the notion of a strictly revenue tariff with "incidental protection" is that such incidental protection operates most when least needed and *vice versa*. For it calls for ad valorem duties, which are lowest when prices are lowest. But no protection is or can be given against home competition. Why should it be given against foreign rivals? Bethlehem, Troy and Scranton are not protected against Carnegie; why should they be guarded from Dowlais?

This is a fair question, to which the complete answer is complex. We wish to emphasize a single branch of it only—namely, the impossibility of foreseeing and providing for desperate foreign competition. The home situation we can watch. We can see the influences at work. So far as they result from Federal legislation, they are common to all American works, or, if injustice is done to any locality or business, appeal can be made to our own Government for a remedy. But we can neither foresee nor control the cause which may suddenly determine a foreign manufacturer to ship his unsaleable surplus stock to this country, and sell it here below cost in order to stiffen the prices of his home market. Perhaps some event in Egypt or India, reacting on the English money market, has affected particular establishments there, the American competitors of which did not dream that Egypt or India would thus indirectly bring a conflict upon them. This is scarcely a fancy. We have known of a large English operation connected with the iron business suddenly influenced, disastrously to American interests, by a panic in Turkish funds. It is in hard times, when dull trade has made competition among makers desperate, that this unforeseeable, unpreventable, uncontrollable foreign incursion is most to be dreaded. And no matter how long an industry has been established, it needs to be protected at this weak point so long as it has a higher "primary cost" than its foreign rivals. The function of a tariff in encouraging "infant" industries is another thing. Perhaps that may require much higher duties than the function we are now describing. We are not now concerned to inquire how high the duty should be in any given case or how this question should be examined. In other words, when our own manufacturers are standing against each other face to face in a struggle for primary costs, they should be safe against flank and rear attacks.

As prices rise and competition is carried into the spheres of interest and profits, the duty which was prohibitory before need not be prohibitory any longer. In these departments a fair fight is not feared by Americans. It will be seen that these conditions are met by a specific duty only, which thus appears, apart from its efficiency against Custom House frauds by undervaluations, to be the true means of a judicious protection. An ad valorem duty.

on the other hand, is either too high when prices are high, and favors "corners," to the injury of both the trade and the public, or it is too low when prices are low, and makes disaster more disastrous, operating thus at both ends to increase the oscillation of prices which disorganize and demoralize business.

The Business Cost of Pig Iron.

The statement of the items which enter into the cost of making pig iron has given rise to considerable discussion among those who conduct blast furnace enterprises, and is often utterly inexplicable to the outsider. The cost comprises:

1. The cost per furnace books.
2. The extra cost due to contingencies, accidents, interest on supplies carried, and interest on plant.

3. The selling expense, which includes the interest on the stock of pig iron carried unsold, the interest on sales from the date of sale to the date of payment, the guarantee fund for bad debts, the brokerage, the office expenses and the cost of loading on cars, since sales are usually reckoned at a price f.o.b at the works.

The first item is what is commonly included in the so-called estimates of the cost of pig iron issued by the promoters of new enterprises and adopted by amateur economists. Often these estimates do not even cover what the cost per furnace books should really comprise—namely, the cost at the furnace of ore, fuel and limestone, wages, salaries, supplies, and a renewal fund of such an amount per ton of pig iron as will on the average suffice at the end of the blast to put the furnace and machinery in good order for another. In cost sheets made for the information of proprietors only there should be also always an allowance for the inevitable shortage in fuel. Limestone is generally used from hand to mouth, and there is less chance of mistake or waste in regard to quantities. Ore is often accumulated in large quantities, and, being charged in small quantities, it is not likely that at the end, perhaps of several years, when an ore pile happens to be cleared up, the aggregate of the charges made by the barrowful will precisely equal that of the shipments received from the mines. The dump may overrun or fall short, and the precise fact may not be determined at the end of each year when the annual cost sheet is made up. It is impossible, therefore, to make allowance for it under this head, and it is usually omitted here and placed under the head of contingencies. But the fuel account is sure to show a deficiency by reason of the waste of coal and coke in handling, the dust not being charged into the furnace. The percentage of this deficiency varies according to the method of transportation and delivery, the amount of surplus stock of fuel necessary to be carried, &c. It is never safe, we think, to put it at less than $2\frac{1}{2}$ per cent. on the amount of fuel reckoned by the number and weight of charges, and 5 per cent is a common and reasonable figure.

The renewal fund is another variable item, the amount of which must be fixed by experience. In prudent practice it ought to include a reasonable amount of improvements. At the end of a blast it is not only necessary to reline the furnace, patch the boilers and put the plant as

nearly as possible in the same shape as at the beginning. This is the time when the ironmaster improves his tuyeres and connections, hot-blast stoves, and plant generally; and while the renewal fund is not expected to cover extensive reconstructions, it should cover such minor improvements incidental to repairs as experience has dictated. Of course a short, unlucky blast leaves an inadequate renewal fund, while a long and successful one accumulates more than is immediately required. We are satisfied that 50 cents per ton is not too much, and we know this is the amount charged to this account by some experienced managers. It is a mere question of bookkeeping, and some people prefer to put all such items in a construction account, which, if not properly considered, may lead simply to the steady increase of the fixed capital, and the final collapse of the business after years of delusive prosperity.

But when the cost sheet according to the furnace books has been honestly and safely made up, say at the end of the year (thus checking the weekly and monthly reports which all well managed works require as an approximate indication), there remain the other items we have enumerated. With regard to these we submit the following figures, taken from the books of a well-known, well-managed and solvent concern, and based on the actual business of a fairly prosperous and very recent year, during which many thousand tons of pig iron were made and sold. The items of interest have been calculated at 6 per cent. Careful analysis made by an expert and entirely disinterested accountant, shows the following result:

Extra cost and interest on plant and inventory.—The shortages discovered at the end of the year in old ore-dumps, &c., amounted to 38 cents per ton of pig iron made. But this was extraordinary, and it is estimated that for 15 years past, a fair average would be about one-third as much, or, say:

	Per ton.
Shortages and accidental losses, not otherwise accounted for.....	\$0.12
Interest on inventory of ore, fuel, and supplies.....	.34
Interest on plant.....	.54
Total.....	\$1.00

It will be observed that the first item is arbitrarily assumed, at a low figure, and that to this assumption only is due the suspicious roundness of the total.

Selling expenses.—These include the following items:

	Per ton.
Interest on stock of pig iron.....	\$0.84
Interest on sales, 30 days.....	.09
Guarantee fund for bad debts.....	.27
Brokerage at 1 per cent.....	.17
Office expenses (not at works).....	.06
Loading expenses.....	.15
Total.....	\$1.08

The interest on an average stock held an average of four months was calculated, not on the selling price, but on the furnace cost. The interest on sales is on the period of 30 days, allowed without the interest to purchasers for the settlement of accounts. The guarantee fund was deducted from the books for 15 years past and did not include exceptional instances.

The actual total of these two accounts during the year under consideration was \$2.34. But the total of \$2.03 which we have given is closer to the average of the

past 15 years. During that period, we may add, the concern in question has been obliged to increase its actual investment both in fixed and in floating capital to an average of more than three times what it started with. The present figure at which the property and plant stands on the books is larger than all the profits of the 15 years, without counting interest on capital at all; and if the concern desired to go out of business to-morrow the net result of the whole enterprise would depend upon its ability to find a purchaser at its valuation of the property, which, although it is far less than the amount actually expended in improvements, no sane man would be willing to pay, except for the purpose of continuing the business. In other words, this valuation represents far less than the cost of property and plant, and much more than its intrinsic value. It is its "business" value, so to speak, and a permanently unfavorable change in the business situation would seriously reduce it. The gradual increase of such business valuations is the effect of competition and progress, diminishing the profits of capital and imperatively requiring a larger and larger scale of operation. The concern to the courtesy of which we owe this glimpse into actual practice is now making, per furnace in operation, about six times as much pig iron as in 1873.

It thus appears that the business cost of a ton of pig iron is, in the case we have analyzed, at least \$2 more than the furnace cost. We cannot, of course, give names and details, but we can vouch for the accuracy of these figures, and from our knowledge of the general business we do not hesitate to say that they fairly represent the experience of really solvent enterprises in the manufacture of pig iron. Perhaps we should add that we have excluded from the above estimates the salaries of such officers as the president and secretary of the company, so as to make them applicable to individual concerns as well as incorporations. So far as such officials are ornamental, there salaries should come out of profits, and not be reckoned as part of the cost. It will be noticed, also, that the above estimates assume no difficulty in getting any required amount of money at 6 per cent.—a condition which a good many iron manufacturers would be glad to encounter. On the whole, therefore, while single items of the estimates may be deemed large by fortunate makers here or there, we feel sure that the general total does not overstate the burden carried by established and well-managed concerns in this business—and quite ignored by the smart statisticians who know all about it.

The unconstitutionality of the "drummers' tax" has been affirmed once more by the Supreme Court, the case decided by Justice Bradley being this time that of W. G. Asher, a resident of New Orleans, against the State of Texas. The State courts had upheld the local law making it a misdemeanor for any person to do business as a commercial traveler without first having taken out an occupation license. The State authorities held that there were differences between the Robbins Tennessee case, and urged, too, that the latter was in conflict with prior decisions of the Supreme Court. Justice Bradley seems to have disposed of these contentions very

briefly by holding that the Tennessee and Texas cases were practically identical, and that "the court has always supposed that a later decision has the effect of overruling a prior decision with which it may not be in harmony." Thus a vexed question appears to have been finally and decisively put at rest. Any taxing of a commercial traveler, a resident of another State, is a violation of the right of the general Government to regulate Interstate commerce.

A Court of Patent Appeals.

Among the measures of deep interest to the business community which did not come up for consideration of Congress is the House bill, No. 9084, relating to a proposed Court of Patent Appeals, which has been ably advocated by George Ticknor Curtis. Its double object is to secure some relief for the overburdened docket of the Supreme Court and to allow of more thorough discussion of patent, trade-mark and label cases. During the last term of the Supreme Court, 25 out of 325 were patent cases. Allowing two hours for each side for oral argument, and making a fair estimate of the time consumed in studying them and preparing the decisions, two months' work, at least, out of a term of eight months, was occupied by the highest court in the land, crowded as it is with important cases. It is urged with much show of justice that the greater part of the work thus devolving on the Supreme Court is the determination of questions of fact which could be as readily and as authoritatively decided by a special court, leaving the decision of questions of law to the highest tribunal. The testimony in patent suits is often very voluminous and conflicting, involving a wide variety of intricate mechanical and scientific subjects. Careful application to their study is expected to allow Supreme Court justices to master them without much difficulty, but certainly at a considerable sacrifice of time. No one who has even as an expert gone over the testimony in hotly contested patent suits will fail to appreciate the labor which an effort to master them must involve to one earnestly seeking to discover the truth.

To relieve the Supreme Court, and at the same time allow of an oral presentation of the facts not fettered by the present two-hour rule, the Patent Court of Appeals is proposed. It is not to be a board of experts, but it is to consist of three justices, lawyers, preferably men who have had experience in patent cases. They are to constitute an appellate court, to which, first of all, appeals from the decisions of the Commissioner of Patents in interferences are to go. As it is now, the inventor who believes that justice has not been done him in the Patent Office must appeal from its chief directly to the highest tribunal of the land. The proposed court would be a special and permanent tribunal for the revision of decisions made by the Patent Office. Composed of men trained to this peculiar duty, the new court would do away with the uncertainties in the construction and administration of rules of practice which have been inevitable in consequence of periodical changes of the Commissioner.

The proposed Court of Patent Appeals would be interposed also between the

courts of original jurisdiction, the Circuit Courts and the Supreme Court. Of course litigants retain the right to appeal finally to the Supreme Court, but the latter will deal only with questions of law and not with questions of fact. These must and can be argued at length, and to much better advantage to all parties concerned before the proposed tribunal.

Mr. Curtis has submitted the details of the bill to the justices of the Supreme Court. He has received from them suggestions which have been adopted and has secured their approval of the measure, which has been reported by the Judiciary Committee of the House. The manufacturing industries of the country can only look with approval and give their support to a proposal which holds out the promise of making less intolerable the law's delays.

Our Trade With American Countries.

The Bureau of Statistics, at Washington, has just published particulars of our import and export trade with all American countries during the fiscal year ended June 30 last. On comparing them with those of the previous fiscal year and arranging them accordingly, in tabular form, we arrive at some interesting and important facts. One important point should be taken into consideration, however: Shippers of goods by rail to Mexico and to the Dominion are not under any obligations to declare the quantity and value of their exports. The result is that the official returns are far below the actual amounts, as comparisons of American and Canadian figures and American and Mexican returns regularly show. Besides this, the smuggling trade is said to be of some magnitude.

U. S. Trade with Canada, Mexico, the West Indies, Central and South America.

	Imports— Thousands of dollars.		Domestic Exp't. Thousands of dollars.

Totals.....	224,141	210,485	108,683	98,259

The import has increased from \$210,485,000 to \$224,141,000, a difference of \$13,656,000, or about 7 per cent., chiefly due to the advance in coffee and sugar, as hides have only improved since June. The domestic export rose from \$98,259,000 to \$103,683,000, a gain of \$5,424,000, or 5 per cent. In other words, the greater absorption of American goods has nearly kept pace with the appreciation in the value of products we receive from the rest of America, which is highly satisfactory, and augurs well for our domestic export during the current fiscal year in our busi-

ness intercourse with those countries. This is all the more likely because coffee, sugar and hides have continued to bring good prices in the United States and Europe, causing general prosperity in the producing countries. Returning wealth to impoverished planters and stock raisers makes a great difference in our dealings with the commission merchants and shopkeepers in Spanish America and Brazil. Steamship lines in that direction have also been multiplying; soon there will be one under the Argentine flag.

We have, for the sake of further elucidation of the subject, prepared another table, showing the trade which the rest of America did with foreign countries in 1886. We append to it one exhibiting their population, which in the aggregate is only less than ours by a couple of millions.

Trade of Canada, Mexico, the West Indies, Central and South America in 1886 with Foreign Countries:

British Possessions.....	6,215,005	155,255	134,255
Dutch Possessions.....	113,300	2,800	2,700
Totals.....	56,836,252	588,192	588,847

The import was \$588,192,000 and the export \$588,847,000, nearly alike, but since that year the rise in products must have caused a greater volume, probably in about the same ratio as the expansion of our commerce with them. On comparing our total American trade in the fiscal year, 1887, with their total trade in the calendar, 1886, we find that the former was \$308,744,000, and the latter \$1,177,039,000. In other words, the latter was nearly four times the former. Our share in the American trade certainly should be larger, extensive though it may be, and we trust that a gradual favorable change will take place in this respect, situated as we are, and receiving such an enormous amount of colonial and other produce. Leaving this desideratum to be worked out by our activity and geographical position, as well as the excellence of our goods, it is gratifying to note that since the Centennial we have made considerable headway in exporting our merchandise to the countries named, that consequently what has been accomplished fully justifies the very best expectations for the future.

A matter to which attention was directed in a marked degree during the recent Scranton Meeting of the American Society of Mechanical Engineers was the utilization of coal dust as fuel. The accumulations throughout the coal regions have frequently been suggestive of very acceptable profits in places where efficient

means could be provided for burning the dust, especially under steam boilers, and attempts have not been lacking to develop a system of furnace practice which would meet the requirements. It is of some interest, however, to observe that no uniformity has been established in the accepted methods, and while one way of firing, say with large grates and slow rate of combustion, may have been found to give satisfaction in one place, exactly the reverse may be true in another. But the principal points appear to be the use of a shaking grate and the maintenance of a thin fire, so that cleaning can be readily effected. It is by these means that culm is being used so satisfactorily for steam raising at the works of the Lackawanna Iron and Coal Company, at Scranton, though it is but fair to state that the dust there is mixed with pea and buckwheat coal, for which the company can find no ready market. Forced draft on the closed ash-pit system is employed, and the boiler plant seems to give entire satisfaction. The question of comparative economies cannot, however, be at all considered in this particular case, since to burn the dust is there the most inexpensive way of getting rid of it. Something like 5000 tons of the mixture are consumed per month, the cost of the power being practically nothing except that of attendance. The conditions for a like record are, of course, not obtainable in all cases, but there certainly are many establishments where the dust, though possibly low in calorific value, might be burned to advantage, and under nearly equally favorable circumstances. We do not ignore the fact that, weight for weight, the culm may be so poor in quality, as compared with much higher priced coal, as to make its utilization not worth considering—in fact, unprofitable at any great distance from the base of supply, a much larger quantity of it being necessary to accomplish a certain result than of coal. It has not, however, been proven by any means that the dust, as a rule, is so poor a heating agent. It is eminently desirable that some good use should be found for it, and, while in the line of fuel briquettes and other forms of so-called artificial fuels it has not found an extensive field of application, it does not seem too much to expect its much wider and successful use as a fuel directly, especially in steam boiler furnaces.

Speculative Railroad Directors.

No single cause has contributed more largely to check the feeling of buoyancy in the business world than the happenings in the management of a few large railroads during the past few months. Complaints of the doings of speculative boards of directors are not new. Yet, the public receives a violent shock every time when insiders are forced ultimately to give an account of their stewardship, and it becomes impossible to conceal that the finances of great corporations have been allowed to drift into a frightful condition. It is true that, in the majority of cases, suspicion rests on roads whose managers are prominent in operations in Wall street, who are liberal with "points" and are eager to parade in the newspapers and on the tape their strong convictions of coming prosperity. The country has witnessed the spectacle of men, high in stand-

ing in financial circles, putting themselves on record in the most unqualified way, when they must have known that they were deliberately deceiving the public and their friends. Striking instances of this kind have happened in the past six months. They have done much to unsettle confidence at a time when the outlook seemed to warrant a bright future. Sharp practice like this cannot be too vigorously condemned. It is only too often accompanied by the cooking of reports of earnings and financial statements, and those who profit by stock operations during the period of concealment are only too apt to aid the demoralization following the final revelation of the truth for selfish purposes.

Another class of directors are those who autocratically handle the property committed to their charge with the best of motives. Long years of successful management may have bred a confidence and a pride which shrinks from acknowledging an error of judgment. Straining well-earned confidence and credit to the utmost to cover defeat or to tide over embarrassment, they are apt to surprise their friends and their enemies alike by startling developments. The difficulties into which one prominent system has been plunged lately will illustrate the dangers to investors and to the business interests of the country of such management. We attribute to such happenings as these the halt noticed for some time past in the rising tide of general prosperity. They are incidents which may delay but cannot in the long run arrest the movement. In nearly all the departments of the iron trade there is a hopeful feeling which augurs well for the future in spite of the setbacks which some of the developments in railroad circles have created.

English Competition in an Unexpected Quarter.

Under the provisions of the existing tariff, foreign competition in our domestic markets has been practically eliminated in many branches of the iron and steel trades. Tin plates, it is true, are wholly monopolized by foreign manufacturers, and cotton ties and wire rods are also largely in their hands, together with spiegeleisen and ferromanganese. We also purchase abroad considerable quantities of pig iron and steel rails whenever the consumption of these articles is so heavy that prices rise above the importing point. But in a very long list of iron and steel manufactures foreign competition has so completely disappeared that no apprehension is usually entertained of opposing bids being received from that source on domestic contracts. And, among them all, no interests have felt more secure in the impregnability of their position than the iron founders producing castings for every conceivable purpose. It is, therefore, with something of a shock to their serenity that they heard last week of the probability of a contract for 5000 tons of castings for a cable street railway in Denver being taken by English foundrymen. It is all the more aggravating to our domestic foundrymen, too, from the fact that these castings are not to be used on the seaboard, or only a short distance in the interior, but in the very heart of the continent, at a point so

remote from seaports that the inland freight rate is in itself a serious burden on the foreign manufacturer.

The contract in question was one of sufficient magnitude to invite bids from a large number of domestic foundrymen. Among the competing establishments were foundries in Chicago, St. Louis, Cincinnati, Kansas City, Omaha, Belleville, Ill., and Birmingham, Ala. No less than four Chicago concerns were represented among the bidders. The Chicago people confidently expected the contract to be secured by one of their number. They made very close bids, being anxious to have this work for the coming winter, when they would have little to do in their own specialty of architectural ironwork. A very low rate of freight from Chicago to Denver was also negotiated, the railroad companies being willing to do what they could to secure the work for Chicago and the freight for their lines. The lowest figure from American bidders is understood to have been made by the Chicago foundries and was under \$39 per ton of 2000 pounds, delivered in Denver, with a \$9 rate of freight between the two points. This was based on a cost of about \$16 per ton for pig iron at Chicago. Even Birmingham, Ala., with its very cheap pig iron, was unable to get under this Chicago bid. Yet English foundrymen, despite the duty, underbid the lowest American bidders about 90 cents per ton, through a broker in Kansas City. It is stated that they expect to ship the castings from Liverpool to Denver, via Galveston, for about \$7 per ton, or \$2 less than the rate from Chicago to Denver. The ratification of the contract is now awaiting the settlement of this freight rate.

An interesting question arises as to the rate of duty which will be paid on these castings. They consist mainly of yokes, so shaped as to support the track rails on their extended arms, the slot rails on central uprights, and the cable tube in an oval base. If they are wholly of cast iron it is difficult to see how they can pass the custom house at any other rate of duty than 1½ cents per pound under paragraph 157 of the Indexed Tariff. As it is asserted, however, that they will be imported at 45 per cent ad valorem, it is probable that they will be changed slightly from the condition of mere castings, so that they can be brought in as manufactures of iron under paragraph 216. If the duty of 1½ cents per pound should be imposed, it is evident upon very superficial computation that it would be impossible to import them at the price at which they are to be delivered. These facts will develop in time, as the occurrence is so important that it will not be allowed to pass wholly out of sight by the foundrymen interested.

Of vastly more importance than this one contract is the certainty of future foreign competition in a hitherto unaffected branch of trade, if it is carried through with satisfactory results to the English foundrymen and the Denver Railway. There is room for trouble in the adjustment of the proper tariff rates, in making sufficiently prompt deliveries, in supplying acceptable castings, and in figuring up a profit after the contract has been fulfilled to the letter. Should all these problems be solved in their favor, the groundwork will then have been laid for a large business in America by English foundrymen. They

would not touch a great deal of special work, and ordinary jobbing would not invite their competition, but carwork and bridgework and any other classes of castings made from standard patterns, and for which contracts are often given out in large quantities, would be open to them. With their very cheap pig iron and their very cheap labor and low Transatlantic freights, a 45 per cent. duty can be overcome in reaching this market. If, however, the duty of 1½ cents per pound, which appears to be the true rate on castings, should be imposed by the customs officers, our foundrymen will have no reason to fear outside competition, and can continue to pay their molders good wages on the American scale.

New Routes to Mexico.

The opening for through traffic from the United States boundary to the city of Mexico by the Mexican National Railroad Company is an event of more than ordinary importance in several respects, especially in bringing the two countries into closer commercial relations. The Mexican National has been in progress since the time of the opening of the Mexican Central, some four years ago, but the work was seriously retarded by the financial embarrassments of the Mexican Government, and was not pushed with vigor until English capital was enlisted and a new organization effected, so that within less than a year 352 miles of road have been built, connecting the sections which had been operated practically as independent lines. There are now in fact three separate routes from the United States to the Mexican capital, including the Mexican International, whose northern terminus is at Eagle Pass, from whence the track extends 384 miles to its intersection with the Mexican Central at Torreon. The three border cities, El Paso, Eagle Pass and Laredo, from henceforth will aspire to lead as centers for traffic with "our nearest neighbor."

The completion of the Mexican National is an event that more directly concerns points like St. Louis and Kansas City in the West and Galveston and New Orleans on the Gulf, which must ultimately derive important advantages from the inviting fields of enterprise which are now brought near to their doors. St. Louis, for example, now finds herself about 1900 miles from the Mexican capital and Kansas City about 1800 miles. This is a gain from 600 to 800 miles compared with the El Paso route. Taking into consideration the improved financial condition of the Mexican Government, which enables it to meet its obligations with promptitude, since the resumption of subsidy payments to the railroad companies two years ago, also the stimulus derived from new capital and the introduction of modern means of transportation in lieu of mule-packs, it is not unreasonable to expect a growth of traffic in that direction far beyond anything in former experience. To what extent the United States may be able to share in the trade of Mexico in competition with Europe, whose steamship lines concentrate at Vera Cruz, becomes an interesting question. Much depends probably on the consummation of the proposed reciprocal treaty.

It is not without interest to note that the Wheelock valves on the oscillating engines of the new Sound steamer Connecticut are 9 feet long.

CORRESPONDENCE.

Train Service and Accidents.

To the Editor.—The recent railroad disasters in Pennsylvania have, according to the testimony before the coroner's juries, demonstrated that carelessness borne of familiarity may bring to nought the intention of any system of rules arranged to protect the property of the railway company or the lives of its passengers. The lessons which these accidents teach offer a timely opportunity for some suggestions as to similar disasters which are daily invited by failure to carry out what are considered as the minor details of regulations adopted for the safety of travel. The business man, who spends a large portion of his time on railroad travel, and who is at all observant, can, on almost any trip, note some failures to carry out to the letter important regulations, and a few such may be mentioned.

It will probably be a surprise to most of those who travel between New York and Philadelphia to learn that heavy passenger trains of eight and nine cars are constantly run from one city to the other, on which the conductor has but one brakeman to assist him, in spite of the existence of a law of the State of New Jersey. When the conductor is taking up tickets from the rear cars, the brakeman is front; and, in case of the train coming to a stop, he must either jump from it before its movement entirely ceases, or waste what may be precious moments in reaching the rear of the train. If the brakeman goes back when the train stops, his reliance upon the system of signals encourages him to move with deliberation and even return before the signal is given from the engine. An instance of this occurred within ten days. Travelers in sleeping cars are familiar with the attractions they offer to trainmen, and instances may be mentioned where, on Western and Southern railroads, noted for long hours of continuous duty, the brakeman, whose place was at the rear of the train, was found asleep in the sleeping-car.

A gentleman, traveling on a branch of one of our prominent Eastern railroads during the present month reports that, at a grade crossing of another railroad, the conductor sat in the car reading a paper, while the brakeman attended to discharging passengers, came in to report that the connecting train was 9 minutes late and had 3 passengers. To this the conductor responded, "Pull ahead a little," and continued his newspaper perusal, while the brakeman signaled the train forward, then had it back to the station, when the connecting train arrived, received its passengers, and started the train on its journey. The conductor never left his seat until he went to collect tickets, and yet this was a branch of a railroad whose reputation for strict discipline is unequaled in the country.

The question which these instances suggest is: Are not the heads of departments contributory to this neglect by their failure to acquaint themselves with the method pursued by subordinates? The official's duty keeps him from devoting much time to travel, and, when he uses the road, it is generally in a special car or train, or, at all events, seldom in the cars which are patronized by the bulk of those who use the road, and these details of discipline escape his notice. If the officials upon whom the conductors, brakemen, engineers, switchmen and other employees depend for their positions could acquaint themselves more intimately with the manner in which the regulations are carried out there would be fewer opportunities for serious accidents, and the statement that our railroads are "run by

Providence, with a little help from the superintendents," would be further from the truth than it is now. J. B.

Tariffs of Transcontinental Lines.

The Interstate Commerce Commission, by Walker, Commissioner, has made public the result of its examination of the new transcontinental tariffs which were put in effect September 1, 1888. After stating the point of the former decision in the Denver case, that rates from San Francisco to Denver higher than the rates from San Francisco to Kansas City are not permissible under the short-haul clause of the act to regulate commerce, and showing that the new tariffs are clearly made in pursuance of an honest effort to conform to the provisions of the act as interpreted by the commission, the opinion proceeds to examine the details of the new system, which were not known to the commission until after they were put in force. The difficulties which arose at Chicago, St. Louis and other interior points from which rates were established to the Pacific Coast higher than the rates from New York City, are explained to have arisen from a series of commodity tariff which named articles on which low rates were made from specified points, leaving all other articles and points subject to the class rates under the Western classification.

In respect to these special tariffs the commission rules as follows: Rates that are just and reasonable from selected manufacturing points, through the entire territory east of the Missouri River and west of the Atlantic seaboard are *prima facie* just and reasonable from all other points in the same territory. A tariff naming a rate from one locality lower than that enjoyed by its neighbor, when circumstances are the same, tenders a preference or advantage to the first; and, when any shipper is damaged by the exaction of any additional burden, the preference becomes undue and unreasonable, unless it can be justified upon some sound and substantial ground. Common carriers are under obligations to take all descriptions of ordinary traffic from all points, and it is right that the rates should be known and announced publicly in advance of the offering of traffic. Under the act to regulate commerce shippers are not to be put in a position of subservience to common carriers, nor required to ask for rates, but are entitled to equal and open rates at all times. Discriminations are made and undue advantages are given by the special tariffs in question in giving different rates to places named and those not named, to manufactured articles named and those not named, to jobbers at places named and those not named, to manufacturers and to jobbers and other dealers. The opinion further states that these conclusions were made known on October 16 to representatives of the transcontinental lines at an interview arranged for that purpose, and were at once acceded to, the modified arrangements suggested by the commission as to west-bound business having gone into effect on October 23.

N. J. Mitchell, interested with M. V. Smith, metallurgical engineer, of Pittsburgh, is at the head of a movement to organize a scientific iron, steel and engineering society, to consist of young men between the ages of 18 and 25 years. This society is for the mutual instruction on everything pertaining to the above subjects, including mining and working of metals, civil and mechanical engineering, as well as the application of electricity. Young men of the above ages interested in such a movement will please address N. J. Mitchell, Hamilton Building, Pittsburgh.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., October 30, 1888.

After years of effort by the War Department the question of the country's defenses has at length taken tangible form in the appointment by the President of the Board of Ordnance and Fortifications provided for by the Fortification Appropriation act. The board, as already announced in general orders of the Adjutant-General's office of the War Department, consists of Major-Gen. John M. Schofield, General Commanding the Army, Col. Henry L. Abbott, Corps of Engineers; Col. Henry W. Closon, Fourth Artillery, and Lieut.-Col. Alford Mordecai and Capt. C. Morrison, Ordnance Department.

The act of Organization and Appropriation provides that the Board shall prepare suitable regulations for the inspection of guns and material at all stages of manufacture to the extent necessary to protect fully the interest of the United States. The order appointing the board provides that expenditures shall not be made or contracts entered into involving the Government in an aggregate expenditure exceeding \$6,500,000, nor an expenditure on the part of the Government in any one fiscal year in excess of \$2,000,000, and all guns and materials purchased under authority of this order shall be of American production and furnished by citizens of the United States.

The board has held a meeting for organization and expects to proceed at once in the prosecution of the objects for which it was created. It will begin operations by a careful review of the most advanced systems of defenses and plans of fortification in practical use by the great warlike nations of the globe, for the purpose of utilizing in a scheme of seacoast and frontier defense all the best features of known systems, with such improvements as the abilities, experience and skill of our own officers may suggest. The board will also take up the subject of defensive armaments for land defenses, high power ordnance, improved projectiles and warlike explosives.

The labors of the board in the end will involve large orders of iron and steel in the various forms required by modern defenses and guns. A member of the board, speaking on this subject, said: "It is well established that stone defensive works are practically useless. It is also conceded that earth works easily repaired are of merely temporary, uncertain and very doubtful means of defense against the destructive explosives discovered and devised by modern research and chemical skill. Therefore, the only recourse will be the designing and adaptation of steel armor for land defenses the same as for ships, the construction of floating batteries which can be moved about harbors or be operated along the seacoast and various other defensive contrivances." The officer remarked, further, "Now, all this will create an immense demand for iron and steel, which should be of enormous advantage to the iron industry of the country." It is expected that the board will be able to submit a preliminary report by the time of the meeting of Congress, although no further legislation nor voting of money will be required until the present \$6,500,000 available shall have been expended.

Tobin Bronze.—The Ansonia Brass and Copper Company, of 19 and 21 Cliff street, New York, have brought out a new bronze, the Tobin bronze, which they sell in the form of sheets and plates, rods, wire, seamless tubes and ingots. The latter are of three qualities, which are suitable for a large variety of purposes. A test made by Pro-

fessor Thurston shows a tensile strength of 67,600 pounds per square inch of original section. A series of tests made of hot rolled Tobin bronze by a board of naval officers gave a tensile strength varying between 58,734 and 59,905 pounds, and 5.5 to 5.625 per cent. elongation, cross-wise, and between 54,704 pounds and 62,389 pounds tensile strength and 4.5 and 7.875 per cent. elongation in the direction of its length.

OBITUARY.

HENRY W. OLIVER, SR.

Mr. Henry W. Oliver, Sr., one of the oldest residents of Pittsburgh, died at his home in Hazelwood, a suburb of that city, on Thursday, the 25th inst., in the eighty-second year of his age. The active cause of his death was pneumonia. Mr. Oliver was born in the year 1807, at Tattykeel, parish of Killdress, County Tyrone, Ireland. He married Margaret, daughter of David Brown, Esq., of Donoughmore, and settled in the town of Dunganon, where he became an influential citizen. Political opinions caused him emigrate to America, and he settled in Pittsburgh, 1842. He was engaged in the saddlery and harness business on Wood street until 1865, when he retired from active life. He represented the Twenty-third Ward in Council two terms, and was appointed by the Judges of the Courts of Common Pleas as a member of the Board of Viewers in 1877, to which position he was reappointed for 11 successive terms. His wife, with his four sons, David, Henry, James and George, the well-known iron manufacturers of Pittsburgh, and two daughters survive him.

PHILIP R. GEORGE.

Philip R. George, for over 40 years the manager of the mining interests of Cooper, Hewitt & Co., died suddenly of disease of the heart last Sunday evening, at Ringwood, N. J., where he has resided for the last 35 years. Originally a Cornish miner, by force of his ability, strict integrity and great energy he rose to the important position of manager of the most extensive and important mines in New Jersey. Mr. George was 68 years old.

Efficiency of Steam at High Pressures.

In an interesting paper on "The Efficiency of Steam at High Pressures," presented by Mr. W. W. Beaumont, at the recent meeting of the British Association for the Advancement of Science, it was attempted to show that the Carnot theorem as expressed by the equation

$$E = \frac{T - t}{T}$$

is inapplicable for the calculation of the efficiency of steam as used in a steam-engine cylinder. It is shown that the work done by expanding steam bears no relation to the fall in temperature due to fall in pressure, and that the dynamic and thermodynamic values of steam working expansively do not approach each other until an absolute pressure of over 200 pounds per square inch is reached. The relative dynamic values calculated by isodynamic or by any of the forms of the adiabatic formulæ, are not even approximately equal; but, with steam at pressures between 350 pounds and 50 pounds per square inch the work done by expansion varies from 692 foot-pounds to 900 foot-pounds per degree of fall in temperature.

In falling from 350 pounds to 300 pounds, the expansion work of a pound of steam is taken as 10,372 foot-pounds, while the fall in temperature, 15°, represents (taking the specific heat of steam for purposes of illustration as 1) 11,380 foot-pounds. In falling from 100 pounds

to 50 pounds, the expansion work done is taken at 49,280 foot-pounds, while the fall in temperature being 46.8°, the mechanical equivalent is 36,130 foot-pounds. In the former case, then, there is a difference of 1008 foot-pounds between the dynamic and thermodynamic work, the latter being the greater, while in the second case there is a difference of 18,150 foot-pounds, the dynamic or expansion work being the greater. Thus, at the lower pressures, the fall in temperature is much too small to account for the work done by expansion, while at the high pressures the fall in temperature is more than sufficient. Condensation of steam to provide for this difference must therefore take the place in the lower pressure engine cylinders. The argument leads to the conclusion that pressures higher than those now used can be very advantageously employed. When the exchange of heat due to difference in latent heat, total heat, and temperature at the different pressures is taken into account, the difference in favor of the high-pressure steam becomes much greater. An explanation is afforded of the great efficiency of triple stage expansion engines as compared with the lower pressure simple engines, and of the greater efficiency of the steam jacket on low-pressure engines than on high-pressure engines. It is clear that the steam in the steam engine must be considered with reference to the heat used, and not to the fall in temperature.

The McClure Coke Company, of Pittsburgh, have posted the following notice on their coke plants in the Connellsville region: "On and after November 1, 1888, until further notice, the following wages will be paid at the works of the McClure Coke Company: Mining and loading room coal, per 100 bushels, 85 cents; cagers, per run, \$1.78; drivers, shaft and slope mines, per run, \$1.78; drivers, drift mines, \$1.70; track-layers, shaft and slope mines, per day, \$1.78; track-layers, drift mines, per day, \$1.70; trappers, per day, 64 cents; inside laborers, per day, \$1.57; coke-drawers, per 100 bushels charged, 51 cents; levelers, per oven, 9 cents; car forkers, per car less than 40,000 pounds capacity, 90 cents; 40,000 pounds capacity and over, \$1.05; yard laborers, per day, \$1.27." The foregoing is an increase of 6½ per cent. over the present scale of wages. The J. M. Schoonmaker Coke Company, of Pittsburgh, have also posted a similar notice on their various works.

An Artificial Colliery.—One of the novel features of the Paris Exposition is to be an artificial colliery. During the descent into the mine the visitor is to be made the subject of an illusion. The sides of the artificial shaft will be formed of canvas painted to show the stratification in a typical deep pit. The cage begins to descend with a considerable velocity, but is brought gradually to rest within a few yards of the pit bank. As the motion of the cage is retarded, the canvas sides of the shaft are drawn up with increasing velocity, the acceleration being proportional to the retardation of the cage. The effect upon the spectator standing upon the deck of the cage is one of continued descent at the same speed at which he started, and the illusion is kept up after the cage comes to rest by a movement of trepidation communicated to the latter. The illusion is said to be perfect. When a great depth has apparently been reached, the canvas is brought to rest gradually, the trepidation of the cage being made to cease at the same instant. The visitor, who believes himself to be deep in the bowels of the earth, then steps out of the cage and enters the workings, where he may see the various operations of coal-getting.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St. }
PHILADELPHIA, Pa., October 30, 1888.

The past week has been fairly satisfactory on the whole, although there is not that buoyancy which characterized the market earlier in the month. Still, prices are steady, and for the present everything goes directly into consumption, so that there is no accumulation of stocks, nor any scarcity of business at about current quotations. Considering that this is the last week of the month, and the week preceding the election, the comparative dullness ought not to cause surprise, although it may give rise to a little uneasiness until the matter is settled. But the general feeling is hopeful, and it is believed that the outlook is such as to warrant at least a continuance of a volume of business such as we have had during the past two or three months.

Pig Iron.—A very considerable business has been done during the week, and in most cases at full quoted rates. There is also a good deal of inquiry for quotations on large lots, although it is hardly likely that they will be closed until after the election; then it will depend upon circumstances. As regards what may be the outcome, there is absolutely no basis upon which to form an opinion until the election is over. Sales during October appear to have been very much larger than the output, probably nearly double the amount, so that the coming month's business will be of unusual importance in determining the exact position. As matters now stand the balance of the year's output is practically all sold. Prices therefore, need not suffer under a very light business during the next few weeks, but the attitude of buyers will soon determine that point. If they decide to place orders during the early part of November, a very firm, if not a higher, market may be regarded as certain, while hesitation or procrastination will be just as likely to have the opposite effect. For the present, sellers show great firmness. Quotations are closely maintained and no inducements offered to effect sales beyond what are usual, as in the case of large buyers or to regular customers. As a matter of fact, sellers are about as much afraid of an advance as buyers are of a decline, which in some measure accounts for the uniform firmness with which prices are maintained. Sales during the past week have been made chiefly at \$16.50, \$17.50 and \$18.50 @ \$19, at tide, for the three grades, but some good brands have been made available at \$16, \$17 and \$18, while others of a specially desirable character have brought \$17, \$18 and \$19.50, according to circumstances. The feeling is decidedly firm, and at the moment concessions are not taken into serious consideration.

Blooms.—There is no change in prices, which are about as follows: Nail Slabs, \$29 @ \$29.50, at mill; Billets from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 @ "bloom" ton of 2464 lb. Foreign at tide, c.i.f., duty paid, \$30 @ \$31 for Nail Slabs; \$34 @ \$36 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—There is still something of a scarcity, and sellers are asking from \$30 to \$30.50, delivered, for good Bars. Buyers are holding back, however, and, while one or two sales have been made at these figures, there are evidences of hesitation, if not of weakness, at the prices named.

Bar Iron.—The demand is not quite as active as it was earlier in the month, and prices seem to be a trifle easier. This is perhaps more in appearance than in fact; first, because the quotations recently given were more or less nominal, and, second, because the figures now realized are decidedly better than those obtained some time ago for a similar class of orders, which are now about completed. For instance, mills that were loaded up with business at 1.75¢ would make their quotations 1.85¢ @ 1.90¢ on such small lots as they could sell. Now that they are open for large orders they accept 1.8¢ @ 1.82½¢, which, as a matter of fact, is an advance, although at first sight it looks like a decline. Quite a large amount of business has been taken under these conditions, and in many cases mills are again filled up for some weeks to come. There are others, however, that are on the watch for new business, and there is little doubt that buyers can do better than seemed likely two or three weeks ago. Some, of course, hold their prices with absolute firmness, but there are others who are either differently situated or who take a different view of the market. Prices are therefore irregular, varying from 1.85¢ to 1.95¢, according to circumstances, with still lower figures in exceptional instances. Skelp Iron is unchanged, 1.95¢ to 2¢ asked, with sales at the inside quotation.

Plate and Tank Iron.—A good deal of activity is reported in small lots, but large orders are still "in the near future." Mills are very busy, nevertheless, and the chances are favorable for their remaining so to the end of the year. It is understood that large orders from the shipyards will be placed during the early portion of the month, which will be sufficient to place the mills in a very independent position for some time to come. Meanwhile the constant demand from the smaller class of trade aggregates a nice amount from week to week and keeps prices steady and firm as follows: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—The feeling is a trifle easy in this department. Old work is being rapidly finished, but is not replaced as fully as could be desired with new orders. There is the usual talk of new things to come, but for the present the outlook is uncertain and not as encouraging as was expected some time ago. Prices are about as follows: 2.10¢ @ 2.15¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.8¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—There is a very good demand, and stocks are so light that mills are kept fully employed in meeting the demand for small lots to assort up with. Prices are firm at about the following quotations:

Best Refined, Nos. 26, 27 and 28.... 3¼ @ 3¼¢
Best Refined, Nos. 18 to 25..... 3 @ 3¼¢
Common, ¼¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28.... 4¼ @ 4¼¢
Best Bloom Sheets, Nos. 22 to 25.... 4 @ 4¼¢
Best Bloom Sheets, Nos. 16 to 21.... 3¼ @ 3¼¢
Blue Annealed..... 2.8 @ 3 ¢
Best Bloom, Galvanized, discount..... 62½ %
Common, discount..... 67½ %

Steel Rails.—The feeling is somewhat unsettled, and buyers and sellers appear to be a good way apart in their views. Manufacturers find the cost of production steadily hardening, and they begin to think that they ought to have prices to compensate, hence they are not inclined to meet the views of those who are talking lower figures. Ores are scarce and dear, and as the prospects of a decline are somewhat remote makers of Rails are not offering anything below \$29, and intimate that they must have that or more, or close

their mills. So far as this market is concerned the feeling is undoubtedly firm, based more on the high cost, however, than on any immediate prospect of an increasing demand.

Old Rails.—Nothing doing in this market, but the general position is the same as for weeks past. Lots in store are held at \$24 and upward, while buyers seem to get what they require from other points at prices ranging from \$24 to \$25, delivered at mills. Bids of \$23 @ \$23.50 can be had for T's on cars or to arrive, with sellers as above noted.

Scrap Iron.—There is plenty of demand at the prices quoted last week, which are again repeated, as follows: \$21 @ \$21.50 for cargo lots; \$21.50 @ \$22.50 for carload lots, delivered, or for choice \$23; No. 2 do., \$14 @ \$15; Turnings, \$18 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Merchant Steel.—The demand is well maintained at prices as follows: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Wrought-Iron Pipe.—There is still a very active demand, and mills have all the orders they can handle for some time to come. Prices are steady, with discounts as follows: Black Butt-Welded, 52½ %; Galvanized do., 42½ %; Black Lap-Welded, 62½ %; Galvanized do., 52½ %; Boiler Tubes, 60 %.

Nails.—There is no change of any importance, although there is a growing impression that prices are pretty well down to their lowest. Quite a number of mills are shut down, and are likely to remain so unless there is some very marked change in the position. In a general way \$2 is quoted from store, but there is no uniformity, so that \$1.90 @ \$2 is probably about the range, although at some points Nails are quoted at lower prices than these.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington St.,
CHICAGO, October 29, 1888.

A decidedly quieter condition of trade is noticed in nearly every branch, and for the first time the influence of the approaching election is felt in a diminished volume of sales and a general disinclination to enter upon new contracts. An exception is noted in such commodities as are always in greatest demand at this season, and which are therefore bought or sold without regard to extraneous influences. Such changes in prices as have come to light during the past week have been almost uniformly downward, but not sufficiently so to excite apprehension of a general break. The dullness of trade has caused occasional concessions from individual manufacturers apparently in need of orders, but the ordinary buyer will find very little change in the quotations made to him.

Pig Iron.—Few entries were recorded in the sales-books of the local dealers during the past week, and if there were any large lots among them, the fact has been carefully concealed. The members of the trade and the Chicago foundrymen, generally, are considerably agitated over a report that the 5000-ton contract for castings for a cable road in Denver, which had been confidently expected to be placed here, has been captured by English manufacturers. The contract is a very important one at this particular juncture, as the Chicago Architectural Works are short of orders, and it would have helped them

nicely in getting through the winter. An uncomfortable feeling prevails, also, in regard to other contracts for castings in which foreign competition may develop. Inquiries are in the market for a considerable quantity of Lake Superior Charcoal Pig Iron, prices of which are reported to be very firmly held. Although an advance in Southern freights of 20¢ per ton is to take effect on the 1st prox., the price of Southern Coke Pig Iron is slightly easier, lower rates being necessary if business is to be taken from Northern furnacemen. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$20 @ \$21; Alabama Car-Wheel, \$26.25; Jackson County Softeners, No. 1, \$18 @ \$18.50; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband), No. 1, 20.50 @ 21.50; other Ohio Soft Irons, No. 1, \$17 @ \$18; Lake Superior Coke, No. 1, \$18 @ \$19; No. 2, \$17 @ \$18; No. 3, \$16 @ \$17; Southern Coke, No. 1 Foundry, \$17.50; No. 2 Foundry and No. 1 Soft, \$17; No. 3 Foundry and No. 2 Soft, \$16.25; Gray Forge, \$15.75.

Bar Iron.—A few car orders are in the market, but there is no business of any magnitude in sight. The demand for small lots is brisk, but buyers usually ask for quicker deliveries than the mills can guarantee, which throws an unusual proportion of this class of trade into the hands of jobbers. About 1.75¢, half extras, f.o.b. Chicago, is the prevailing price for mill lots of Common Iron, with concessions obtainable only on very favorable specifications. Car orders are reported to have been placed at 1.75¢, flat, f.o.b. Chicago. Store prices still range from 1.90¢ to 2¢, according to quantity and quality.

Structural Iron.—Some small orders have been taken, but nothing heavy is to be expected so late in the season. Store prices are as follows: Angles, 2.35¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢. Mill orders are taken at the following rates, f.o.b. Chicago: Angles, 2.20¢ @ 2.25¢; Universal Plates, 2.23¢; Tees, 2.55¢ @ 2.65¢; Beams and Channels, 3.40¢. On combination orders, in which Angles form a part, prices have recently been seriously cut.

Plates, Tubes, &c.—Great activity has characterized this branch of trade, in marked contrast with the condition of business in most other lines. Large orders have been taken for Tank Iron, while boiler-makers have bought very freely from store. The Tank Iron orders were placed at unexpectedly low figures, in view of the prices hitherto quoted by the mills. In every other respect the market has been very firm, and former quotations from store are continued, as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢ @ 2.70¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 ¢ off.

Sheet Iron.—Deliveries of Black Sheets are now proceeding in more satisfactory shape, showing that the mills are not so crowded as they were recently. They quote for forward delivery 3¢ @ 3.10¢, at mill, for No. 27, according to time specified. Jobbers are selling freely at 3.20¢ for No. 24, 3.30¢ for Nos. 25 and 26 and 3.40¢ for No. 27, with a concession to best buyers.

Galvanized Iron.—Manufacturers' agents report renewed briskness in the demand last week, keeping them as far as ever from replenishing their warehouse stocks. Prices show no indication of moving upward, but, on the contrary, small lots are now selling at 60 ¢ and 5 ¢

off for Juniata, and 60 ¢ and 10 ¢ off for Charcoal.

Merchant Steel.—Open-Hearth Spring Steel, which has hitherto been held by the association of manufacturers at 2.90¢, has been taken out of their list, and the members of the association are free to make their own prices on it. So far nothing has come up to test values and establish a new quotation. Business is fair in a general way, but no heavy transactions are reported. Association prices are as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Inquiries are increasing for next year's delivery, and some fair-sized lots are wanted for this fall and winter, but so far as can be learned only some small orders were actually placed here during the week. Construction companies are trying to purchase Rails with bonds, notes and all other kinds of paper, but the manufacturers insist upon the cash. New railroad schemes are abundant, and excite renewed hope of better business next year. The makers are still quoting \$30 for all deliveries.

Old Rails and Wheels.—No transactions are reported in Old Rails. Holders ask \$24, but buyers are well supplied for the present and are not inclined to add to their stock unless the price should recede to about \$22.50. Mahoning Valley mills are said to be able to purchase Rails from the East at \$24, delivered. For Old Car-Wheels \$20 is asked, but no sales have come to light.

Scrap.—Large sales of No. 1 Railroad Scrap have been made during the past week at prices ranging from \$20.50 to \$21, and Track Scrap at \$19.50. The dealers here, as a rule, are not soliciting sales. Lots of 300 to 500 tons have, however, been offered by them at \$20, delivered to Chicago mills. Outside dealers are offering large lots at the same price. Notwithstanding the efforts of some of the dealers to work prices up, the feeling is generally in favor of a lower range of values in sympathy with other Old Material and easier prices of Manufactured Iron. Steel Scrap is looking up slightly, owing to inquiries from Pittsburgh mills. Mixed Country Scrap is still quoted at \$15. Selling prices of carefully selected Scrap are as follows, per ton of 2000 lb: Horseshoes, \$20; Axles, \$26.50; No. 1 Mill, \$15.50 @ \$16.50; Pipes and Tank, \$12 @ \$13; Light Wrought, \$11; Cast Machinery, \$15; Stove Plate, \$12; Cast Borings, \$9.50; Wrought Turnings, \$12 @ \$12.50; Axle Turnings, \$14; Coil and Leaf Steel, \$17; Locomotive Tires, \$15.50.

Hardware.—The Shelf Hardware trade is as active as ever, but in heavier goods business has been falling off from day to day. This is particularly the case with the country trade, the city demand being, if anything, stronger than it has been. In consequence of the drop in Lead the price of Shot has fallen from \$1.40 to \$1.25, and Solder is now quoted at 15¢ for strictly half-and-half. In Nuts an advance has been made from 5.75 ¢ to 5.40 ¢ off, or 70¢ per keg, for Square. This is due to the reorganization of the combination. No changes worthy of note have occurred in any other line.

Nails.—The current of trade is moving very sluggishly, and reported concessions on factory prices of both Cut and Wire Nails seem to have had very little effect thus far in quickening it. Regular quotations from factory are still \$1.90 for Steel and \$2.55 for Wire, both f.o.b. Chicago. Small lots are jobbing at \$2.10 for Steel and \$2.60 for Wire, but some weakness is manifested in this direction also.

Barb Wire.—The near-by trade is confined to small lots, which are supplied by jobbers at 2.90¢ for Painted, and 3.60¢ @ 3.65¢ for Galvanized. Our advices from merchants in Kansas and other Western States are to the effect that manufacturers are quoting carload lots at 2.75¢ for Painted and 3.35¢ for Galvanized, f.o.b. Chicago.

Pig Lead.—A few hundred tons were sold at rates ranging from 3.80¢ to 4¢, closing at the lower figure. It is reported that no Lead is pressing for sale here, but that transactions have occurred in the customary channels of trade only, no evil effects having followed the Corwith failure.

The charcoal furnace at Appleton, Wis., whose product is sold by Pickands, Brown & Co., 115 Dearborn street, Chicago, was burned on the 28th, the plant being reported completely destroyed. The fire was caused by the Iron breaking through the stack. The furnace would probably have been blown out by the 1st of January for repairs.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts. }
CINCINNATI, October 28, 1888. }

Pig Iron.—The local market for Pig Iron during the past week has been quiet. The only feature of interest has been the report of several sales of round lots of Iron made by a few Southern furnaces at prices a little under those now generally current. The belief is that these stacks had accumulated considerable Iron, which they were very desirous to sell, and the pressure resulted in lower prices. Otherwise prices are fairly well sustained. As a rule the market waits upon the Presidential election; buyers, although they anticipate higher prices, are still inclined to await certainties before contracting more largely ahead. The aggregate volume of business during the week has not been small, but individual sales have been light. There are no new features. General business is not active, and the money market is extremely easy. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$16.50 @ \$17.00
Southern Coke, No. 2.....	15.75 @ 16.00
Southern Coke, No. 3.....	15.50 @ 15.75
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley.....	17.50 @ 18.50
Hanging Rock Charcoal, No. 1....	20.50 @ 22.50
Hanging Rock Charcoal, No. 2....	19.50 @ 22.00
Tennessee and Alabama Charcoal,	
No. 1.....	18.50 @ 19.50
Tennessee and Alabama Charcoal,	
No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	14.75 @ 15.00
Mottled Neutral Coke.....	13.75 @ 14.00
Gray Forge.....	14.50 @ 14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 26.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

Nails.—There has been a fair movement during the week and the market has ruled steady. Jobbing prices are based upon 12d @ 40d, which sell at \$2.10 per keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2.10 and Steel Wire Nails at \$2.75 per keg.

Manufactured Iron.—No new features have been developed; there has been a fair trade and a firm tone has prevailed, without change in prices. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 8½¢ @ 4½¢ per lb.

Old Material.—There has continued to be only a moderate demand for Old Wheels, which are quotable at \$19 @ \$19.50, spot; Old Rails have ruled steady, with moderate sales at \$23, cash, here.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
Pittsburgh, October 30, 1888.

While there is scarcely anything heard or thought of just now but politics, there is continued activity in the general Iron and Steel trade. At the Vesuvius Iron Works, of Moorhead, Bro. & Co., the experiment of making gas from coal has been successfully made, and the cost for heating Iron is placed exactly at 60¢ per ton, which is very much cheaper than the present cost of natural gas. Brown, Bonnell & Co., Youngstown, Ohio, have abandoned natural gas and gone back to coal, owing to the scarcity and enhanced cost of the former. There is not much doubt that the manufacture of fuel gas from coal, and possibly from petroleum, will be a success sooner or later, and it is this apprehension, no doubt, that is unfavorably affecting natural gas stocks. When natural gas was first introduced the cost was less than that of coal, but it now costs fully as much and is not so reliable; at times the supply is short, so that for a time a mill may have to shut down. The cost of natural gas to private consumers has in many instances been more than doubled within a year, but not many of them are going back to coal. It is claimed that the price of natural gas was too low, but until the past year or so there were so many companies and so sharp was the competition that it was impossible to advance the rates; now that nearly all other companies have been absorbed up by the Philadelphia company, the price has been pushed up, and this has had very much to do with experimenting on manufactured gas to take the place of natural gas.

Pig Iron.—No particular changes to note in the situation. While the market is quiet, and possibly a little easier, there is no falling off in consumption, which never was much, if any, larger than it is at present. Production is also large, and being increased as additional furnaces are being started, but there is no accumulation of stock, and the market is in a good, healthy condition. As compared with prices of a week ago, there has been no change, with the exception of Bessemer, some sales of which have been made at a decline of 25¢ @ 50¢ per ton. We quote as follows:

Gray Forge Neutral.....	\$15.75 @ \$16.50,	cash.
All Ore Mill.....	16.75 @ 17.25,	"
White and Mottled.....	15.00 @ 15.50,	"
No. 1 Foundry.....	18.00 @ 18.50,	"
No. 2 Foundry.....	17.00 @ 17.50,	"
Charcoal Foundry.....	21.00 @ 24.00,	"
Charcoal Mill.....	19.00 @ 20.00,	"
Cold Blast Charcoal.....	25.00 @ 28.00,	"
Bessemer Iron.....	17.50 @ 18.00,	"

Standard brands of Neutral Mill selling at \$16 @ \$16.25, cash, and while furnace-men are refusing to sell Bessemer below \$18, cash, consumers have no trouble in getting all they want at \$17.50.

Ferro and Spiegel.—Sales of 80 % Ferromanganese, at \$56.50 @ \$57, cash, and 20 % Spiegel at \$28.50, cash.

Muck Bar.—There has been but little new business reported during the past week, but prices remain unchanged at \$28.50 @ \$29, cash. There does not appear to be as much inquiry as there was some time ago, but so far as we are advised there is no pressure to sell.

Manufactured Iron.—There is nothing new or important to note; while there is not so much new business, mills are nearly all sold ahead and have about all they can do, and this will no doubt be the situation until the close of the present year, when there is usually a lull for a week or two. Prices remain unchanged: Bars, 1.80¢ @ 1.85¢; Plates, 2.20¢ @ 2.25¢; No. 24 Sheet, 2.85¢ @ 2.90¢, all 60 days, 2 % off for cash; Skelp Iron, 1.85¢ @ 1.90¢ for Grooved, and 2.10¢ @ 2.15¢ for Sheared.

Nails.—No change in prices here; full card rates are still being demanded and obtained; but it is said that Wheeling is again cutting 10¢ @ 15¢ per keg below. Wheeling cannot make Nails any cheaper than Pittsburgh, and Pittsburgh manufacturers aver that even at full card rates the margin for profit is small. We continue to quote upon a basis of \$1.90 for 12d to 40d, 60 days, 2 % off for cash.

Wrought-Iron Pipe.—Manufacturers report little or no change in the situation as compared with that of a week ago. Possibly there is not quite so much new business, for the mills are busy and are likely to continue so until well toward January. No change in prices. Discounts on Black Butt-Welded Pipe, 52½ ¢; on Galvanized do., 45 ¢; on Black Lap-Welded, 62½ ¢; On Galvanized do., 52½ ¢; Boiler Tubes, 60 ¢ off regular list; Two-inch Tubing, 13¢ per foot, net; 5½-inch Casing, 40¢ per foot, net.

Old Rails.—There have been sales of some 3000 tons reported at \$25, cash, including 2000 tons for delivery at Youngstown, Ohio, at price quoted. Some of the railroads have bought new Steel Rails and are putting in Old Iron Rails as part pay; so far as we can learn, there are no American Tees offering below \$25.

Steel Rails.—Some round-lot orders have been booked here within the past few days, but terms are strictly private. It is said, however, that sales were made for delivery during the next five or six months as low as \$28.50 and even \$28.25, cash, delivered on cars in Pittsburgh. It is reported here that the syndicate is not harmonious, and that an early dissolution of the same is not improbable.

Blooms, &c.—Bessemer Steel Blooms and Billets are still quoted at \$29 @ 29.50, cash, on cars at makers' works; Nail Slabs, \$28.75 @ \$29; Domestic Bloom and Crop Ends, \$19 @ \$19.50. Steel mills are pretty generally busy.

Merchant Steel.—There is a continued good degree of activity, but no recent change in prices. Best Brands of Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery, 5¢; Open-Hearth Steel, 2½¢.

Railway Track Supplies.—Prices remain unchanged. Spikes, 2¢, 30 days, delivered; Splice Bars, 1.80¢ @ 1.85¢; Track Bolts, 2.85¢ with square and 2.95¢ with hexagon Nuts.

Old Material.—There is a fair demand, and prices are steady. No. 1 Wrought Scrap, \$21, net ton; Car Axles, \$26 @ \$27; Cast Scrap, \$16, gross; Cast Borings, \$12.50 @ \$13; Car Wheels, \$20.

One of the latest rumors is that Mr. John Walker, who recently withdrew from the firm of Carnegie, Phipps & Co., and James I. Bennett, for many years of the firm of Graff, Bennett & Co., are to form a partnership, and re-enter the Iron business. As yet the rumor lacks confirmation.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, October 29, 1888.

The past few days has demonstrated the inadequacy of the railroad lines to meet the wants of the shippers. Although the lines have added largely to their rolling stock during the year, they are still far behind the requirements of the country. A prominent railroad official is reported to have said that if 15,000 new cars, with the necessary motive-power, were divided up among the different lines they would all be absorbed at once in moving the freight that is being offered. The money market shows a continued stringency and high rates of discount still prevail. The cotton

crop is drawing heavily upon the resources of the banks, and another reason for the scarcity of money is the fact that of the many thousand manufacturing enterprises that have been started throughout the South, a large majority of them have absorbed their capital on the construction of buildings and purchasing machinery, leaving their sources for running expenses dependent upon their bills receivable, which are available only at the banks, or more frequently on the street; even their cash sales more frequently than otherwise run from 30 to 40 days before they are available. Bank rates are from 10 % to 12 %, and outside 12 % to 18 % per annum, on what is considered short-time No. 1 paper.

Pig Iron.—There are hardly any changes in the market worthy of mention. The same condition of affairs continues as reported during the past few weeks. Consumption and demand appear to be about equal with the output. The reinforcement to the supply by the blowing in of new stacks does not appear to be a factor worthy of notice, and the product of those that are still to come will probably be absorbed without causing even a ripple in the general market. It appears to be a matter of surprise to many producers where it all goes to and what is done with it; but, nevertheless, it all goes somewhere, and is utilized for some purpose or other and is all paid for. In reference to price there is no change either way to report. Most of the furnaces have contracted their output for the balance of the year, and many have reached ahead as far as July 1, 1889—mostly on a basis of present prices. At the present writing there are in the Birmingham district 14 stacks blowing and 6 idle; in the Chattanooga district 10 blowing and 2 idle. Most of those that are idle will go in blast within the coming month and four new ones that are nearly completed will probably blow in before the 1st of January next.

Cleveland.

CLEVELAND, October 29, 1888.

Iron Ore.—The total amount of Ore sent down by the different ranges to date is as follows: Marquette Range, 1,543,447 tons; Gogebic Range, 1,100,451 tons; Menominee Range, 926,190 tons; Vermillion Range, 368,385 tons; total shipments to date, 3,938,478 tons. Ore is still coming down at a rapid rate, and there seems little likelihood of any advance in lake freights. The Escanaba rate is now \$1.25 per ton, while the freight from Ashland and Two Harbors is but \$1.65. This rate is considered very reasonable by both dealers and purchasers and, sales would be much more numerous but for the fact that under the advancing market of a month ago buyers bought quite freely and are now fairly well supplied. This reason, together with the hope that quotations might possibly be lower, has led them to delay further purchases. Dealers are holding the few Ores still in the market at last week's prices. A few scattering sales are reported, but none sufficiently large to furnish material for a correct estimation of the business likely to follow closely upon the heels of the election. The following are the latest quotations, f.o.b. cars lower lake ports:

No. 1 Specular and Magnetic Ores, Bessemer quality.....	\$6.00 @ \$6.15
No. 1 Specular and Magnetic Ores, Non-Bessemer quality.....	5.25 @ 5.50
Red Hematite Ores, Bessemer quality.....	5.00 @ 5.25
Red Hematite Ores, Non-Bessemer quality.....	4.20 @ 4.4
Menominee Range Ores, Bessemer quality.....	5.25 @ 5.5
Menominee Range Ores, Non-Bessemer quality.....	4.00 @ 4.25
Gogebic Range Ores, Bessemer quality.....	5.25 @ 5.50

Pig Iron.—A light and yet a fair trade characterizes the local market. The de-

Siemens-Martin Steel, Charcoal finish, \$5 @ \$5.75; Coke finish, \$4.70; Ternes, \$4.20 @ \$4.35; Bessemer Cokes, \$4.45 @ \$4.50, and Wasters, \$4.25. Net import into this country during the first eight months, 454,445,062 lb, against 430,218,960 in 1887.

Lead.—Outside of the Metal Exchange, where, during the week, only 164 tons were sold, the sales amounted to about 1000 tons at 3½¢ @ 3¼¢, closing at 3.70¢ @ 3.80¢. Everything remains in confusion, pending a clearer insight into Corwith & Co.'s winding up settlements, and consumers do not feel disposed to do anything to speak of till after the elections. At St. Louis the price is 3½¢. In London Soft Spanish gave way from £13.15/ to £13.5/.

Spelter.—At the West Ore has improved from \$30 75 ton to \$31, and is scarce at that, while the output will decrease when the cold weather sets in. The demand here is moderate, and supplied at 5½¢ from second hands, but it cannot be sold without loss by smelters for less than 5½¢, at which Common Domestic is held, and Silesian at 6¢.

Antimony.—Hallett has continued selling moderately at 10½¢, and Cookson at 12½¢ @ 12¼¢.

New York Metal Exchange.

The following sales are reported:

THURSDAY, October 25. (Under the rule.)		
100 tons Lead, spot.....	3.82½¢	
64 tons Lead, October.....	3.85¢	
(Seller's right to double.)		
FRIDAY, October 26.		
16 tons Tin, November.....	3.80¢	
100 tons Lead, October.....	3.80¢	
SATURDAY, October 27.		
22 tons Lead, December.....	3.70¢	
MONDAY, October 29.		
16 tons Lead, spot.....	3.65¢	
TUESDAY, October 30.		
10 tons Tin, spot.....	23.00¢	

Financial.

The Presidential year 1888 is no exception to the rule that dullness in business is characteristic of the few days that immediately precede the casting of the vote. Nevertheless, in most lines there is a fair degree of activity, and indications generally are unusually favorable. The marketing of the crops is in larger volume as the season advances and the traffic returns from the various lines of transportation indicate a movement largely in excess of the corresponding date last year. The approach to the closing of navigation, as well as the movement of the corn crop, encourages the view that before long rates will be established upon a more stable basis. The one disquieting feature is the small volume of exports. The aggregate returns of leading clearing houses are also larger in comparison. There is certainly no retrograde movement. It is to be observed, further, that those points recognized as peculiarly industrious, such as Pittsburgh, Detroit, Cleveland, Philadelphia, Worcester and Lowell, all report substantial gains. Local reports refer to a fair trade among dry goods jobbers. In groceries the South is among the heaviest buyers in the market just now, and collections from that section are said to be unusually good. One of the leading houses reports that collections even in Florida, outside the yellow fever districts, are better than before for many years. Coffee is about the weakest on the list, sugar is slack, and other goods somewhat nominal in the absence of business. The position of breadstuffs is more confident, but speculation is still active and actual transactions are unimportant. Corn is offered freely at a decline. Cotton spot stock is steady, with a better demand. Provisions are controlled from Chicago—

spot and future stuff for export as dull as ever. The Florida orange crop, just coming to hand, is pronounced the largest ever known and in fine condition. The President has appointed Spencer B. Newbury and Rush C. Hawkins, of New York, to be assistants to the United States Commissioner General to the Paris Exposition.

Stocks were well supported early in the week, partly on buying orders from London, but toward the close prices were weaker, with few exceptions, in consequence of losses from railroad operations, particularly among Eastern roads, although at one time Reading led in the decline, being affected by the unfavorable financial statement. It was considered likely that the complaints to the Interstate Commerce Commission against the Lehigh Valley for discrimination were responsible for some selling of the coalers. The Terminal group again on Saturday lost fractionally on the current talk of legal difficulties attending the lease of the East Tennessee to the Danville and the sale of Georgia Central to Terminal. On Monday bears gave special attention to the coalers, following up their previous sales of Reading with further selling of both that stock and Lackawanna. The suits of Cox Bros. & Co. accounted, it was said, for these sales in large measure, as the decision in the cases may have some bearing upon the business of other Coal roads than the Lehigh Valley, the one directly interested. On Tuesday there was a vigorous raid upon New England, Reading and the grangers, which had an unsettling effect upon the whole list, but the tone was stronger at the close.

Government bonds were steady and unchanged, as follows:

U. S. 4½s, 1891, registered.....	108½
U. S. 4½s, 1891, coupon.....	108½
U. S. 4s, 1907, registered.....	127½
U. S. 4s, 1907, coupon.....	127½
U. S. currency 6s.....	121½

Up to date the Government has purchased under the April circular \$51,392,000 4s and \$38,355,350 4½s. The 4s have cost \$66,005,539 and the 4½s \$41,866,634, and the saving to the Government in anticipating their redemption before maturity is about \$26,500,000.

Foreign exchange was firmer, with posted rates \$4.84½ @ \$4.88½. Although the exports from New York for September were smaller than for any previous September for 12 years, the foreign commerce of the country as a whole is shown by the monthly report from Washington to have been more favorable than was expected. The total exports for the month were \$54,112,117 and the imports \$56,691,490. For the same month last year we exported nearly \$3,500,000 more in produce and manufactures and imported \$2,000,000 more of foreign merchandise. But for September of this year we have imported \$13,000,000 less of gold and silver, and have exported nearly \$1,000,000 more of coin and gold bars, which accounts for the fact that the outgoing volume nearly balances the incoming tide. The following is a comparison of the returns from January 1 in each of the last three years:

	1886.	1887.	1888.
Total exports.....	\$545,639,205	\$517,622,990	\$495,845,741
Total imports.....	525,022,023	576,108,528	561,264,536
Excess of imports.....		\$58,484,568	\$65,418,795
Excess of exports.....	\$20,616,182		

For the first nine months of 1888 the excess of exports was \$52,746,789, making a difference between this year and that of \$118,165,584, which is accepted as quite sufficient to account for the prevailing depression in business. At the same time the present condition of the market for foreign exchange is pointed at as evidence that the large balance has been settled by the exports of American securities. Respecting the present case in London,

monetary writers there describe the situation as factitious, as future heavy calls for gold are looked for from Russia and the Argentine Republic.

The weekly bank statement shows a decrease of \$1,200,000 in surplus reserve, which now stands at \$15,698,400, against \$11,926,000 last year, and \$6,398,000 in the last week of October, 1886. In loans there was a slight contraction. In other respects there were no important changes. The call for currency continued heavy in the South. Time loans are easier, being quoted at 3¼ % for 60 days and 4 % for four to six months. The best single name commercial paper sells at 5½ @ 6½ %, and fair indorsed at 4½ %. There is a fair demand for paper, and the supply limited.

The total clearings of 38 cities last week show an increase, compared with last year, of 7.2 %; outside of New York, 10.5 %. New York increased 5.4 %; Boston, 21.8 %; Philadelphia, 17.7 %; Chicago, 6 %; St. Louis, 6.4 %; Pittsburgh, 12.5 %; New Orleans, 4.2 %; Kansas City, 20.9 %; Milwaukee, 8.2 %; Minneapolis, 3.7 %; Omaha, 28.2 %; Denver, 14.4 %; Detroit, 34.2 %; Cleveland, 10.3 %; Memphis, 10.4 %; Hartford, 11.6 %; Peoria, 23.9 %; Grand Rapids, 18.3 %; Topeka, 14.1 %; Baltimore, decrease, 1.9 %; San Francisco, 12.2 %; St. Paul, 10.02 %; Galveston, 9.1 %; Indianapolis, 11.2 %; Columbus, 4.9 %; Wichita, 15.8 %; Duluth, 30.9 %; Norfolk, 9.7 %, and St. Joseph, 25.8 %.

The exports of specie from this port during the week amounted to \$969,000 and the imports to \$98,000. Since January 1 the amounts respectively are \$30,842,000 and \$6,396,000, against \$14,597,000 and \$37,765,000 in 1887. It is announced that a strong New York syndicate, including many influential capitalists, have bought a very large interest—about \$1,000,000—in the company owning the city of Annistown, in Alabama. The organizer of the syndicate is William Henry Woods.

The importations of merchandise at this port during the week were valued at \$9,100,000, of which \$2,000,000 represent dry goods. Since January 1 the total is \$385,840,712, as compared with \$390,470,937 for the same time last year. The exports were \$6,512,317; not a bushel of wheat was included, yet speculators are indifferent. Some 15,000 sacks flour were bought by English shippers—the first in a long time.

The St. Louis National Bank, which has been a United States depository for 20 years, will close its Government accounts, the business being no longer profitable.

Coal Market.

The Anthracite Coal trade is comparatively dull, although a fair amount of business is in progress. In the face of a continued large production at the mines and a lessened demand, prices have a softening tendency. Stove is the only size not in excess, and in consequence the full circular is not insisted upon as rigidly as a short time ago. It is announced that there will be no advance in November. Red Ash is scarce. The one marked feature is the enormous output for the week, aggregating 886,469 tons. This is a decrease of 82,000 tons compared with the previous week, but the amount is fully up to the average since the commencement of the active season, and is 139,000 tons larger than for the corresponding week last year. Since January 1 the total is 31,206,000, as compared with 28,287,000 tons for the corresponding period in 1887. The output from the Schuylkill region is the same as for the previous week, but the Lehigh reports 31,000 tons less and the Wyo-

ming 52,000 tons less. The Lackawanna, it is said, has reduced the working time. Quotations are unchanged—viz: Hard White Ash, Lump, \$4.50; Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Free-Burning, f.o.b., Broken, \$3.95; Egg, \$4.30; Stove, \$4.65; Chestnut, \$4.65; Pea, \$2.75.

The interest of the trade for the time being is concentrated on the case of Coxe Bros. & Co., now before the Interstate Commerce Commission. This firm of individual colliers, whose shipments amount to 1,500,000 tons per annum, last week filed with the Commission, at Washington, a complaint against the Lehigh Valley Railroad alleging that the road discriminates against the firm of Coxe Bros. & Co., and other shippers in favor of the Lehigh Valley Coal Company. The complaint avers that the Lehigh Valley Company is a producer of both Anthracite and Bituminous Coal, and carries Bituminous at about one-half of the rates per ton per mile charged on Anthracite; that much of the Bituminous comes in competition with certain sizes of Anthracite (Pea, Buckwheat, &c.), and that in consequence of a discrimination in favor of the Lehigh Valley Coal Company, Coxe Brothers & Co. are obliged to dump on the banks a large quantity of these sizes and allow it to go to waste. The complaint also charges that the Lehigh Valley Railroad Company, being the owner of the Lehigh Valley Coal Company, sells Coal in New York Harbor at prices below the sum of the current price for Anthracite at the mines, and the charges for transportation paid by other producers, and that in consequence of this discrimination in favor of the Lehigh Valley Coal Company that concern has been enabled to secure large contracts for delivery in New York Harbor, which were entirely out of the reach of competition by Coxe Brothers & Co. and other shippers. One of the contracts referred to is that of supplying the Manhattan Elevated Railway Company, and it is alleged that, although President Sloan, of the Delaware, Lackawanna and Western Railroad, is a director of the Manhattan Company, he is unable to compete with the Lehigh Valley for the benefit of his own road.

It is reported that a syndicate is preparing to take charge of and to expose a great coal vein along the line of the Texas Pacific. At the head of this syndicate is Col. R. D. Hunter, of St. Louis, associated with capitalists in New York and Texas, who purchased mines on the Texas Pacific, 80 miles west of Fort Worth, including 23,000 acres of Coal land. The Coal is of the bituminous variety. The company is known as the Texas Pacific Coal Company, capital, \$2,000,000.

Bituminous Coal is active, and the supplies are scarcely equal to the demand. Pool prices remain unchanged. Cumberland reports for the week 72,000 tons and Clearfield 58,000 tons. Shipments in either case are some 200,000 tons in excess of last year's product up to October 20.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Oct. 31, 1888.

The report has circulation that a movement is under way for an anti-syndicate "deal" in Copper, the aim of which is to transfer the control of the market from the French speculators to England and thereby overcome the existing feeling of insecurity. The impression derived from the meager information imparted is that the "deal" is practically a combination of

English and American companies. In apparently well-informed quarters it is stated that indications are very promising for the consummation of the project and the elimination of the purely speculative interest, but as to the date the proposed combination would go into force, and regarding the result upon existing contracts with the French syndicate, no satisfactory information is given. Speculation in both Chili Bars and G. M. B. Copper has been very quiet again, and consumers are still indifferent buyers, not only of Bars, but of furnace material.

The week's operations in Block Tin have been large (the best part of 1000 tons, all told), but the market showed less spirit the last few days. The position continues to favor a strong market, and the Batavia sale of Billiton, realizing as it did £2 above European quotations, served to infuse more or less tone. Offerings, however, have been liberal enough in the local market to operate against a rise, and to-day's prices are the lowest of the week.

There has been no radical change in the Tin-Plate market. The demand continues fairly active, but buyers and sellers are still apart on prices, and new contracts are thereby restricted. Makers have the books full for the next 30 days and are turning out about 125,000 boxes per week. Prices are maintained on prompt deliveries, but irregular on futures. The labor difficulty at the Margam works has been settled and the mills are in full operation.

Pig Iron has been in more active demand for consumption, and this, together with the fact that five furnaces have been damped, thereby reducing the supply considerably, gives the market a stronger tone. Activity is still reported from the Steel works in nearly all sections, and manufacturers have orders booked that will keep them busy the balance of the year. In some cases new orders are being refused. Additional Steel plant is being erected in several localities.

The market for Old Iron Rails has continued slow, and holders, who have been expecting large American orders, express disappointment. Prices for these and for Old Material generally are nominal in a great measure, owing to the moderate trade passing. Offers of Old Rails have been made at lower prices.

Scotch Pig—Apart from 1/6 decline on Summerlee there has been but slight variation in prices. Business has been fair as a whole.

No. 1 Coltness, f.o.b. Glasgow	49/6
No. 1 Summerlee, " "	49/6
No. 1 Gartsherrie, " "	47/6
No. 1 Langloan, " "	49/
No. 1 Carnbroe, " "	43/
No. 1 Shotts, " at Leith	49/
No. 1 Glengarnock, " Ardrossan	47/6
No. 1 Dalmellington, " "	42/6
No. 1 Eglinton, " "	41/6
Steamer freights, Glasgow to New York, 6/6	
Liverpool to New York, 10/.	

Cleveland Pig—The market has shown little change, demand running fair and prices ruling steady. No. 1 Middleboro', G.M.B., 37/; No. 3 do., 34/6.

Bessemer Pig—There continues to be an active business in this branch and prices are very firm. West Coast brands, mixed numbers, 45/3, f.o.b. shipping point.

Spiegeleisen—The demand continues fairly active and prices remain firm. English 20% quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails—There is still a large business. Prices are variable, but the market quite strong in tone. Standard English sections quoted at £3. 18/9 @ £4, f.o.b. at N. W. England shipping point.

Steel Blooms—Demand has been slow, and transactions are reported at slightly lower prices. We quote £3. 18/9 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets—In these there is still an active trade, and prices remain very firm. Bessemer, 2½ x 2½ inch, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Slabs—The demand continues moderate, and makers have accepted lower prices. Bessemer, £3. 18/9, f.o.b. at N. W. England shipping point.

Steel Wire Rods—A quiet market, and holders naming former prices. Mild Steel No. 6 quoted at £5. 19/3 @ £6 and No. 5 at £5. 18/6, f.o.b. at N. W. England shipping point.

Scrap Iron—Demand continues moderate and former prices prevail. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Old Rails—The demand has continued slow and prices are still rather weak. Tees quoted at £3 and Double Heads £3. 3/9, c.i.f. New York.

Crop Ends—Moderate sales only, and former prices current. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate—The situation is about the same as last week, buyers and sellers being considerably apart. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3 @ 15/9
IC Bessemer steel, Coke finish	14/ @ 14/3
IC Siemens	14/3 @ 14/6
IC Coke, B. V. grade	13/6 @ 13/9
Charcoal Terne, Dean grade	12/ @ 12/6

Manufactured Iron—Continued activity is reported in all departments and prices are strong throughout. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d. @ 8 2 6
" Common	" @ 5 7 6
Staff. Bl'k Sheet, singles	" @ 7 10 0
Welsh Bars (f.o.b. Wales)	4 17 6 @ 5 0 0

Tin—The volume of business has been large, but prices have varied to a moderate extent only. Straits quoted at £102 @ £102. 10/, spot, and £102. 15/ @ £103 for three months' futures.

Copper—The market quiet, and prices without material change. Chili Bars, £78, spot, and £78. 10/, three months' futures. Best Selected, £81. 10/.

Lead—Prices have been irregular and the market is still unsettled. Soft Spanish, £13. 7/6.

Spelter—A moderate business in this metal and prices without material change. Silesian, ordinary, £18. 17/6.

Slag Paving Stones—For some time past a number of slag paving stones have been undergoing a severe test under the heavy traffic of Broadway at the corner of Reade street. These paving blocks were made at Catasauqua, Pa., under the patents of Martin V. B. Steinmetz, of 115 Broadway. The cinder as it flows from the blast furnace is run with a ladle from which it is poured into a series of molds placed on an endless conveyer which carries them to air-tight annealing ovens in which they are allowed to cool gradually. Tests of the blocks made by the Department of of Public Works showed crushing strength of 9,674, 12,161, 12,100 and 11,806 pounds respectively in four different samples.

The inventor claims that he can produce these paving blocks at about 1 cent a piece, while granite blocks cost from 7 to 8 cents a piece. While the latter polish under heavy traffic, the slag blocks wear rough. The cost of the plant is relatively small.

WEST INDIES.

PORT OF SPAIN, TRINIDAD, September 28, 1888.—*Asphaltum*.—A brisk export demand has prevailed at \$14.04 per ton f.o.b., including the export duty for boiled, and \$6.84 crude. There have been exported from the island, so far this year, 41,372 tons, as compared with 32,681 last year, and 30,450 in 1886. *Exchange*, 90 days' sight, on London, \$4.80 @ \$4.86.—*E. P. Masson*.

BRAZIL.

PARA, October 26, 1888.—*India Rubber*.—There is for the moment hardly any unsold stock on hand.—*Per cable direct*.

EAST INDIES.

COLOMBO, CEYLON, September 20, 1888.—*Plumbago*.—Our market has weakened somewhat; we quote at the close Large Lumps, in rupees per ton, 145 @ 170; Ordinary Lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 65. Shipments since October 1 have been as follows: To England, 74,042 cwt.; to Marseilles, 38; to Trieste, 532; to Hamburg, 12,594; to Antwerp, 6243; to Bremen, 2012; to India, 82, and to the United States, 140,469, together 236,003, against last year, 281,158; in 1886: 188,647, and in 1885: 192,192 cwt. *Coir Yarn*, Nos. 1 to 4 per cwt., 7 @ 12 rupees. *Ebony*.—Some sales have been effected at 85.50 rupees per ton. *Exchange*, six months' sight, on London, 1/5 3-32.—*Volkart Brothers*, represented by Mr. John W. Greene, 82 Wall street, New York.

MANILA, October 22, 1888.—*Hemp*.—Has been inactive and may be quoted nominally \$11 per picul, against \$9.50 same date last year, equaling per ton, cost and freight, £37. 7/6, against £33. 17/6. Clearances for the United States since last cable, 9000 bales, against 12,000 same time last year; since January 1, 172,000, against 190,000; loading for ditto, 53,000, against 45,000. Cleared for England since January 1, 283,000 bales, against 183,000; loading for ditto, 2000, against none. Cleared for other countries, 59,000, against 34,000. Receipts at all ports since last cable, 9000, against 27,000; ditto since January 1, 515,000 bales, against 431,000 in 1887 and 329,000 in 1886. *Freight*, \$6, against \$5.50; *Exchange*, six months' sight, 3/8%, against 3/8%.—*Ker & Co. to Mr. Charles Nordhaus*, their agent, 89 Water street, New York, per cable direct.

PENANG, September 19, 1888.—*Tin*.—During the fortnight the receipts amounted to 14,500 piculs, of which Europeans bought 8500 and Chinese 6000. The market, under the influence of London cable fluctuations, improved from \$35.90 per picul to \$38.85, receded to \$36.90, and winds up at \$37.35, at which latter figure Chinamen bought. Previously Europeans purchased at \$38 and Chinese at \$38.30.—*Schmidt, Kustermann & Co.*

SPAIN

BILBAO, October 13, 1888.—*Metals*.—As per official returns shipments of Ores and Metals from Spain during the first seven months were as follows:

	1886.	1887.	1888.
	Tons.	Tons.	Tons.
Calamine.....	18,675	19,849	19,770
Pyrites.....	416,931	470,230	494,348
Iron Ore.....	2,566,609	3,159,987	2,743,582
Pig Iron.....	35,655	72,774	41,640
Precipitate.....	15,718	16,409	15,745
Quicksilver.....	519	1,105	865
Pig Lead.....	62,565	77,037	73,092

Totals... 3,116,672 3,817,391 3,389,042

The foregoing table shows that with the exception of Pyrites there has so far been a decrease in every item. *Iron Ore* in our own market remains in good position; it would be more active still but for the scarcity of steamers, which keeps some crops idle. We quote:

Rubios, 7/ @ 7/3, and Campanil, 8/ @ 8/3. Shipments thence so far, 2,960,883 tons, against 3,476,257 tons last year. Of *Pig Iron* 2100 tons went to Italy this week and 340 tons were shipped coastwise. The Barcelona International Exhibition proves such a success that it is to last till December 31.—*Bilbao Marítimo y Comercial*.

AUSTRALIA.

MELBOURNE, Oct. 4, 1888.—*Iron*.—Importers have tried to raise prices, but so far in vain; the market is well sustained and the tendency rather upward than downward. We quote today: Galvanized Iron, £17. 10/-; Fence Wire, £9. 10/-, and Iron, £6. 15/-. Fortnight's *Tin* shipments were 375 tons from the mainland and Tasmania.—*Per cable from Europe*.

GERMANY.

HAMBURG, October 20, 1888.—*Iron*.—The position of *Pig Iron* has gradually improved inasmuch as in spite of a slightly increased production stocks decreased 400 tons in August, while in July they had increased 11,000 tons in Rhenish-Westphalia. The orders received for Spiegel partially extend into the first quarter of 1889; the quotation remains steady, 53 marks per ton for 12 % Manganese. This barely covers cost of production; a good demand continues to prevail. *Forge Pig* has also been in better request, but at not very remunerative rates, Siegen selling good quality at 47 @ 48 marks per ton, but syndicate clings to 50 marks. Foundry *Pig* has been raised 2 marks per ton in consequence of the extraordinary demand for the same. *Bessemer Pig* has been raised 1 mark. The quotation for Luxembourg White is 37.15 marks; for Gray, 42.40; English *Bessemer* has declined 2/ @ 44/6 for mixed lots on the West Coast. Merchant *Iron* has been in diminished demand. Beams are as lively as ever; Hoop *Iron* is a little more so, yet it sells very low. The inquiry for Boiler Plates, instead of abating, on the contrary is even more pressing and general. Thin Sheets have been looking up slightly too. There are indications of an impending revival in the Wire branch generally. Machine shops and foundries continue doing well, so much so that the latter are about to raise their prices. Car works are very busy. The quotations are as follows at the works: Merchant *Iron*, 125 @ 127.50; Boiler Plates, 170; Tank Sheets, 150; Steel Sheets, 160; Car Wheels, 315; Loose Axles, 230; Hoops, Steel, 215 @ 230; Steel Rails, 115. Prospects for the renewal of the International Steel Rail Syndicate are even worse now than before. Advices from Upper Silesia in every branch of the *Iron* trade remain of the most encouraging kind. *Metals*.—Lead is firm in this city, and both Copper and Spelter are steady.—*Borsenhalle*.

Legal Decisions

CARRIER AS WAREHOUSEMAN.

T. forwarded tin by a carrier, and the bill of lading provided that the carrier should not be liable for loss by pirates, robbers, thieves, &c., whether such perils or things arise from the negligence, default, or error of judgment of the pilot, master, mariners, engineers, stevedores, agents, or other persons in the service of the shipowner, and occur before, during the voyage, or at the port of discharge. The ship arrived on the 25th of November, and notice of arrival was given the consigners the same day; the goods were discharged on the 27th of November, but were not removed from the wharf until November 29, when it was discovered that a large part of the tin had been stolen. The wharf was the private wharf of the carrier, and it did not permit any removal of goods unless a receipt was given. In this case, however, no receipt was given. T. sued for his loss, and the trial court decided 1, that the carrier was liable as a carrier; 2, and, if not, it was liable as a warehouseman. The case—*Tarbell vs. Royal Exchange Shipping Company, Limited*—was carried, after a reversal by the general term, to the Court of Appeals of New York, where the plaintiff finally succeeded. Judge Andrews, in the opinion, said: "1. The company had ceased to be a carrier, as they had given notice of arrival, had discharged the goods, and there was sufficient time to remove them. 2. The tin was taken away

from the wharf through the negligence of the carrier, who then was a warehouseman, and this negligence was so gross that it was liable for the loss. 3. The exemption of the carrier from loss by theft cannot be made available to relieve the carrier when he becomes a warehouseman."

INTEREST.

A promissory note provided for "interest from this date (date of the note) at the rate of 8 per cent. per annum, payable as per five interest notes hereto attached." The note was sued upon, and it was claimed that this declared rate of interest, 8 per cent., should be continued even after the maturity of the note. The legal rate of interest was 7 per cent., and the court would not allow more than that rate from the maturity of the note. In this case—*Sherwood vs. Moore*—on the appeal to the United States Circuit Court, Northern District of Georgia, the judgment below was affirmed. Judge Newman, in the opinion, said: "It may be considered as settled, I think, in the Federal courts, controlled as they are by the decisions of the Supreme Court of the United States, that if a conventional rate of interest higher than the ordinary legal rate is stated in a promissory note, such higher rate will not be allowed beyond the maturity of the paper, unless the terms of the instrument itself extend it beyond maturity. There is a qualification, however, to this ruling by the Supreme Court—namely, that the local law of the State will control—and it is claimed here by plaintiff's counsel that a different rule has been established in Georgia. I do not construe the decisions of this State as he does on this question, and am of the opinion that only the legal rate of interest can be allowed here. The presumption of the law was that this note would be paid at maturity. Such must be held to have been the expectation of the parties. An implication will not arise when, in the absence of evidence, it must be based upon a presumption which does not exist. A contract to pay a higher rate of interest than the ordinary legal rate will not be extended beyond its term. If it is desired that the indebtedness shall bear such higher rate of interest beyond maturity, the contract should provide for it. In my opinion, in this case interest at the rate of 8 per cent. per annum ceased at the maturity of the note, and judgment must be entered for interest at the rate of 7 per cent., the legal rate, from the maturity of the note."

A gang of men were repairing the iron truss bridge which spans the Big Muddy River, in Illinois, on Tuesday, and an order was given to loosen a girder, one of the main supports. One turn of the wrench swung the bridge out of plumb, and the vast mass dropped to the water, 50 feet below. The bridge was the largest one of the kind in the State—170 feet in the clear.

Alex. Laughlin & Co., engineers and contractors, Wade Building, Cleveland, Ohio, have opened a branch office at Knoxville, Tenn., under the management of Evan Jones.

The Nordyke & Marmon Company, of Indianapolis, Ind., are filling an order for a small flour mill, ordered by an Englishman. It is to be located at the gold fields near Natal, South Africa. It will be driven by a large American windmill, that being the only available power in that far-away clime, and will be shipped via New York, Liverpool and Cape Horn to Natal, and then by wagon for about 300 miles to destination.

Hardware.

During the past week there has been a perceptible diminution in the volume of business, which is owing in good part to the fact that it is the closing week of the month, as well as to the increased attention which is being given to politics. In trade matters there is little new or important to record, though some changes in price have been made, and others of importance are being considered. The condition throughout the country is regarded as very satisfactory.

Cut Nails.

The New York market in Cut Nails is very quiet, few sales of any consequence being made, the basis remaining \$1.80 @ \$1.90 for carload lots on dock, and \$1.90 @ \$2.00 in small lots from store. Considering the fact that Nails would not net more than \$1.65 @ \$1.70 at Wheeling for sales over the greater territory east of the Allegheny Mountains, Eastern manufacturers attach little importance to possible threats of invasion. We understand that the consummation of the Western Cut Nail Association is dependent upon the consent of one manufacturer, who has just returned from Europe.

Barb Wire.

The market in this city is affected, in sympathy with the low prices and weak tone of the Western market, and prices are slightly lower. As a general quotation for Four-Point Galvanized, 3.55 cents to 3.6 cents may be named, with concessions for carload lots. Reports from the West indicate that low quotations on Barb Wire are being made, 3.35 cents for Galvanized and 2.75 cents for Painted being named on car lots. Staples, plain, are quoted at as low as 2.70 cents, and Galvanized at 3.30 to 3.35 cents, free on board cars at factory. It is to be observed that the usual difference between Painted and Galvanized Wire is not in all cases observed, and that Staples are also offered at low prices.

Miscellaneous Prices.

J. F. Wollensak, Chicago, Ill., makes the following quotations on his Transom Lifters and other goods:

Transom Lifters.	Discount.
Bronzed Iron, class 3 and 4.	50 %
Bronze Metal, class 3 and 4.	25 %
Brass, class 3 and 4.	35 %
Crown and Star.	50 %
Eagle and Shield.	50 %
Skylight Lifters.	35 %
Sash Centers.	50 & 10 %
Letter Boxes.	25 & 10 %
Tinned Malleable Iron Door Keys.	50 & 10 %

The following are revised prices of tools manufactured by W. G. Avery Mfg. Company, Cleveland, Ohio:

	Discount.
Saw-Set and Punch.	30 & 5 %
Revolving Punch.	30 & 10 %
Bevel and Square.	30 & 10 %
Bevel Protractor.	30 %

Jewett & Leonard, Grafton, Mass., manufacture the Champion Horse and Cattle Cleaner in two styles, one of which has a scalloped edge and is designed for long-haired heavy-coated horses. The other has a smooth edge for sensitive or clipped horses. These Cleaners are sold to the retail trade at \$2.75 per dozen.

The Moore Mfg. and Foundry Company, Milwaukee, Wis., issue under date November 1, the following discount sheet: Terms, 60 days or 3 per cent. discount for cash in 10 days, goods f.o.b Milwaukee or Chicago:

	Discount.
"Acme" Barn-Door Rollers.	55 %
Baggage Car-Door Hangers.	33 1/2 %
Brackets, for Rail.	25 %
Carriers, for Hand Hoists.	20 %
Ceiling or End Pulleys.	40 %
Chain, Long Haul.	25 %
"Climax" Barn-Door Hangers.	55 %

Vises, with Offset Jaws.	20 %
"Wild West" Door Hangers.	45 %
Wood Track Barn-Door Hangers.	55 %
"Zenith" Barn-Door Hangers.	55 %

L. M. Devore, Freeport, Ill., manufacturer of the New Idea Curry Combs, quotes them at the following prices. Terms, 30 days, with a discount of 2 per cent. for cash in 10 days:

	Per doz.
No. 1—Flexible Back, Russet Leather.	\$3.00
No. 2— " " Patent Leather.	2.50
No. 3— " " Sharp Tooth.	2.25

James L. Haven Company, Cincinnati, Ohio, announce the following special prices, the pages being those in their discount index No. 123:

Page.	
No. 6 Axle Pulleys, 2 inch, per doz.	\$0.20
4, Bedstead Fasteners, per lb.	.03
5, Tire Drills, No. 2, per doz.	15.00
6, Chain Pump Chain, no button, per lb.	.04 1/2
6, " " " with " "	.05
6, Wood Chain Pump, curbs complete, per doz.	13.75
6, Wood Chain Pump, curbs bolted, per doz.	16.75
6, Wood Chain Pump, curbs, no iron-work, per doz.	8.75
8, Dog Irons, per lb.	.02
9, Grindstone Fixtures, No. 25, per doz.	2.60
9, " " " No. 27, " "	2.80
10, Ox Shoes, per lb.	.05 1/2
10, Tailor Irons, per lb.	.04 1/2
10, Plow Clevises, per lb.	.04 1/2
11, Stove-Lid Lifters, off net list.	10 %
13, Corn Shellers, Eagle, each.	5.50
13, " " " I X L, " "	5.25

The Ammunition Association have recently held several meetings, in which matters connected with their organization have been under consideration, with a view to determining the best methods to be adopted to correct the irregularities which have recently existed. No decision has yet been reached, and it remains to be seen what changes, more or less radical, in the existing system it will be deemed advisable to make.

The manufacturers of Wagon and Carriage Springs are in session, and the question of prices is receiving attention. It is understood that the steel used in making these goods has been withdrawn from the combination which has heretofore regulated its price, and that materially lower quotations are made on it. It is thought probably this may have some effect on the prices of Springs, but on this point at the time of writing no definite decision has been reached.

An important meeting of the manufacturers of Nuts was held at Buffalo, N. Y., October 26, all of the members of the association being present. As stated below, a slight advance in prices was made, and action was also taken regulating the prices of Hexagon Nuts, which have recently been in open market. The revised quotations are as follows, terms 60 days or 2 per cent discount for cash:

	Off list.
Square Nuts, Plain, Cold Punched.	5.4¢
Square Nuts, Plain, Hot Pressed.	5.4¢
Hexagon Nuts, Plain, Cold Punched.	5.5¢
Hexagon Nuts, Plain, Hot Pressed.	5.9¢
Square or Hexagon C. T. R.	5.2¢

A slight discount for quantity purchased during the balance of the year was also determined upon. Deliveries remain as before.

The Sash Weights of the T. B. Harkins Foundry Company, Bristol, Pa., in carload lots delivered in New York are \$23 per ton. They are made on a molding machine of Mr. Harkins' invention, and their regularity and smoothness of finish are points made in regard to them.

A. J. Phillips & Sons, Fenton, Mich., have put on the market several new Snow Shovels for the present season. Their No. 20 is to meet the demand for a strong and durable article of greater capacity than their other Shovels, and has a sharp ice-cutting malleable iron top, and is put together by an improved method. Their No. 22 is made after the pattern of their No. 2, and is intended to take the place of their old No. 3 as an extra cheap Shovel. They are also introducing a new fancy toy Shovel, which is described as handsomely plated, stenciled and varnished and a plain toy Shovel for children. In addition to these goods they are making a special Shovel of the Bishop pattern for New England trade. The following are the prices on their line of Snow Shovels:

	Per doz.
No. 1, long handle.	\$2.00
No. 1, long or short D handle.	2.20
No. 2, long handle.	1.90
No. 2, long or short D handle.	2.10
No. 3, long handle.	1.60
No. 20, Ice Cutting Tip.	3.00
No. 20, Bishop pattern.	3.00
No. 20, special.	2.75
No. 22, Iron Tip.	1.85
Boys' Shovels.	1.50
Boys' Shovels, D handles.	1.70
Plain Toy Shovels.	1.50
Fancy Toy Shovels.	2.00
Single Snow Scrapers.	2.25
Double Snow Scrapers.	2.75

Their circulars also represent patent Double Scrapers and Single Scrapers, both of which are furnished with Steel Shovels. The Double Scraper is made to push or pull.

F. S. Dangerfield, Auburn, N. Y., quotes his Igniting Match Box at \$1.50 per dozen, with Cigar Clippers \$2.00, delivered.

Postal Package Company, Baltimore, Md., issue a circular, October 10, giving prices on their Perfect Postal Packages in lots of 100 to 1000, mentioning a discount of 30 per cent.

•Items.

The Hardware Merchants' and Manufacturers' Association of Philadelphia opened their new rooms in the Drexel Building on Tuesday evening, October 16. The meeting was called to order at 6 o'clock, and after the routine of business was disposed of the members, 23 in number, adjourned to the Bullitt Building, where an excellent dinner, lasting nearly four hours, was enjoyed. The occasion is referred to as one that brought out much talent in connection with the toasts, songs and other exercises. The association was organized through the instrumentality of Samuel Disston, of Henry Disston & Sons, on the occasion of a supper given to members of the trade at his residence, February 6, 1886, and has held meetings regularly each month since that time. These meetings have been productive of a warm and friendly feeling among the members, in addition to the correction of some abuses that had existed in the trade. Its present officers have held their positions since its organization and are as follows: W. J. Lloyd, president; Fayette R. Plumb, vice-president, and E. D. Eyre, secretary and treasurer. There is also a standing executive and grievance committee. The association contemplates having a complete library of price lists of Hardware manufacturers of the country, and we take pleasure in mentioning to manufacturers the fact that

the association desires that the latest editions be sent to their rooms, 912 Drexel Building, Philadelphia.

A. W. Kingsland, who was for many years connected with the Northwestern Horse Nail Company, of Chicago, and in that capacity became well known to the Hardware trade of the West, has been appointed general agent of the Au Sable Horse Nail Company, of New York. He has opened an office at 142 Lake street, Chicago, and will carry a stock of Nails, from which prompt shipments can be made to buyers in the section tributary to that city.

The Hiram Holt Company, E. Wilton, Maine, manufacturers of the Lightning Hay Knives, have completed their new shops, and since the middle of September have been running them overtime. These shops are said to be exceptionally fine and complete, and are the only ones, we believe, run exclusively in the production of Hay Knives. The demand for the Lightning Hay Knife has been unusual this season, and the stock of finished goods on hand at the time of the fire was exhausted sooner than the company expected. Hence there was some unavoidable delay in filling orders. The company are now, however, in condition to respond promptly to all demands. In this connection the company advise us that they have been informed that Hay Knives branded Lightning Pattern are being quoted among jobbers, and desire it to be understood that Lightning as applied to Hay Knives is their exclusive property, and as a trade-mark has been duly registered, so that the use of this name by other parties will promptly be proceeded against according to the law relating to trade-marks.

The Hardware Trade Cleveland and Thurman Association, with headquarters at 27 Chambers street, participated in the business men's parade last Saturday, and the Harrison and Morton Hardware Club are making arrangements for the parade next Saturday.

The Moore Mfg. and Foundry Company have removed their office and wareroom from 51 and 53 Franklin street, Chicago, to their works at Fowler and Nineteenth streets, Milwaukee, Wis. They have just put their new plant in operation. It consists of a completely equipped machine shop, foundry, forging rooms, and japanning and annealing ovens. They will manufacture their own line of Hardware Specialties and will compete for orders for gray iron castings, light machine work, forging and japanning. They have just issued a 50-page catalogue devoted to their line of goods. In its pages they illustrate and describe off-set jaw vises, Wild West and Climax door hangers, railroad hangers, rails and fittings for hangers, Novelty tackle blocks, hay-fork pulleys, log binders, carriers for hand-hoist and differential blocks, differential pulley blocks, portable and stationary hand-hoists, anti-friction sash pulleys, sliding-door sheaves, dumb waiter pulleys, door rollers for heavy doors, street-car door hangers, wood track hangers, Acme barn door rollers, detachable log haul chains, endless chains, or links for chains, ice elevator chains, &c. Complete price lists accompany the descriptions of the various articles included in the contents. The catalogue is well printed on good paper and is of convenient size.

Sidney Shepard & Co., Buffalo, N. Y., have issued a new catalogue of goods manufactured and for sale by them. It relates to Stamped Ware, Deep and Shallow Pieced Tinware, Japanned Ware and miscellaneous goods. In the latter department are represented some of the specialties of the company. Creamery Pails and Trimmings are also represented,

as well as Coal Vases, Toilet Ware, &c. For the information of the trade a list of the goods kept in stock in addition to their manufactures is appended.

E. T. Barnum, Detroit, Mich., in his fall catalogue No. 160 illustrates a variety of Wire articles, Wire Cloth, Counter Railings, Crestings, &c., and calls attention incidentally to other articles in his line. His catalogue No. 163 is devoted to Builders' Wire and Ironwork, and relates especially to Crestings, Roof Crestings, Finials, Town Ornaments, Office Railings, Mangers, Hay Racks, &c., Stair and Balcony Railing and Wrought Iron Fences.

J. F. Wollensak, Chicago, Ill., issues a circular devoted to Electric Bell Sets. The style of box in which each set is put up is shown, and also other illustrations given representing the goods and the manner in which they can easily and efficiently be displayed.

The Herendeen Mfg. Company, Geneva, N. Y., issue a pamphlet entitled "How Shall We Heat," in which reference is made to Open Fireplaces, Hot-Air Furnaces and steam or hot-water systems. The Furman Heater, which may be used as a hot-water or steam generator, is especially referred to, and its durability and simplicity as well as its efficiency in operation alluded to.

The Hardware store of Weaver Brothers, at Downs, near Bloomington, Ill., was destroyed by fire on the 26th ult., involving a loss of \$5000.

A corporation will be formed under the style of the C. H. Gurney Company to succeed the firm of C. H. Gurney & Co., 247 Lake street, Chicago, manufacturers' agents for the sale of Hardware.

Charles A. Wright, a prominent Hardware merchant of Aurora, Ill., died on the 20th inst. He was an old citizen of that place and was universally esteemed for his many excellent qualities of head and heart.

Haff & Walbridge, 76 and 78 Leonard street, New York, issue a catalogue relating to the line of notion specialties which they manufacture. The goods are intended for the notion, stationery and Hardware and druggists' sundries trade. It includes a line of Corkscrews, Razor Strops, Thermometers, Tape Measures, Button Hooks, Match Stands, Pencil Holders, &c.

H. T. Wakeman, successor to Browning, Sissum & Co., manufacturers of Belt Hooks, Cotters, Spring Keys, D Rings, Staples and other goods in this line, will continue the business of the late firm at the old stand, 85 Chambers street, New York.

James L. Haven Company, Cincinnati, Ohio, issue a circular relating to the Little Giant Corr. Crusher in which a full description is given, with testimonials. They also issue in leaflet form illustrations of their Iron Chain Pump Curbs and Wood Chain Pump Curbs, of which list prices are also given.

Gage & Joost, 243 Water street, New York, are sole agents in the United States for Anti-Rust. This is a preparation for preventing rust on nickel-plated work, polished edges and all bright metal surfaces.

The trade will observe the advertisement of Joseph Churchyard's Sons, Buffalo, N. Y., in which they call attention to the line of Refrigerators, Ice Chests, &c., which they are manufacturing. In this departure they are putting a new line of goods on the market and are in position to take the orders of the trade for the coming season. The name of the concern is doubtless familiar to most of our readers through the reputation they have on

Bellows, and it has been facetiously remarked that they are in this departure like the man in Grimm's fable who blew hot and blew cold, as they have been blowing hot for years with their Bellows and are now blowing cold with their Refrigerators, and it is intimated that by judicious use of their different products the public should be able to maintain a comfortable temperature. With reference to their new line of goods, they claim to have a non-condensing Refrigerator, and refer to their styles as new and different from any now offered to the trade.

Haydock & Bissell announce an auction sale, November 14 and 15, at their rooms, 12 Murray street and 15 Park place, New York. The sale covers a large line of Table and Pocket Cutlery, and also goods suitable especially for holiday trade. Full particulars will be given in our next issue.

In the catalogue of the Gould Mfg. Company, Seneca Falls, N. Y., to which we referred in our last issue, there are a great many new goods represented which are deserving the attention of the trade.

The Collins-Gibbons Mfg. Company, St. Louis, Mo., issue a circular describing their Automatic Wire Straightening and Cutting Machines and the Little Giant Wire Cutter, to which we shall have occasion to refer hereafter.

The E. C. Meacham Arms Company, St. Louis, Mo., have issued a 50-page price list, October 20, in which they represent a large line of Arms, Ammunition, Sporting Goods, &c. List prices with discounts in characters are given, a key to the quotations being also furnished.

Tendencies In Trade.

Referring to the general tendencies in the trade, especially in regard to the proportion of goods purchased from manufacturers and jobbers, we have the following advices for our subscribers in different parts of the country:

Marshalltown, Iowa.—As I observe it, the character of the Hardware business is undergoing a change. I find it growing less legitimate each year in this: that Hardware is no longer a proper word to express the merchandise that so-called Hardware dealers sell. This idea applies more particularly to the larger jobbers in the Western Central States. I observe that the combined small jobber and large retailer is growing more numerous throughout the United States, and that the purchases of this class, as well as the purchases of the better retailers only, are made from the manufacturers. The larger jobbers, to meet this, are placing these other goods, doing so to maintain former volume and income. As I see it, the manufacturer is getting nearer the consumer through the afore mentioned lesser jobbers and retailers. The jobbing business is not increasing in the ratio that consumption is increasing.

Rock Island, Ill.—I have been in the trade over 20 years, and I think there are fewer jobbing houses now than in 1867. More places to buy goods, no doubt, but the larger number represent the manufacturers. The smaller jobbing houses have multiplied, in fact there are one or more in every good-sized town that supply a local trade, but we refer to the larger cities. New York has not a leading jobbing Hardware house that does not represent or is not a manufacturing concern. Were it the proper thing to do we might name many in that city and others that are out of business and none to take their places, except the manufacturer. Why is it that the manufacturers are placing in Chicago, St. Louis and other cities agencies and depots of supplies unless it is to reach the retail trade, and, if the retail trade did not support them, would they stay simply to supply jobbers, when they could reach them much more cheaply? Our theory is that the retailer will go the manufacturer first, because he knows what he is getting, and, if the goods are not what they are represented to be, he has no trouble in getting at the responsible party for damages. Secondly, because, if he wants a reliable, steady trade, he must have a good line of goods and a special line in many things, and in buying of jobbers he cannot do it, as they change so often it is impossible. The jobber buys where he can buy the cheapest and cares nothing for name or brand, except his own, and often the dealer

has made a special point in regard to certain makes of goods, and, running short, he sends his order for the make he has been selling. His jobber is "out just at this time" of those particular goods, but have "sent you something just as good or better." When his goods arrive, to his disgust, he finds the very make he has been competing against. Another very good reason why it is better to buy of the manufacturer is that your goods come to you in better shape—fewer broken packages and no shelf-worn goods. In many lines it is more convenient to the average dealer to buy of the jobber, but the best retail dealers will buy more and more of the maker of the goods, where generally there is no boxing or cartage to pay, and where with allowances for freight he will be able to put the goods in his store for the price that the jobber wants for them.

Red Wing, Minn.—Concerning retail dealers in general, who buy in small quantities only, I concede there is no tendency toward buying direct from manufacturers, as goods can be bought just as cheap from jobbers.

Detroit, Mich.—We have observed the Straub table in *The Iron Age*, but have never kept any statistics of the kind. Owing to the fact that in our specialties we carry a larger variety than the jobbers, it has always been necessary for us to buy of the manufacturers of these lines, which include Tools and Builders' Hardware. Our trade with the jobber is therefore comparatively small. In this city we find jobbers a very great convenience, however, as we can buy staple goods of them to advantage—the small difference in cost being made up by our not having to carry so large a stock.

Waterville, N. Y.—We have read the table of Messrs. Straub & Co. with much interest. We are buying more goods of the manufacturers than formerly, and, as a general thing, find it much more satisfactory than buying through the jobbers. We can usually get better prices and the goods come in much better shape—that is, better packed, less broken and soiled packages, &c. We were largely influenced to buy direct of manufacturers to protect ourselves against the jobbers, as they show great energy in drumming up the consumers' trade in this section, so we are forced to put ourselves in a position to meet them as competitors.

Greenville, Mich.—Think that we buy fully as large a per cent. of our goods of manufacturers as Messrs. Straub & Co.'s table shows, but mostly of Eastern manufacturers. We buy but little West. Think the matter stands almost like this: The manufacturers pick out the best retail trade and drum them and offer them inducements to buy, taking into consideration the prompt paying qualities, more than the size of the sale or the magnitude of the firm's business. And among prompt paying firms we think purchases will reach nearly 75 per cent., while among the smaller firms nearly 75 per cent. is bought of jobbers. That is the way it looks to us.

Bath, N. Y.—We have always preferred to buy of jobbers for the reason that we can buy in such quantities as our wants require at prices a little above the manufacturer, and if we get quantity prices of manufacturer we would feel obliged to buy in larger quantities, and the result would be an overstock of goods and unpaid bills.

Trade Topics.

A factious correspondent, signing himself "Traveler," writes us as follows:

Pardon me for writing such a cranky letter, but really I can hold myself no longer. I am not a stove founder, consequently have nothing to lose as such, but may lose my position on the road on account of my employers closing up shop if the cause of my trouble continues. You ask what it is. Simply this: the manufacturers are being driven crazy by a new fake (similar to the Bohemian Oats swindle) now practiced by the retail dealers all over the country. It is not a new trick by any means, but is being played this year for all it is worth, and plenty of the too over-anxious are always ready to bite.

"For my own use" is the trick. "O, Heavens, it is vile." The retailer writes in asking for a price on a certain stove in your catalogue saying it is for his own use and wants you to make it as low as possible. Of course it is hard to refuse a good customer an extra discount of some kind, and if you allow it once you will be surprised to find how many stoves your customers need for their own use. We have had so many letters of that kind in the past few days that I hardly think it safe for any

man living, Sullivan included, to enter our office in search of a stove or even a fire-back for his own use.

The manufacturer who sells a stove giving an extra ten "for my own use" is more to blame than the man who asks it, as it is the second law of nature (first with some) to buy everything as cheap as possible. I hope the manufacturers will break up this

Fig. 285.—Combined Stair and Elevator.

paralyzing practice and tell the festive retailer not to use so many stoves. It is expensive for coal, you know.

Arrangement of Stores.

From P. M. Church & Co., Sault de Ste. Marie, Mich., a description of whose new store we gave some time ago, we have received information in regard to their Combined Stair and Elevator, the construction of which is illustrated in Fig. 285. It is referred to as a convenient method of arranging an elevator where room is an important factor. The car, it will be observed, runs on rails placed at the side of the stairway, a counter weight balancing the platform. The power can be either a set of pulleys or a winch or crab placed up stairs so that a rope can be

Fig. 286.—Brush Rack.

attached to it. The size of the car deck best adapted for Hardware stores is probably about 4 x 5 feet, but on stairs not having a pitch of more than 30° the car may be lengthened to 7 or 9 feet, and we are advised that it will then work quite as well as far as its equilibrium is concerned. The pitch of the stairs, however, should not exceed 45°. The less pitch there is, the easier, of course, will be the operation

of the elevator. Any number of stories may be reached by this device, but it is intended to extend from the basement to the second floor. The rails are of iron and flat, planted on the stair strings. The first or inner part of the rail is $\frac{1}{4}$ inch wide by $\frac{1}{2}$ inch thick, screwed on the top of the inside of the string or carriage, and the second part is 1 inch square and screwed

on the outer top, forming a rebate on the top, in which the rollers are thus guided. This detail of the construction is illustrated, it will be observed, in Fig. 723. This arrangement is referred to as convenient and satisfactory in its working, and we are advised that a load can be lifted much more easily on this inclined plane than where the lift is direct.

From the same parties we have a description of the Brush rack shown in Fig. 286. This rack is made by cutting down a clothes-horse, using only the principal portion and suspending it with cords, pulleys and counterweights from the ceiling. For attaching samples small screw eyes are inserted in the rack, the eyes being twisted a little to one side so as to form a hook, curved so that anything can be taken off only by lifting and twisting slightly, like a whiffletree hook. When the rack is thus prepared samples of Brushes are taken and small screw eyes placed in the ends. Each Brush is marked with cost and selling price per dozen, as well as a number corresponding to the number of the box in which the stock is kept. In operation a customer calls for a Brush. The rack is pulled down to the proper level for his inspection, thus permitting him to see at a glance what he wants, examine the article and give that critical inspection so pleasant to the average buyer. The salesman knows the box number and can without trouble hand him a Brush clean and fresh from the stock. The advantages of handling Brushes in this way are referred to as obvious, and among them may be mentioned the saving of clerks' time, the elegant and effective display, saving general stock from constant handling, resulting in damage to the goods, and the ease with which samples are disposed of when the sale is completed. As a counter weight a shot bag is used, which can be loaded more or less heavily as samples increase or diminish.

A new and convenient case for the accommodation of Tacks, Nails and other goods is illustrated in Figs 287 and 288. It is the invention of W. G. Barnes, of Larabee & Barnes, Amsterdam, N. Y.

and was patented in July of the present year. Fig. 287 gives a general view of the case, while Fig. 288 shows the construction of the separate boxes which are used in it. This case is designed to furnish means whereby Tacks, Nails, Wire Brads, Staples and similar articles may be more readily handled than by the methods usually employed by Hardware dealers. The size of case as shown is as follows: Length, 35½ inches; depth, 13 inches; height, 19½ inches. The boxes, Fig. 288, are intended to be made of metal and will contain about 25 pounds. When to be filled they may be drawn out of the case

Fig. 287.—Case for Tacks, Brads, &c.

and placed in any convenient position, and the article poured into it, when the bin can be replaced in the case. The goods can obviously be taken in small or large quantities with the use of a small rake, the scale-pan being held under the bin to receive them. It will be understood that the case as shown, Fig. 287, contains two rows of receptacles, each of which is closed by a cover, which is operated as shown. In this case the upper tier is devoted to Tacks and the lower to Wire Brads, the name WIRE BRADS being visible when the lid is closed. The numbers on the under side of the covers denote the size or quality of the articles contained in the boxes under them, and may also have the cost and selling price thereon. This case is alluded to as especially adapted for the handling of Tacks in bulk, Wire Brads,

Fig. 288.—View of Box.

Horse Nails, &c., and is offered as a convenient device for this purpose. It is referred to as working exceedingly well in practice and obviating the difficulties that are usually found in managing the line of goods for which they are especially designed.

Condition of Business.

From Louisville, Ky., we have the following report under date October 27:

The Hardware trade of Louisville, Ky., for the past week has been a great improvement over the previous one. General orders are large and entirely satisfactory; this is particularly the case with shelf goods, on which the jobbers realize reasonable profits. Gunning season having arrived, Ammunition naturally forms a large part of country orders.

Shipments this week are very heavy, with many specifications left unfilled for lack of capacity to get them off. The increased demand appears to be general and betokens permanent improvement. The urgent demand for Light Sheet Iron has been relieved by the mills catching up with orders. Bar is freely offering from mills, but prices remain firm so far.

Cut Nails have again gone all to pieces; trade in them being completely demoralized by continued cuts offering and further helped downward by several speculative lots selling at ruinous prices. Overproduction is recognized as

the prime cause of the evil, but then the demand from the country has been small this fall.

Stove jobbers and foundries are having good business, the increased amount of goods going out about equaling lower scale of prices formerly prevailing.

From Fremont, Neb., we have the following advices in regard to the condition of trade and the outlook:

Small grain was not as good here as it usually is. Hence collections have been a little slow. The corn crop is good, well matured and acreage large. Collections should come in well later on. Trade is good, and I look for it to continue so until winter sets in and puts a stop to building. In short, our country here seems to be in a good and prosperous condition.

From Michigan we have the following advices in regard to trade:

While the volume of business is somewhat late in coming forward, trade on the whole is in a healthy condition. Customers, while supplying their needs, are cautious in incurring obligations, and there is a growing disposition to pay cash. Indications are good for future trade.

Recent Exports in Hardware and Related Lines.

PER BARK MYVANROY, OCTOBER 1, FOR PORT NATAL, AFRICA.

By H. W. Peabody & Co.—8 cases Sewing Machines, 31 packages Hardware, 20 packages Agricultural Implements, 50 dozen Shovels, 480 dozen Handles, 165 bundles Sash Weights, 223 packages Agricultural Implements, 87 packages Hardware, 1 case Pumps, 4 crates Churns, 8 cases Hardware, 49 packages Carriage-ware, 12 Axes, 2 cases Bolts and Nuts, 2 packages Lawn Mowers, 13 Sewing Machines, 300 pounds Nails, 120 dozen Handles, 1 case Tools.

PER BARK ROSE C., OCTOBER 9, FOR PORT NATAL, AFRICA.

By New Home Sewing Machine Company.—34 cases Sewing Machines
By Marcial & Co.—10 cases Rims, Spokes, &c., 828 pounds Nails, 2226 pounds Mule Shoes, 3498 pounds Nails.
By J. Norton & Son.—48 Plows.
By W. H. Crossman & Bro.—39 cases Plow Parts, 15 dozen Axes, 57 cases Plow Parts, 29 dozen Axes, 100 dozen Shovels.
By Arkell & Douglas.—360 Hammers, 10 dozen Axes, 16 dozen Picks, 20 dozen Handles.
By H. W. Peabody & Co.—6 dozen Handles.
By Corner Bros. & Co.—54 cases Hardware, 8 cases Agricultural Implements, 177 cases Hardware.
By Coombs, Crosby & Eddy.—22,453 pounds Coil Wire, 6 Corn Shellers, 31 dozen Plow Parts, 78 Clocks, 5 dozen Plow Parts, 176 Plows, 6 Corn Shellers, 356 dozen Handles, 1 dozen Washing Machines, 2 dozen Carpenters' Tools, 3 Corn Shellers, 20 Meat Cutters, 2 Sausage Stuffers, 6 Churns, 1 dozen Wheelbarrows, 8 dozen Wrenches, 18 Lamps, 4 dozen Axes, 27 Pumps, 19 dozen Hardware, 5 Corn Shellers, 6 Churns, 2 Sausage Stuffers, 14 dozen Wrenches, 9 Lamps, 9 dozen Axes, 1 dozen Wheelbarrows, 16 Pumps, 21 Saws, 12 dozen Hardware.

PER BARK WM. PHILLIPS, OCTOBER 11, FOR WELLINGTON, NEW ZEALAND.

By Mailler & Ducreau.—60 dozen Shovels, 300 dozen Handles, 25 cases Sewing Machines, 100 dozen Handles, 20 dozen Handles, 4 cases Saws, 2 cases Saws.
By Arkell & Douglas.—3 cases Carriage-ware, 30 pairs Rims, 2 gross Stove Polish, 5 dozen Saws, 5 dozen Hammers, 5½ dozen Wrenches, 60 pounds Hardware, 4 dozen Axes, 21 dozen Wire Goods, 4 dozen Fruit Presses, 1 dozen Lampware, 2 dozen Lampware.
By A. Field & Co.—11 Stoves, 6 dozen Stove Repairs, 1 gross Blades, 3¼ dozen Hardware, 7 sets Axes, 9 pairs Springs, 1½ dozen Tool Chests, 240 pounds Horse Nails, 3000 Bolts, 10 pairs Hardware, 1 dozen Razor Strops, 6 gross Hooks, 4 dozen Fire Sets, 4 dozen Bird Founts, 3 gross Molds, 2 dozen Tools, 3 dozen Can Openers.
By A. S. Lascelles & Co.—1 case Handles.
By H. W. Peabody & Co.—44,800 pounds Barb Wire, 5 cases Harness and Parts, 5 packages Pumps, 50 cases Hardware, 25½ pounds Castings.
By R. W. Forbes & Son.—15 packages Hardware, 12 dozen Axes, 4 packages Churns, 1 case Toys, 172 dozen Handled Axes, 21 sets Axes, 3 dozen Wringers, 14 dozen Forks, 18 dozen Spade Handles, 63 dozen Handled Axes, 200 papers Lining Nails, 14 dozen Wringers, 3 packages Carriage Hardware, 7 packages Hardware, ¼ dozen Wheel Jacks, 355 pounds Tire Bolts, 9 Lawn Mowers, ¼ gross Rat Traps, 6 dozen Hammers, 1 case

Stamped-ware, 1 case Kitchen-ware, 17 packages Hardware, 8 dozen Hammers, 5 gross Blacking, 5 gross Fruit Jars, 1 case Hardware, 15 dozen Spade Handles, 48 packages Carriage Woodwork, 9 packages Agricultural Implements.

By Coombs, Crosby & Eddy.—6 dozen Shovels, 2 cases Slates, 1 Lathe, 137 pounds Oil Stone, 6 dozen Traps, 6000 feet Safety Fuse.
By W. H. Crossman & Bro.—5 cases Carpenters' Tools, 1 case Mower Parts, 3 Drilling Machines, 1 Washer, 124 pounds Rubber Springs, 40 dozen Handles, 2 cases Pumps, 6 dozen Mouse Traps, 3 dozen Dashers, 872 pounds Nails, 6 gross Wicks, 3 dozen Grindstone Fittings, 255 pounds Tacks, 12 dozen Scythe Stones, 1½ dozen Wringers, 3360 pounds Axle Grease, 13 Stoves, 550 pounds Horse Nails, 1250 pounds Horse Nails, 3 Blowers, ¼ dozen Mangles, 287 pounds Rivets, 2 dozen Bush Hooks, 3 dozen Grindstone Fittings, 2 cases Harness, 25 dozen Axes, 15 cases Hardware, 3 cases Hardware, 7 cases Hardware, 6 cases Carriage-ware, 1 case Tire Benders, 2 barrels Pipe Fittings, 1 case Hardware.

By Woodhouse & Stertz.—2584 pounds Axes.
By New Haven Clock Company.—84 boxes Clocks.

By F. B. Wheeler & Co.—18 sets Wheels.
By Welch & Lea.—4 cases Iron Bolts.
By Plumb, Burdick & Barnard.—1370 pounds Iron Bolts.

By Meriden Britannia Company.—6 packages Plated-ware.

By Singer Mfg. Company.—555 cases Sewing Machines.

By Joseph Dixon Crucible Company.—92 pounds Lead Pencils.

By Russell & Erwin Mfg. Company.—9 cases Hardware.

By W. & B. Douglas.—3 packages Pumps.

By Ansonia Clock Company.—46 boxes Clocks.

By Goulds Mfg. Company.—1330 pounds Pumps.

PER SHIP JOAQUIN, OCTOBER 13, 1888, FOR SYDNEY, N. S. W.

By J. L. Mott Iron Works.—46,202 pounds Cast Iron Stoves.

By W. K. Freeman.—3162 pounds Tackle Blocks, 24 bundles Lamp Goods, 75 dozen Edge Tools, 7 packages Hardware, 2 cases Saws, 165 pounds Drills, 12,557 pounds Axes, 22 crates Churns.

By F. B. Wheeler & Co.—216 dozen Handles, 4 dozen Axes, 6 cases Boys' Wagons, 51 packages Clocks, 67 sets Harness.

By Collins Company.—256 dozen Edge Tools, 80 dozen Picks, 100 dozen Edge Tools.

By Winchester Repeating Arms Company.—250 Guns, 85 sets Tools, 50,000 Metallic Cartridges, 10,000 Metallic Cartridges, 300,000 Primers, 24,000 Metallic Cartridges, 3000 Shells, 25 Guns, 7000 Metallic Cartridges.

By H. W. Peabody & Co.—15 cases Typewriters, 44,810 pounds Fence Wire.

By Seth Thomas Clock Company.—4492 Clocks.

By C. E. Renshaw.—21,343 pounds Axle Grease.

By Ansonia Clock Company.—25 boxes Clocks, 115 boxes Clocks.

New Haven Clock Company.—28 pounds Clocks.

By E. W. Harrison.—2 cases Steel Tools.

By Russell & Erwin Mfg. Company.—15 cases Hardware.

By John A. Ten Eyck.—4 cases Carriage Springs.

By Barber & Co.—915 pounds Iron Castings.

By A. Field & Co.—5 gross Hammers.

By Simpson, Hall, Miller & Co.—210 pounds Plated-ware.

By Fairbanks & Co.—2289 pounds Scales.

By W. & B. Douglas.—11 packages Pumps.

By Rogers, Smith & Co.—1 box Plated-ware.

By Healy & Earl.—5 cases Grain Mills, 1 Hay Press, 13 cases Wood-Working Machinery, 5 boxes Emery Wheels, 1 box Pumps, 2 boxes Saws.

By Meriden Britannia Company.—20 boxes Plated-ware.

By Arnold, Cheney & Co.—1 case Wheels, 11 cases Carriage Hardware, 18 cases Wheels, 4 cases Carriage Springs, 52 cases Axes, 7 cases Wagons, 8 cases Carriage Hardware, 37 cases Axes, 8 cases Saw Mills, 7 cases Hoes, &c., 17 cases Handles, 9 cases Iron Castings.

By Ilsey, Doubleday & Co.—6 gross Egg Beaters, 10 gross Can Openers, 1½ dozen Banks, 1 case Toys, 9 cases Castings, 18½ gross Axle Grease, 6 dozen Step-Ladders, 41 Stencils, 448 pounds Pumice Stone, 4 dozen Paint Brushes, 130 pounds Glue, 2½ gross Axle Grease.

By R. W. Forbes & Son.—32,149 pieces Roofing Slate, 13 boxes Sewing Machines, 50 sets Harness, 1 Carriage, 2 cases Carriage Hardware, 6 packages Machinery, 1 box Plated-ware, 1 case Toys, 2 cases Hardware, 22 packages Agricultural Implements, 11 packages Corn Shellers, 14 packages Machinery, 7 packages Guns and Parts.

Science vs. Familiar Things.

BY KNARF.

What is more familiar to us than stoves, and yet how unfamiliar are the most familiar things. For instance, the writer remembers, in his boyhood days, the kitchen stove, and that a large iron pot always stood on the left-hand back griddle hole, with water in; so there could have been no reservoir to the stove. The construction was not of the elevated oven type, nor of the crank stove, where the lids were revolved at pleasure over the fire, by the aid of a crank and cog-wheel working in corresponding cogs on the underside of the top of the stove, which was necessarily circular. My memory of this stove was contemporary with about 1858 or '59. We had a "Dutch oven" built in connection with the chimney, with the feed door, also the oven door, built to open into the kitchen. This oven I never saw used, and why it was built I never knew. The house was built about 1852, and that must certainly have been after people were dependent upon a tin reflecting oven, before an open fireplace. I know some of our neighbors' houses had the same "Dutch oven" arrangement in them. The "Dutch oven" of that day, was similar to the bakers' oven of the present time. This, with an open fireplace for wood, took nearly all the space on one side of a large kitchen, as it was one continuous brick front, the oven flue merging into the fireplace flue before it reached the top of the chimney. But to return to the stove; though I can see that stove standing in our kitchen, black, with no attempt at ornamentation or nickel; and, though it burned wood—and a good deal of it—I cannot tell the make, nor number, nor date of patent.

I was not far enough along in stoveology to be interested in these matters. I know about this time my father tired of changing this stove from the kitchen to the woodshed, in summer, and from the woodshed to the kitchen again in the fall. I surmise, too, that the stove was getting the worse for wear; so it was not brought back into the kitchen one fall, but a new one took its place. I think my mother preferred the old stove to cook in. And so I was in the same house for years with this cook stove. I can tell nothing in particular about it.

What science does the average husband try harder to learn than that of putting up stoves? Each fall presents the same question, and each time he tackles the problem fearlessly, and it usually results in a stove man being called. The same pipe was used last year, when the stove stood just where you want it again this year; this pipe has shrunk and won't fill the bill, though it was all put away together in the spring and hasn't been touched since until you try to put it together and make it reach. Then, too, after you have tried to put all the big ends of the pipe together, and then all the small ends together, you feel so mean, and yet somewhat relieved, to see how easily the pipe fits together, and stretches the required length in the skillful hands of a tinner.

The same question comes up in the household each fall: How are we going to arrange for heating this winter? The self-feed base-heater is not suitable for early fall or late spring, and it is such a nuisance to burn wood for a while and then have to change to a coal stove. Four stoves are necessary for the safe conduct of a family through each year. A gasoline stove

for cooking in summer and a cook stove for winter. A wood heating stove for fall and spring and a coal stove for winter. Those who have furnace, grate and gas stove are not troubled as other men are.

The stove question is a troublesome one to any family in moderate circumstances, whether it be the getting of a cook stove or a heater. After the question that there has to be a new stove, by the inability of the old one longer to fill the requirements of the family, the next question is, "What kind?" The neighbors' stoves are brought up for comparison, and the beauty and utility of Mrs. Smith's is compared with that of Mrs. Jones's. The wife takes occasion next day to "look around" among the stove stores, and after being shown the assortment in three or four of them, becomes so bewildered in styles and prices, and where she saw this one, or that one, she can't tell. The daughter takes a look, and comes home with her mind made up as to just the one she would buy. Some evening, a few days later, the old gentleman takes the matter in hand, and is going to have an end of this foolishness. Before he reaches home he has ordered a stove, which proves to be just the one his wife and daughter "would not have under any consideration" when they were looking. The rumpus ensuing is a stayer; in fact, it causes unpleasantness in the family until it is worn out. The science displayed by the salesman in working off the old familiar thing on the husband—the stove that has been on his floor for more than a year—is a standing joke in the store for a long time.

A most unpleasant feature of the stove trade over a large section of our beautiful country is the prominent part "second-hand stoves" play in closing a bargain for a new stove. Horse trading is not to be compared to it. Broken down, foundered, spavined stoves are brought to view, just as good as the day they bought them, splendid heaters or cooks, as the case may be, and the only reason they want to trade is because it is too large or too small, too high to put coal in, or it takes up too much room in the kitchen. But trade we have to, or some one else will, and make the sale of the new stove. And so the merchant's profits on his new stove, or, perhaps, more than the profits, go in the second-hand store. A lease is generally taken for the balance of the payment, the money to be paid in installments, making the final payment due in about six months. Oh! the familiar things are pleasant to deal in. Sometimes we think there is a tendency toward less nickel in buyers' minds, and yet, however strongly they object to a fancy stove, the appointments of this class of goods are usually so much better than the plainer that they choose the nickeled ones. The fall trade on heaters bids to be light, especially in hard-coal base-burners. The high-priced coal is almost prohibitory for the \$1.25 or \$1.50 a day laborer; \$7.50 and \$8 coal is beyond their reach. Wood they can buy by the load as their needs be without feeling it so much. Wood stoves of small size and little money are in demand, just to use until coal comes down, which each winter they hope it will do, before the next season. How little idea we have of the grinding poverty of the day laborer, the man that depends upon muscle instead of brain for a livelihood. Accident or sickness incurs a debt that takes months to pay, and many waste the best years of their lives in trying to make both ends meet. Yet this class of people are the real consumers, the ones the country depends upon to use its products. There is a growing demand among the thinking class for burners that will successfully use oil for fuel, both for cooking and heating. A number of this class of inventions have been put upon the market, but have not filled the place.

Some are too expensive or complicated; they are not economical in fuel; they clog up or have to be run in connection with a steam jet. The matter is interesting many minds, and before long some one will make a fortune who gets the right thing for this purpose.

The fact of smaller bills of stoves on first orders, and a more frequent ordering as stocks or assortments become broken, seems to be the order of the day. While stove men try to look at it in a favorable light, it is an open secret they are disappointed. There seems to have been a hope of an increase over last year's business, which, so far, has not been realized. While we hear of large crops through the press, there are few sections West, North or South that are not short on some staple. Where there is abundance of everything, old debts are making the farmers feel poor. There is, no doubt, a change taking place in the manner of doing business, which is wholly the outcome of the necessity of the times. One favorable feature in this perceptible change is a gradual nearing to cash. The stove manufacturers, with large profits, years ago could afford to give long time. The merchant on this long time could afford to sell stoves on leases or monthly payments, until now a cash customer for a stove is a rarity. The stove makers have talked the matter of shortening the time on stoves, but in some way do not see their way clear to do it. A shortening of time from first hands would necessitate a corresponding curtailing of liberality on the part of the retailer, which, no doubt, would reduce the number of stoves retailed. The laboring class who break up stoves in moving and buy new ones, or another class who are higher in the dollars and cents and trade off a good stove for one of newer style, are not able to pay cash for a stove.

What the reduction in stove sales would be if every one kept their stove as long as it was serviceable, instead of trading it off simply on account of style, will probably never be determined. There is no doubt but the change in patterns of stoves, especially heating stoves, during the last three or four years, has acted like a tonic to the retail trade. To keep up with the styles of stoves, and have one as good and elaborate as the neighbor, has stimulated the trade, and now, like a sick person, the trade has had a relapse because the tonic is no longer taken, or, if taken, is losing its effect. It is not an unusual thing in some sections of the country to see from 20 to 100 second-handed heaters in stock. Each of these second-hand stoves represents at least the profit of the new stove which took its place, if not more than the profit. A large part of these stoves have been carried over from last year; they had to be put away for the summer, brought out again this fall, polished again, and in many cases will be sold for less than cost to close them out. Is it any wonder that retailers are not placing large orders? The query is pertinent, Why do you trade in second-hand stoves? Because if you do not offer the same inducements as your competitors you will be badly left. They will do such business, and you must. Second-hand cook stoves are generally in demand, being fewer of them on the market. A cook stove is good until it is worn out, as styles change less, and even with more nickel on and swell doors, kickers and pie-removers, the old cook stove remains in the kitchen, and is not intended for show. A cook stove that is a "good baker" is so highly prized it is used until the last minute. So, while the cook stove is an old familiar thing, the heater is unfamiliar. New ornaments, jewels, nickel, new shapes and styles are found in our houses each year, and the Morning Glory, Good Record, Shining Light, and many other contemporaries are consigned to the scrap pile.

The J. G. C. Hanger.

This hanger is made by the Coleman Hardware Company, Chicago and Morris, Ill. The frame is described as made of Bessemer steel bent from flat bars while hot. The rider bars are malleable iron with ribbed recesses for frames. The claim is made that the hanger is thoroughly braced, so as to be equal to solid

by the various ranges to date: Marquette range, 1,543,447 tons; Gogebic, 1,100,451 tons; Menominee, 926,190 tons; Vermilion, 368,385 tons; total, 3,938,473 tons.

Thompson's Clean Box Shoe Blacking.

The accompanying illustration represents a new style of blacking box which is used by the Thompson Mfg. Company, Lansing-

The J. G. C. Hanger.

forgings. It is put on the market to meet the demand for a hanger that can be sold in competition with cheap goods. It is made in three sizes, No. 0, No. 1 and No. 2, for 20 feet, 12 feet and 7 feet doors respectively.

Combined Drill Holder and Countersink.

Wells Bros. & Co., Greenfield, Mass., have recently put on the market the Little Giant Combined Drill Holder and Countersink represented in the accompanying illustration. It is intended for use with regular twist drills, and the point is made that, the countersink following the drill, the job is completed at one operation. The drill, it will be observed, may be set for the depth of hole wanted. It is so constructed that the countersink cutters can be taken out and ground. The hole

burgh, N. Y. In the cut the box is represented open with the lid resting upon it. In the form in which the box is made, it will be seen that it can be readily held in the hand while the fingers are protected from contact with the brush or blacking by the wide and flaring edge. The manu-

A New Blacking Box.

facturers also call attention to the fact that the box has rounding corners, thus permitting the removal of all blacking by the brush, as there are no sharp corners in

Combined Drill Holder and Countersink.

runs through the holder. This tool is made with $\frac{1}{4}$ -inch or $\frac{1}{2}$ -inch shanks, the $\frac{1}{4}$ -inch being furnished unless otherwise ordered. This tool is made for holding $\frac{1}{8}$, $\frac{5}{16}$, $\frac{3}{8}$, $\frac{7}{8}$, $\frac{1}{2}$ and $\frac{3}{4}$ inch drills. It is described as made of the best tool steel.

A Marquette, Mich., dispatch to the Cleveland Plaindealer, dated October 27, gives the following totals of ore shipments

which the blacking hardens out of reach. The point is also made that from the construction of the lid the box is easily opened without the annoyance that is often experienced from tight covers. The quality of the blacking is also alluded to. The simplicity, neatness, convenience and cleanliness of the box, together with the fact that it costs no more than the common flat box, are other points made in regard to it.

Royal Flint Ware.

George Havell, Newark, N. J., for whom Hibbard, Spencer, Bartlett & Co., Chicago, Ill., are agents, is manufacturer of a line of Royal Flint Ware, including a variety of culinary utensils, some of which are represented in the accompanying illustrations, from which a correct idea may be obtained of the style and special features of the goods. The ware is made of solid crockery, with metal bands for the purpose of attaching the necessary handles. The bottom of each utensil is protected with sheet iron, to which it is attached by means of a bead and groove in the earthen-

Fig. 1.—Oxford Sauce Pan.

ware, into which it is turned. There is an air space between the iron and the bottom of the vessel to prevent burning. Fig. 1 represents the Oxford saucepan, which is made in 1 $\frac{1}{4}$, 2, 2 $\frac{1}{2}$, 3 $\frac{1}{4}$, 4 $\frac{1}{4}$, 5 $\frac{1}{4}$ quarts. Fig. 2, the Venice teapot, which is made in 1, 1 $\frac{1}{2}$, 2, 3, 4 and 6 quarts, and Fig. 3, the Dresden Kettle, which is made in 1, 2, 3 and 5 quarts. The bright metal bands by which the handles are attached contrasting

Fig. 2.—Venice Tea Pot.

pleasantly with the color of the body of the utensils gives them an attractive appearance. The material of which these utensils are made is referred to as a composition possessing absolutely fire-proof qualities, and as only the china comes in contact with the food the desirability of these goods for culinary purposes is alluded to, while they are referred to as commended by their cleanliness, durability

Fig. 3.—Dresden Kettle.

and attractiveness. It is expected that they will fill a place in the kitchen in competition with ordinary agate and granite ware for many purposes. Besides the articles illustrated Mr. Havell's circulars represent the Venice coffee pots, 1, 1 $\frac{1}{4}$, 2, 3, 4 and 6 quarts; Royal pie plates, two sizes; Dresden saucepans, 1, 3 and 5 quarts; Royal pudding pans, 2, 3, 4 and 6 quarts; water coolers, 2, 3 and 6 gallons; Oxford preserving kettles, 1 $\frac{1}{4}$, 2, 2 $\frac{1}{4}$, 3 $\frac{1}{4}$, 4 $\frac{1}{4}$ and 5 $\frac{1}{4}$ quarts; White House pails, 1, 2, 3 and 4 quarts, and White House jars or kettles, 1, 2, 3 and 4 quarts.

Clipper Lamp and Reflector.

The Clipper Mfg. Company, of Cincinnati, Ohio, are offering the trade the Clipper safety lamp, provided with their new style corrugated reflector, a general view

The Clipper Lamp.—Fig. 1.—Lamp Showing One Style of Corrugated Reflector.

of which is afforded by the engraving Fig. 1. This lamp is specially designed for using coal oil as an illuminant and for employment in the kitchen, shop, store or factory. It is claimed to be perfectly safe and to give double the light of an ordinary household lamp. It is constructed of very heavy tin plate, which removes all danger of breakage. The special feature to which the company direct attention is the reflector, which is corrugated in such a manner as to greatly add to the power of the light. It is also arranged in such a way as to serve as a guard to the chimney, keeping it perfectly fast in place, while the handle acts as a bracket, by

Fig. 2.—The Clipper Queen Anne Lamp.

which the lamp may be suspended upon the wall or carried from place to place. The lamp is easily filled, cannot be broken and will not easily upset. Each lamp is thoroughly tested and is guaranteed not to leak if properly filled. Another form of lamp and reflector is shown in Fig. 2 of the accompanying illustrations. In this case the base or foot of the lamp is made of glass, rendering it free from leakage. The reflector is more nearly circular than the one above referred to and is placed in a slightly different position with regard to the lamp chimney. In the back of the handle is a match box, which will be found a great

convenience. These goods are offered the trade in fancy colors, and are packed one dozen in a case.

Compressed Paper Wash-Basin.

Hibbard, Spencer, Bartlett & Co., of Chicago, agents for Snelling & Matches, Newark, N. J., manufacturers, are putting on the market a line of unique wash-basins composed of paper, which has been compressed in the shape shown in the ac-

Compressed Paper Wash Basins.

companied illustration. These basins are warranted thoroughly water-proof, will not crack or foul, and are handsomely decorated in six colors. The manufacturers announce that, while they guarantee them to be adapted to any climate, they will be found specially suitable for use in extremely hot countries where tin and other ware soon become useless. These basins are lighter than those made of tin or crockery and are besides more durable, being non-dentable, and non-breakable. Five sizes are made, the smallest being 11½ inches in diameter by 3 inches in height, and the largest 15½ inches in diameter by 4 inches in height.

Steel Socket Bridge Wrench.

The illustration given below represents a new ratchet wrench designed for turning large nuts. It is manufactured by the Lowell Wrench Company, Lowell, Mass. The tool is so constructed that when once placed on the nut it is not necessary to take it off until the nut has been screwed up as far as desired, the turning being accomplished by the simple oscillation of the handle, as in the well-known ratchet drill. By moving the thumb-latch shown on top the same motion of the lever causes the wrench to turn the nut off instead of on. The point is made in regard to this wrench that it is especially compact and durable, and that the space occupied about the nut is comparatively small, allowing the use of the wrench in close places. The wrenches are made in three sizes, including sockets to take nuts from 1½ inches to 4½ inches in diameter, varying by eighths up to 2

Steel Socket Bridge Wrench.

inches, and then by ¼ inches. The tests to which this wrench has been subjected in practice have convinced the manufacturers that it will be found to meet a want for a tool of this character. The wrenches and sockets are made from steel castings,

and are fully warranted. They are sold in this city by Manning, Maxwell & Moore, 111 Liberty street, New York.

The Ives Counter.

The accompanying illustration represents the Ives Counter, which is put on the market by George E. Ives, New Haven, Conn. It is intended to be attached to a press or other machine for registering its movements so as to give an accurate ac-

The Ives Counter.

count of its productions and showing each operator's progress as often as may be desired. The diameter of the face is 3½ inches, the entire width across face and projections being 4½ inches. The thickness of the entire machine is 1½ inch and the weight 12 ounces. The lever moves ½ inch at the extreme end. The case is of brass, the works being iron and steel, except the faces of the dials which are card-

board secured to brass. The machine may be instantly set at zero or any number desired, by means of a thumb-screw on face. In using the counter it is secured on some stationary part of the machine or near the machine, a wire or chain being attached to the lever, and the opposite end of the wire to the moving part of the machinery when it is ready for use. A single machine is sold at \$4, lots of six at \$3.50, and lots of one hundred or more at \$2.25.

The last quarterly report of the Bureau of Statistics just issued contains, in a tabular form, the rates of import duties

under the several tariff acts from 1789 to 1883, both inclusive, in four groups, from July 4, 1789, to February 5, 1816, from April 27, 1816, to August 30, 1842, from July 30, 1846, to June 21, 1874, and from June 22, 1874, to January 1, 1884.

The Eureka Drum.

We illustrate in the accompanying cuts a combined oven and heating drum, which is the invention of De Witt Van Evra, is manufactured and sold by Kieckhefer, Bartling & Co., 149 Lake street, Chicago. Fig. 1 shows the general appearance of the device with the end door closed. The drum is made with a sheet-iron body and cast-iron heads, oven bottoms, collars and doors. The sheet-iron body can be made of any length, so as to fit a long box stove

The Eureka Drum.—Fig. 1.—General View of Drum with Door Closed.

or an ordinary heating stove as may be found desirable or necessary. It can be used on the top of a stove to secure additional heat or to convert a heating stove into a cooking stove, or it can be placed in an upper room to heat it by utilizing the waste heat from a cooking or heating stove in the room below. The smoke and

is provided on the inside of the drum, forming a convenient arrangement for heating water, irons, &c. The advantages of the Eureka drum, as stated by the inventor, are as follows: A heating stove can be converted into a parlor cook; a

is a spring which is of sufficient tension to hold the prongs closed. By compressing the spring by means of the small handle shown in the cut at the left of the larger one the prongs are opened, releasing the article held between them. By allow-

The Howard Spherical Grate.

cheap high shelf and warming oven are secured, and a great convenience is provided for heating water, irons, &c., with a surface burner.

Champion Window Dresser.

The attention which is being given to the appearance of show-windows at the present day is well known to all in the retail trade who have carefully read the columns of *The Iron Age* during the past year or two. It is also a well-recognized fact that, in order to maintain an attractive display in the show-window, it

ing the handles to spring apart the prongs are again closed. The device is claimed to be cheap, durable, and not likely to get out of order. The stiffness of the spring may be regulated by means of a nut inside the handle. The dresser is 3 feet 8 inches in length, nickel-plated and provided with an ebonized handle.

Howard Spherical Grate.

In the engraving presented herewith is shown a general view of what is known as the Howard Patent Spherical Self-Dump-

Champion Window Dresser.

other products of combustion pass completely around the interior of this drum, being guided by deflecting plates which retain the heat but do not obstruct the draft. Fig. 2 of the illustrations shows the jacket of the drum partly cut away to expose the construction of the interior.

Fig. 2.—View of Drum with Side Partially Broken Away.

The doors are portable; when closed they convert the drum into an oven, but when it is not used as an oven they are intended to be taken off. They are also hung in such a manner as to form shelves when they are dropped down. By reference to Fig. 2 it will be seen that a cooking hole

is necessary to make frequent change in whole or in part of the goods which compose the exhibit. To do this with the greatest convenience is an object sought by all, and devices have been brought out for the purpose of assisting in this direction. Where the windows are high, the upper part of the display contained therein is usually composed of light articles which are placed in position by the assistance of a stepladder. This is, inconvenient and annoying, and in order to obviate the use of such means and provide for a well-defined want in the retail trade, the Anderson & Krum Stationery Company, of this city, have brought out what is known as the George F. Hall Champion Window Dresser, a view of which is presented herewith. It is designed for use in moving light goods from one place to another on a shelf, line or bracket beyond the reach of a person's arm. It is convenient to handle and especially well fitted for dressing and arranging articles in a show-window. By means of the device shown it is claimed that the user can from his position on the floor reach any point in a window, and can handle all articles therein with as much facility as if they were in reach of his arm. The device, as will be seen from the engraving, consists of a pair of prongs, which may be of various forms, operated by means of a rod extending down the hollow shaft to the handle. In the handle

ing Anti-Clinker Grate, manufactured by the Howard Furnace Company, of Syracuse, N. Y. This grate is the invention of Mr. C. D. Howard, and represents the results of years of careful investigation and careful experiment. It is simple in construction, has no cog wheels or other complicated parts to warp or get out of order, and is arranged that it may be operated by a crank or upright lever as may be desired. As will be seen from an inspection of the engraving, the grate is spherical in form, thus presenting a large surface to the fire and therefore more air for combustion. The arrangement of parts is such that the grate cannot be left so as to burn out. Every time it is moved or partially revolved a new surface is presented, at the same time shaking and cleaning the fire perfectly. The parts are all strongly built and the grate is claimed to embody all the good points of other grates at present in use.

The Philadelphia *Record* made an attack on the Bethlehem Iron Company, in which the assertion was made that the company paid \$1,860,000 in dividends in seven years and put \$1,200,000 of earnings into new plant. Joseph Wharton, in a letter to the *Press*, corrects the figures, making the dividends \$1,740,000, and showing that the funds for new plant were raised by a mortgage.

CURRENT HARDWARE PRICES.

OCTOBER 31, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

CURRENT METAL PRICES.

OCTOBER 31, 1888.

The following quotations are for small lots. Wholesale prices, at which large lots only can be bought, are given elsewhere in our weekly market reports.

IRON AND STEEL.

Bar Iron from Store.

Common Iron:	
3/4 to 2 in. round and square...	1.90 @ 2.00¢
1 to 6 in. x 3/4 to 1 in.	
Refined Iron:	
3/4 to 2 in. round and square...	2.10 @ 2.2¢
1 to 4 in. x 3/4 to 1 1/2 in.	
4 1/2 to 6 in. x 3/4 to 1 in.	2.30 @ 2.4¢
1 to 6 in. x 1/4 and 5-16	2.20 @ 2.3¢
Rods—3/4 and 1-1/2 round and sq.	2.30 @ 2.4¢
Bands—1 to 6 x 3-16 to No. 12	3.00 @ ...
"Burden Best" Iron, base price...	2.80 @ ...
Burden's "H. B. & S." Iron, base price...	2.80 @ ...
"Ulster"	3.10 @ ...
Norway Rods	4.00 @ 5.00¢

Merchant Steel from Store.

Open-Hearth and Bessemer Machinery,	Per pound.
Toe Calk, Tire and Sleigh Shoe, base price in small lots	2 3/4¢ @ 3¢
Best Cast Steel, base price in small lots	5 1/4¢ @ 9 1/4¢
Best Cast Steel Machinery, base price in small lots	5 1/4¢ @ 6¢
For Classification and Extras adopted by the Merchant Steel Association of the United States, June 1, 1888, see <i>The Iron Age</i> , June 21, 1888.	

Sheet Iron from Store.

Common American.	R. G. Cleaned.
10 to 16	2.75 @ 2.80¢
17 to 20	2.85 @ 3.00¢
21 to 24	3.00 @ 3.10¢
25 and 26	3.20 @ 3.50¢
27 and 28	3.35 @ 3.75¢
28	3.50 @ 4.00¢
B. B.	2d qual.

THE IRON AGE

THURSDAY, NOVEMBER 8, 1888.

New Power Presses.

Among new presses recently put on the market by the E. W. Bliss Company, of Brooklyn, N. Y., are the two which we illustrate on this and the next page.

Fig. 1 represents a press, required for drawing up dish-pans, milk-pans, sauce-

think, by reference to the engraving. By means of a special device, the plunger may be lengthened or shortened very quickly, while the outer slide or mandrel is provided with means of adjustment, as shown by engraving.

The press is driven by pulleys, 24 inches by 6 inches on the back shaft, on which is

a very powerful machine, in compact form, occupying, as it does, a comparatively small floor space. A feature of interest to users is the adjustable table, to which the die, or lower knife for shearing, is secured. It has an adjustment of 9 inches in height, allowing a clear space between table and slide, varying from 4 to 13 inches, thus

Fig. 1.

SHEET-METAL DRAWING PRESS, BUILT BY THE E. W. BLISS CO., BROOKLYN, N. Y.

pans, trays, some articles of brass and copper, deep ironware, &c., &c. The main feature of this machine is the novel arrangement of links in connection with rock-shafts and slide, by means of which the blank holder or outer slide is pressed down, and remains stationary during a sufficient part of a revolution of crank to permit the plunger to descend and draw the blank into shape before releasing its hold and rising. A crank pin in the disk on the outer end of the shaft carries the slide attached to it up and down at every revolution of crank, thus operating the links and rock shafts above mentioned. This action will be clearly understood, we

mounted a fly-wheel 45 inches in diameter, and weighing 900 pounds, to give steadiness of motion. The large gear is 60 inches in diameter, and the proportion through the intermediate gearing, between it and the pinion on first shaft, is 28 to 1. All other parts of the machine are correspondingly strong, making it a very powerful press, suitable for making deep stamped ware requiring a blank not exceeding 26 inches in diameter; the finished work not exceeding 20 inches in diameter, nor 6 inches in depth. The weight, complete, is 21,000 pounds.

Fig. 2 illustrates a punching and shearing press. The design is such as to make

adapting it for a large variety of work not usually accommodated in a press of this kind. Any size opening may be cored in the table, not exceeding 6 x 10 inches, or 6 inches round. Two large holding bolts, one on each side of the table near the top, secure it firmly in position against the front of the press frame, while a projecting arm, or lug, cast on the under side of the table, rests on a large adjusting screw, as shown in the cut, giving ample support for the heaviest kind of cutting. For much of the work which this machine is adapted no gearing is required; a fly-wheel, 54 inches in diameter, weighing 1300 pounds, mounted on a shaft

where the gear is shown, giving ample power. But for very heavy cutting or punching, a 5-foot spur-gear is used, with pinion, making the proportion of gearing $7\frac{1}{2}$ to 1. This is driven by tight and loose pulleys, 24 x 5 inches, with a 36-inch fly-wheel, weighing 700 pounds, to give steadiness of motion. The slide has a 2-inch stroke, working in adjustable bearings. The machine throughout is built of the best material and workmanship, making it a desirable tool for manufacturers of iron and steel goods, iron railings, architectural ironwork, agricultural implements, &c., &c.

Deep Stampings.—The great superiority of stampings over built-up articles in metal is too well known to need to be

water tight without solder. The top of the can is closed with Griffin's lever opening lid, which also makes an air-tight joint by mere contact. It is proposed to make cans of large size by this process and to line them with enamel for the storage of many articles of food.

Preserving Exposed Ironwork.

A recent issue of *Industry*, of San Francisco, Cal., contains the following under the above head:

John Heald, the proprietor of the machine works at Crockett, Contra Costa County, has for some years past been experimenting with a view to preserving exposed ironwork, and has demonstrated some things respecting this important

pentine and white lead mixed thin, the very pores of the iron are closed. The interstices, to so call them, are too minute to receive the body which oil gives, but are closed by the thinner compound. This is the theory, but that is a matter of no consequence so long as the fact is known.

We recommend experiments with this method of protecting iron, an account of which we publish at Mr. Heald's suggestion, and any further information will no doubt be furnished if application is made to him. The preservation of surfaces beneath the light coat of a shipping mark is something which most every one has observed but never thought of as differing from the effect of common paint mixed with oil. The process will be an impor-

Fig. 2.

PUNCHING AND SHEARING PRESS, BUILT BY THE E. W. BLISS CO., BROOKLYN, N. Y.

insisted upon. In cans for containing preserved provisions there is the additional advantage that when stamped there is no need to use solder in the internal joints, and hence the chance of lead poisoning is entirely removed. But deep stampings are very expensive to make, and a limit is soon reached beyond which the metal cannot be got to flow. To meet this difficulty Mr. Featherstone Griffin, of the Self-Opening Tin Box Company, has, according to *Engineering*, devised a method of building up stampings without solder. The bottom of a can or cask is stamped with a part of the cylindrical wall in the usual way; the remainder of the can is formed of similar stampings with the bottom cut off, leaving them short cylinders. The end of one cylinder is placed within the end of the next, and the joint is then passed between rolls, which corrugate it and make the union perfectly air and

matter that may be of great value. Mr. Heald some years ago had occasion to move a gas holder at Vallejo, and happened to notice on the old plates, which were badly corroded, that the "shipping marks" on the sheets were perfectly preserved. This led to the examination of other cases of the kind where marking had been done on ironwork, and also to experimenting with turpentine and white lead as a first coating to prevent rust. It is found that when surfaces are coated with finely ground lead thinned with spirits of turpentine, no corrosive action or scaling takes place, even when heavy coats of paint are afterward put on the outside. Mr. Heald says that common paint mixed with oil is too thick to penetrate or close the imperfections of the surface and penetrate beneath the scale where it exists, thus leaving places for corrosion to begin beneath the paint. With tur-

tant one for iron vessels, above water at least. The wash can be quickly put on, and will dry in a short time.

The city's rights in relation to wharf property having been more distinctly defined by the Court of Appeals, in the case of Wm. H. Kingsland, Mayor Hewitt recommends that measures be taken for completing the Dock Department's plan for the general improvement of the water front and the increase of wharfage facilities on both rivers.

Denver, Col., will soon have one of the finest Masonic temples in the West, costing not far from \$250,000. It will be seven stories high with a frontage of 125 feet and a depth of 100 feet. Every girder and beam throughout the building will be of iron, not even a wooden step or staircase being used.

Improvement of the Steam Engine.

In a paper entitled "The Distribution of Internal Friction of Engines," presented at the recent meeting of the American Society of Mechanical Engineers, Prof. Robert H. Thurston gave at length the results of a series of interesting tests made at different times with the view of correctly apportioning this friction. To the means employed for this purpose we have already briefly referred in our first report of the meeting. The plan, it will be remembered, consisted in first determining the whole friction of each engine tested, and then dismantling the engines, part by part, driving the connected parts by a pulley and belt from a line of shafting through a carefully standardized transmitting dynamometer.

Without going into all the details of the paper, it is of interest to note the conclusions at which Professor Thurston arrives. The improvement of the steam engine, he says, has to-day reached a point beyond which, in its thermodynamic relations, but little advance can be anticipated. Under usual conditions of operation of our very best engines, they are so near the efficiency of the ideal engine, working under precisely similar conditions, that the range of possible gain left to us is too small to permit us to look in that direction for rapid or important changes in further increase of efficiency and economy. Where the ideal engine would consume 10 pounds of steam per horse-power per hour, we have actually reached as little as 14, if the latest and best reports of the best of modern engines may be accepted as substantially correct; and even this 80 per cent. margin is reduced by practical conditions restricting expansion. If it were to be asserted that we may hope to bring the consumption of steam in good engines of the best type down to as low as 12 pounds per hour per horse-power, it is probable that the most experienced and best informed engineers would think it a somewhat rash statement; but that is what the tendency and rate of recent improvements would seem to promise for the immediate future, assuming that no very great increase in pressures and temperatures of steam may be expected. Practically, also, it is now known that the highest duty is not the most desirable, nor, on the whole, the most advantageous, condition of operation of the engine, and we are restricted to lower duties and reduced efficiencies whenever we consider financial relations. It is, nevertheless, the fact that the conditions of improvement are those which also give higher ratios of expansion. The duty to seek further means of improvement and higher efficiency becomes all the more imperative when we study the practical conditions under which our engines must be employed. Having, however, as just remarked, so nearly reached the limit of possible gain on the thermodynamic side, it becomes advisable to seek the more carefully for opportunities of improvement in other directions. We have, in the work outlined in this paper, both the directions shown us and the specific method of procedure suggested.

The real, final efficiency of the steam engine, or of any heat engine, is composed of the resultant of several distinct efficiencies, as the thermodynamic efficiency, the efficiency of the engine as a heat preserver and user, the efficiency as a machine, and the efficiency of a whole considered from a commercial standpoint. Of these several efficiencies we have the means of studying the efficiency of the machine as a division of the whole within which to seek the best means of securing a gain of total efficiency. The real and final efficiency is certain to be increased if we can effect an

improvement at this point, whatever the extraneous conditions of operation. Finding little chance of gain thermodynamically, it becomes our duty to ascertain what are the probabilities of securing progress elsewhere. It is at once seen that the difference here between the real and the ideal engine is greater than in the domain of thermodynamics, the best cases being in both instances taken. Those engines which are most nearly perfect thermodynamically are undoubtedly often least perfect, or at least of the least perfect types, when the efficiency of the engine as a machine is studied. Few of them have less than a total of 20 per cent. friction, while they are sometimes probably nearer the ultimate limit of improvement, practically, as converters of heat into work. We are now, for the first time in the history of the theory of the steam engine, in a position to say just where the losses of the machine are in detail, how we are to endeavor to reduce them, in what degree we may hope for such gain, and where it is to be found if effected at all.

The first and most remarkable fact to be noted is the extraordinary amount, absolutely and relatively, of the friction of the crank shaft. This amounts to nearly one-half of the whole waste, and to from 5 to 10 per cent. of the whole power of the engine, in the cases here examined. It is remarkable not only for its amount, but also because of the fact that we had begun to believe that, under similar conditions of pressure, speed of rubbing, and of lubrication, it was perfectly practicable to bring down the coefficient to less than 1 per cent. and perhaps to as little as one-tenth of 1 per cent. However, we find that this coefficient rises, in the unloaded engine, to about 0.30 as a maximum, and, as a minimum, to at least 0.09; while it only falls 0.04 in the best case, with the increase of pressure on the bearings due to full load and power. This is the more astonishing when it is considered that, on the axle of the car-wheel, it has been found often that the friction is a fraction of 1 per cent. and often as low as one-tenth per cent. Here is evidently the first place in which to seek further improvement. If this item can be brought down as low as in car-axle journals, the efficiency of the engine as a machine will be increased by about 5 per cent. in the very best cases, and by 10 per cent. in ordinary engines. How this is to be done can be best ascertained when it is found just what are the causes of this extraordinary and previously unsuspected loss. The only conditions apparent tending to aggregate this waste are the continuous rotation in one direction and the unintermitted pressure of the journal in its bearing. It would appear probable that it is a case of commonly imperfect lubrication. Could the oil-bath system in method and in results be secured here, it would seem probable that the friction might be enormously reduced. It would, even in many cases, if not in all, pay well to have a thoroughly reliable system of lubrication by means of a forcing pump that should insure the support of the journal upon a cushion of lubricant, thus making its action analogous to that of the "*palier glissant*" of Giffard and the "water bearing" of Shaw and of others.

The second and most obvious conclusion is that the valve should be balanced and so connected as to cause the least possible waste by friction through its motion or that of its moving connections. There is evidently no probable line of improvement so certain to yield a large and profitable result as this. The balancing of the valve has been accomplished, and frequently, during many years past, so successfully that there is no excuse for neglecting this point in even the cheapest classes of engines. No engine can be considered as belonging to the best class which is not either pro-

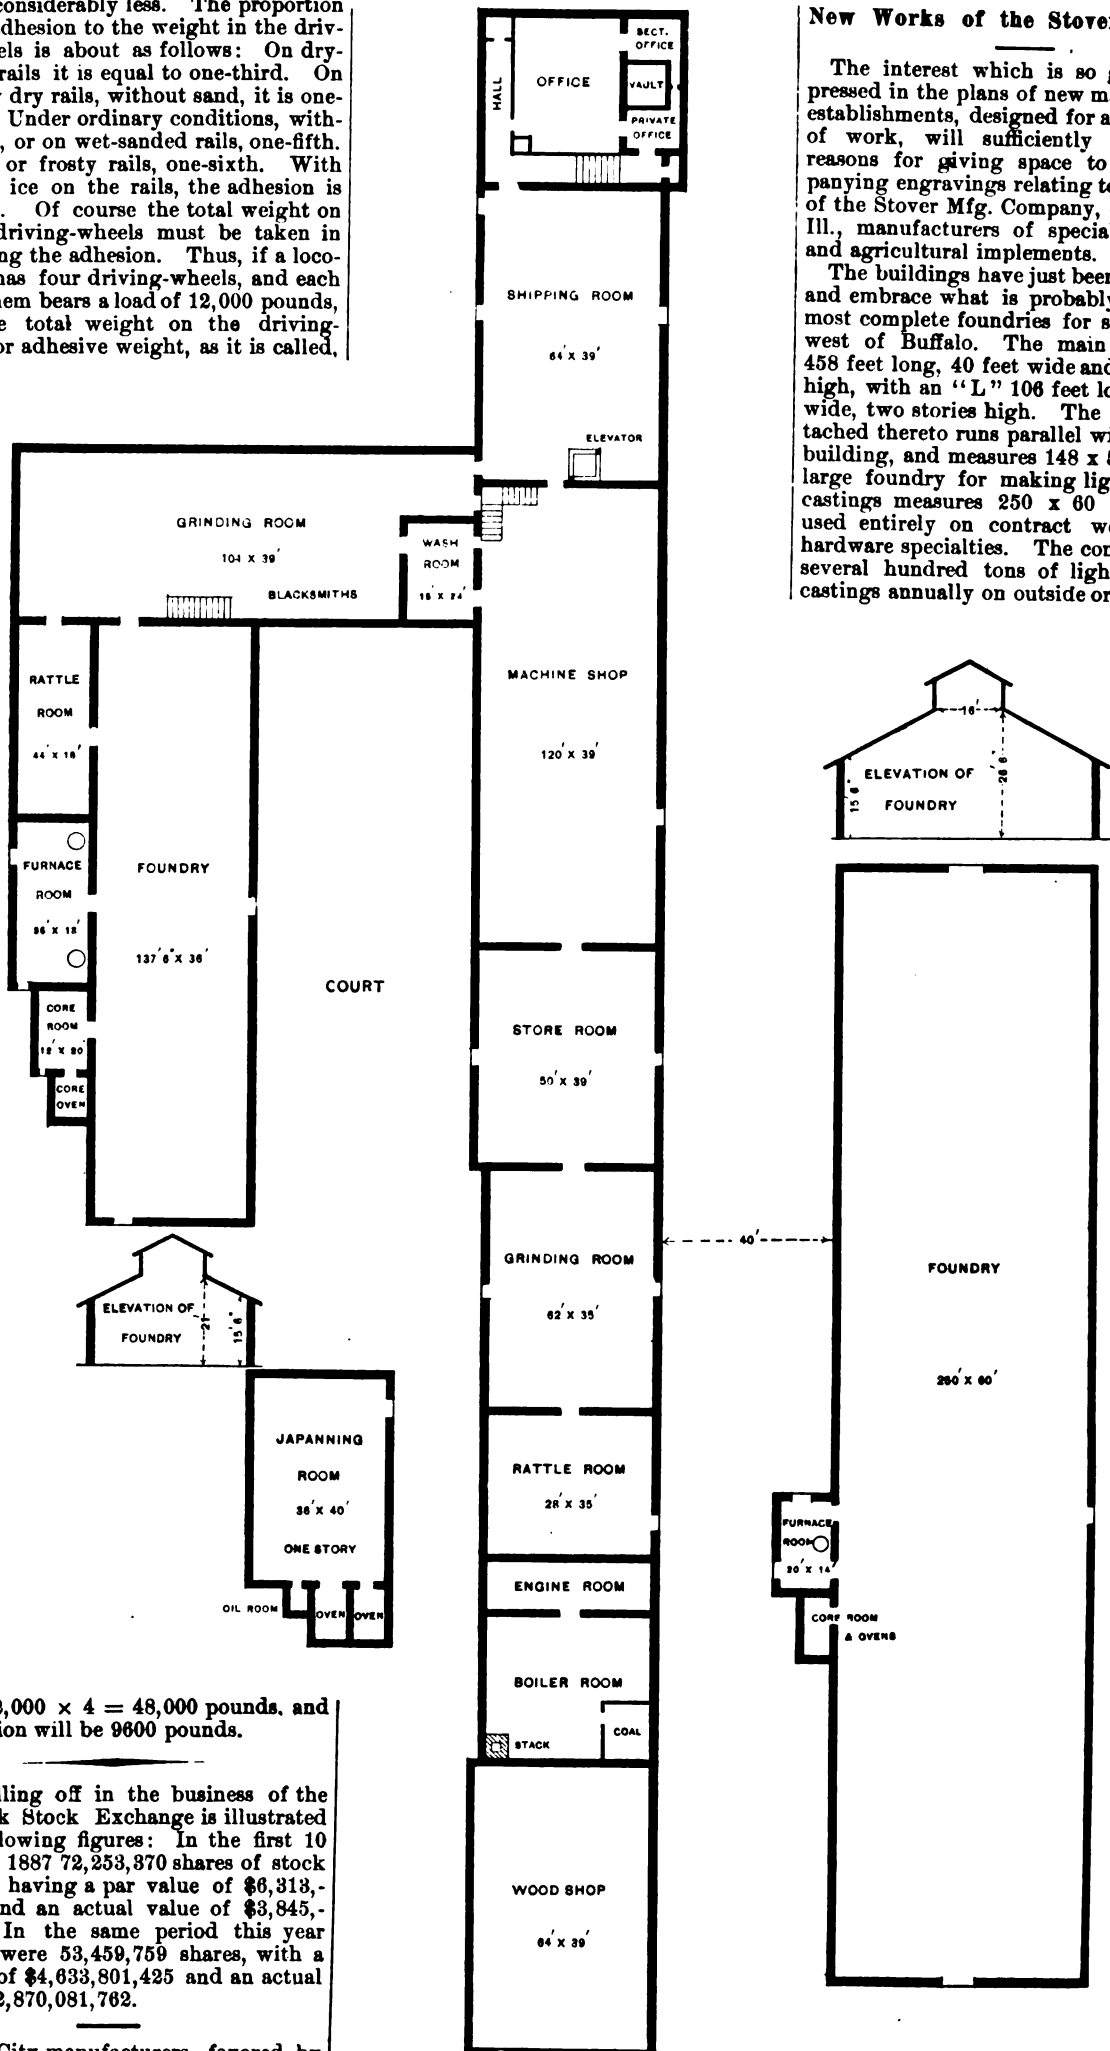

vided with a balanced valve or which has not a system of valve gear, as with some of the "drop cut-off" engines, in which the loss in this direction is rendered insignificant. Here lies an opportunity to raise the efficiency of mechanism of ordinary engines at least 5 per cent., and of the best of engines with unbalanced valves 2 or 3 per cent. It is evidently better, in many cases, to have a valve which is balanced, though slightly leaky at times, than to use an unbalanced valve, though absolutely tight at all times. The simple fact, here revealed, that nine-tenths of this friction may be avoided is very important.

The third item in order of importance is the friction of piston and its rod. This is as great as that just referred to, and is vastly more variable with the class of engine, and probably in the same engine with differences in handling, and especially in setting up packing and springs, where they exist. The writer has often known the power of an engine to be sensibly affected by the carelessness or inexperience of the attendant, who had screwed up his packing in the rod stuffing-box too tightly, and has, on more than one occasion, had a similar experience where the rings were set out too hard. The metallic packings and the unpacked pistons and rods now coming slowly into use will unquestionably do much to remedy this defect of the average engine. Meantime, with the older design, it is perfectly possible to keep piston and stuffing-box tight without wasting much power or by slowing down the engine by conversion of heat into work at points where the operation is likely to produce serious harm as well as waste. Rings are much oftener too tight than too loose, and a stuffing-box should only be set up when the engine is running, and then only with fresh packing and not more than is sufficient to check any visible leakage. New packing in a well-made box never needs much compression, and when it becomes necessary to screw it down hard it is time to replace it by new. Any packing that compels severe compression when new should be promptly condemned.

The remaining items are of minor importance as bearing upon the efficiency of the machine, and they are all obviously easily taken care of by a good designer and a good engineer in charge. Here, if anywhere, it is the fact that freedom of lubrication is the essential consideration, and the more nearly most absolutely flooded the parts can be, and the more absolutely certain lubrication can be made, the better, and irrespective, also, to a great extent, of the cost of the lubricant. Any lubricant freely used can be filtered and cleansed in such manner and so effectively that its more or less free supply to the bearing is a matter of no consequence as a matter of first cost; while the cost of wasted power and fuel, and of repairs due to excessive friction and wear, will usually enormously exceed any apparent gain in that direction.

Slipping of Locomotive Drivers.—Mr. M. U. Forney, in the *Railroad and Engineering Journal*, says that the force required to make locomotive driving-wheels slip will vary very much with the condition of the rails. If they are quite dry and clean it will require a force equal to about one-fourth the weight on the wheels. That is, supposing we have a wheel attached to a frame which is fastened so that it cannot move, and that the wheel rests on a rail and is loaded with, say, 12,000 pounds, if a rope or chain could be attached exactly at the tread of the wheel, and carried over a pulley, then it would require a weight of about 3000 pounds attached to the end of the rope to make the wheel slip. If the rails were sanded, the adhesion would be somewhat greater, and if they were wet or muddy or

greasy, considerably less. The proportion of the adhesion to the weight in the driving-wheels is about as follows: On dry-sanded rails it is equal to one-third. On perfectly dry rails, without sand, it is one-fourth. Under ordinary conditions, without sand, or on wet-sanded rails, one-fifth. On wet or frosty rails, one-sixth. With snow or ice on the rails, the adhesion is still less. Of course the total weight on all the driving-wheels must be taken in calculating the adhesion. Thus, if a locomotive has four driving-wheels, and each one of them bears a load of 12,000 pounds, then the total weight on the driving-wheels, or adhesive weight, as it is called,

New Works of the Stover Mfg Co.

The interest which is so generally expressed in the plans of new manufacturing establishments, designed for a special class of work, will sufficiently explain our reasons for giving space to the accompanying engravings relating to the works of the Stover Mfg. Company, of Freeport, Ill., manufacturers of special machinery and agricultural implements.

The buildings have just been completed, and embrace what is probably one of the most complete foundries for small articles west of Buffalo. The main building is 458 feet long, 40 feet wide and two stories high, with an "L" 106 feet long, 40 feet wide, two stories high. The foundry attached thereto runs parallel with the main building, and measures 148 x 58 feet. The large foundry for making light gray iron castings measures 250 x 60 feet, and is used entirely on contract work, mostly hardware specialties. The company make several hundred tons of light gray iron castings annually on outside orders besides

will be $12,000 \times 4 = 48,000$ pounds, and the adhesion will be 9600 pounds.

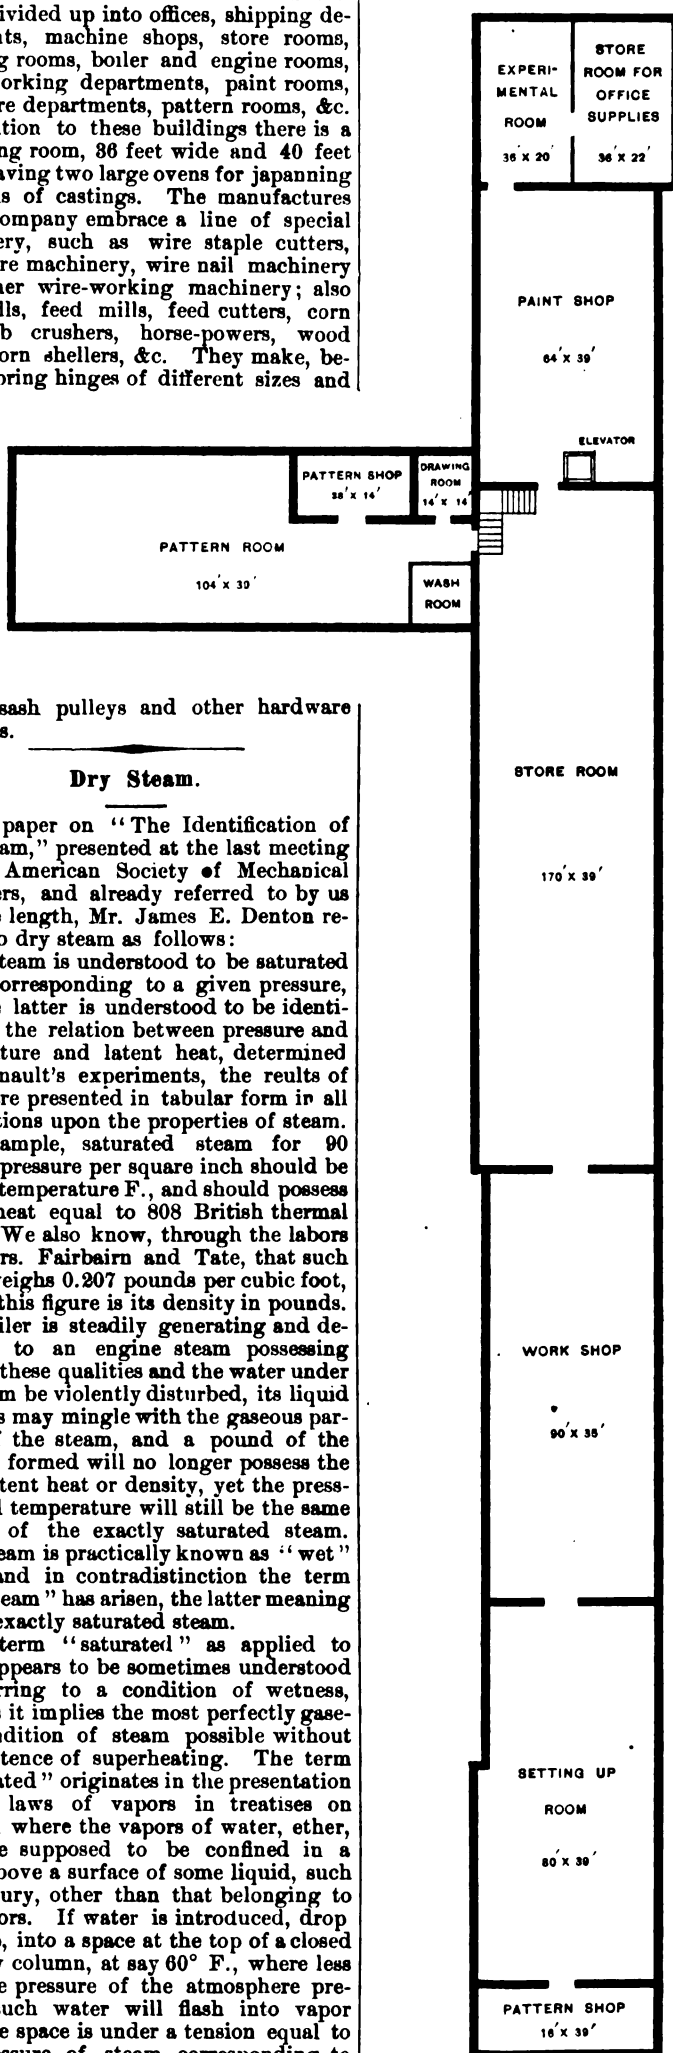

The falling off in the business of the New York Stock Exchange is illustrated by the following figures: In the first 10 months of 1887 72,253,370 shares of stock were sold, having a par value of \$6,313,396,325 and an actual value of \$3,845,025,768. In the same period this year the sales were 53,459,759 shares, with a par value of \$4,633,801,425 and an actual value of \$2,870,081,762.

Kansas City manufacturers, favored by shorter railroad connections, have formed a syndicate to engage in direct trade with Mexico

Fig. 1.—General Ground Plan.

NEW WORKS OF THE STOVER MFG. COMPANY, FREEPORT, ILL.

doing their own work. The main building is divided up into offices, shipping departments, machine shops, store rooms, finishing rooms, boiler and engine rooms, wood-working departments, paint rooms, hardware departments, pattern rooms, &c. In addition to these buildings there is a japanning room, 86 feet wide and 40 feet long, having two large ovens for japanning all kinds of castings. The manufactures of the company embrace a line of special machinery, such as wire staple cutters, barb wire machinery, wire nail machinery and other wire-working machinery; also windmills, feed mills, feed cutters, corn and cob crushers, horse-powers, wood saws, corn shellers, &c. They make, besides, spring hinges of different sizes and

styles, sash pulleys and other hardware novelties.

Dry Steam.

In a paper on "The Identification of Dry Steam," presented at the last meeting of the American Society of Mechanical Engineers, and already referred to by us at some length, Mr. James E. Denton referred to dry steam as follows:

Dry steam is understood to be saturated steam corresponding to a given pressure, and the latter is understood to be identified by the relation between pressure and temperature and latent heat, determined by Regnault's experiments, the results of which are presented in tabular form in all publications upon the properties of steam. For example, saturated steam for 90 pounds pressure per square inch should be at 320° temperature F., and should possess latent heat equal to 808 British thermal units. We also know, through the labors of Messrs. Fairbairn and Tate, that such steam weighs 0.207 pounds per cubic foot, or that this figure is its density in pounds. If a boiler is steadily generating and delivering to an engine steam possessing exactly these qualities and the water under the steam be violently disturbed, its liquid particles may mingle with the gaseous particles of the steam, and a pound of the mixture formed will no longer possess the same latent heat or density, yet the pressure and temperature will still be the same as that of the exactly saturated steam. Such steam is practically known as "wet" steam, and in contradistinction the term "dry steam" has arisen, the latter meaning simply exactly saturated steam.

The term "saturated" as applied to steam appears to be sometimes understood as referring to a condition of wetness, whereas it implies the most perfectly gaseous condition of steam possible without the existence of superheating. The term "saturated" originates in the presentation of the laws of vapors in treatises on physics, where the vapors of water, ether, &c., are supposed to be confined in a space above a surface of some liquid, such as mercury, other than that belonging to the vapors. If water is introduced, drop by drop, into a space at the top of a closed mercury column, at say 60° F., where less than the pressure of the atmosphere prevails, such water will flash into vapor until the space is under a tension equal to the pressure of steam corresponding to 60° temperature. Then if more water be introduced into the space, it refuses to

vaporize, but accumulates as liquid water on the surface of the mercury, and consequently the space, and hence the vapor in that space, is said to be "saturated." Before the space or vapor is thus saturated the vapor of water present is "non-saturated" steam, and, if compressed, its pressure increases without causing any liquefaction, the vapor following the laws of fixed gases, like air, &c. When the space or vapor becomes saturated any compression of the vapor does not result in increased pressure (the temperature being assumed constant), but instead some vapor liquefies. Similarly the steam in a practical boiler (where there is always liquid water beneath the steam) is saturated, because any effort to make a given weight of steam occupy less space, either by raising the water level or by other compression of the steam, causes a portion of this weight of steam to liquefy without changing the vapor tension, assuming the temperature of the contents of the boiler to remain constant. The only practical at all condition corresponding to "non-saturation" as described in physics is when steam is superheated. If a sufficient portion of the heating surface of the boiler above the water line be exposed to the action of the fire, the pressure of the steam may remain the same, and yet its temperature may be greater, the latent heat greater, and the density less than corresponds to saturated steam. Such steam is practically known as superheated steam.

In measuring the performance of a boiler the essential determination is the quantity of heat utilized by the generation of steam. If the steam generated at say 90 pounds pressure is dry steam, then for each pound of feed water the boiler is to be credited with utilizing 120 heat units, due to the temperature of the steam if the feed water is at 200° F., and 808 heat units due to its latent heat, or a total of 928 heat units. If, however, 10 per cent. of the steam is liquid water mechanically mixed with 90 per cent. of dry steam, then for each pound of feed water the boiler is to be credited with 1.10×120 heat units, due to temperature, and 0.90×808 heat units, due to latent heat, or a total of 859 heat units, which is 92 per cent. of the dry steam total. Unless, therefore, allowance for the presence of moisture is made, the efficiency of a boiler is made too great for ordinary steam pressures, at the rate of $\frac{1}{5}$ per cent. for each 1 per cent. of water in the steam. Again, if steam at 90 pounds pressure is superheated 10° F., so that its temperature is 330° F., then for each pound of feed water at 200° F. we must credit the boiler with the heat due to dry steam plus $0.48 \times 10^\circ = 4.8$ heat units, so that failure to allow for superheating makes the efficiency of a boiler, at ordinary pressures, too low by about 0.05 per cent. for each degree F. of superheating.

It is customary among experts to make these allowance in reporting the performances of boilers, and hence arises the necessity of determining to what extent the steam generated by a given boiler differs from exactly dry steam. If the steam is superheated, the simple observance of its temperature by a proper thermometer affords the desired data. If, however, the steam is shown by a thermometer to be at exactly the temperature due to saturation, it may contain any amount of water in suspension, and the determination of the amount of the latter can in general only be accurately known by a measurement of either the latent heat or density of a known weight of the mixture. The determination of the density is an operation too delicate to have been yet attempted with portable apparatus. The determination of latent heat involves simply the condensation or mixture of a known weight of steam in or with a known weight of some other substance of known specific

Fig. 2.—Second-Floor Plan.

heat, and the operations to be performed are such as can be carried out with apparatus of a convenient portable nature.

Recent Legal Decisions.

PARTNERSHIP.

A firm engaged in making agricultural implements organized itself into a corporation to conduct a like business, and the members of the firm each were to get the value of their interest in stock. C.'s portion was \$20,000 of the capital stock, \$17,500 of which he sold or exchanged for a house and lot. Before the change was fully carried out C. died, and on the distribution of the stock \$17,500 were delivered to the grantor of the house and lot and \$2500 to the executors of C. When the corporation was created the members of the firm considered it entirely solvent, but it turned out that it was, at that time, unable to pay its debts, and S., N. & Co., Limited, a creditor of the firm, sued the executors to compel the application to the payment of its demand of the \$2500 of stock, and of the property conveyed for the \$17,500 of the stock. Individual creditors of C. were made parties to this suit—Singer, Nimick & Co., Limited, *vs.* Carpenter—and they contended that the partnership creditors were not entitled to a preference on the stock distributed to C. The trial court decided against the S., N. & Co., and the intermediate court affirmed the judgment, but a further appeal was made to the Supreme Court of Illinois, where the S., N. & Co. were again defeated. Judge Scholfield, in the opinion, said: "The law does not recognize that the creditor of a firm has a superior equity to that of the individual creditor of a member of the firm for payment from the partnership's assets. It recognizes, however, that the members of the partnership have a superior lien on the partnership property for the payment of the firm debts, and allows the creditors to avail themselves of this lien, to the exclusion of individual creditors, where it has not been surrendered to the partners. The other partners here having joined with the deceased partner in the contract to form the corporation, and distribute the stock therein in the proportion of their respective interests are, of course, concluded by it if he was bound. While that contract did not vest a present title, it vested a right in the corporation to have it performed, and, by reason of the peculiar property to be transferred—partly real and partly personal—and the personal property having its peculiar value by reason of its adaptation to use in connection with the use of that realty, an equity vested in the corporation to have that particular property, and a Court of Chancery would therefore have decreed a specific performance of the contract at the instance of the corporation, it not being in default. It would, moreover, seem that as the money the S., N. & Co. are claiming to appropriate is money derived from subsequent sales of the stock of the corporation, that, of itself is sufficient to deny its right to it. The stock was not partnership property, and its proceeds cannot be. If the partnership property did not vest in the corporation pursuant to the contract, it is just as it was before the attempted transfer, and the firm creditors may resort to it; and if the corporation issued stock to the individual for which it had not been paid, and to which the individual was not entitled, the loss is manifestly upon the corporation, and not upon the creditors of the firm of which the individual was a member. But if the partnership property did vest in the corporation, the interest of the partners in it was thereby terminated, and with their interest terminated that of the firm creditors."

In equity it was a conversion of partnership property into individual property as of the date of the contract."

RESTRAINT OF TRADE—CONTRACT TO CONTROL THE MARKET.

A lumber corporation made an agreement with two persons who were manufacturers of lumber in Santa Cruz County, Cal., by which they were to supply them 2,000,000 feet of lumber during the year, at \$11 a thousand, and these persons stipulated that they would not make any lumber to be sold during the year, in the counties of Monterey, San Benito, Santa Cruz and Santa Clara, except under this contract, and as a penalty pay \$20 a thousand for any lumber made and sold in these counties to other persons. The contract was not carried out, and the corporation sued for damages. In this case—Santa Clara Valley Mill and Lumber Company *vs.* Hayes—the court found that the contract sued upon was made for the purpose of limiting the supply of lumber made in these counties, and to increase the price of it in the State under a combination among all the lumber dealers in or near Felton, in Santa Cruz County, to control the lumber market for the year, and that the contract was void, as against public policy, it being in restraint of trade. The defendants had judgment, and plaintiff carried the case to the Supreme Court of California, where the plaintiff was again defeated. The Chief Justice (Searles), in the opinion, said: "When there is fraud or mistake in a contract the parties to it may have relief for the personal injury, but when it is an illegal contract society is injured, because the motive of wrong-doing in it is far-reaching. This illegality may be in the consideration, or in the promises and stipulations of the agreement. Among the contracts illegal under the common law, because opposed to public policy, were contracts in general restraint of trade—contracts between individuals to prevent competition, and keep up the price of articles of utility. In a New York case—*Arnot vs. Coal Company*—it was found that the contract involved therein limited the mining of coal at a certain colliery at Pittston, Pa., for the purpose of controlling the supply of coal for the market at Elmira, N. Y. The defendant was the head of a combination to effect this end, and it refused to pay the Pittston Company for coal delivered to it under the contract, upon the ground that it had sold coal to other parties, in violation of its agreement. *Arnot* became its assignee, and sued for the coal delivered. The New York Court of Appeals, in declaring the contract invalid, said: 'A combination to effect such a purpose as this is inimical to the interest of the public; all contracts designed to effect such an end are contrary to public policy, and therefore illegal, as is well settled by adjudicated cases. Every producer or vendor of coal or other commodity has the right to use all legitimate efforts to obtain the best price for the articles in which he deals, but when he endeavors to artificially enhance prices by suppressing or keeping out of the market the product of the labor of others, and to accomplish that purpose by the means of contracts binding such other persons to withhold their supply, such restraints are even more mischievous than combinations not to sell under an agreed price. Combinations of that character have been held to be against public policy, and illegal.'"

It is a remarkable roll of munificent bequests that John Guy Vassar, of Poughkeepsie, has left. He has bequeathed \$250,000 to a hospital, \$100,000 to an orphan asylum, \$65,000 to an aged men's home and \$145,000 to educational institutions, besides large sums to other objects.

The Lebel Rifle.

In a recent issue we referred briefly to the fact that the extreme curiosity which has been manifested for some time past as to the construction of the Lebel rifle, of which 350,000 are now being issued to the French army, had, in a measure, been satisfied by the publication, through the French Minister of War, of illustrations and a description of the weapon in *Instruction sur l'armement de l'infanterie*. We take pleasure in reproducing the engravings in this issue, being indebted for the particulars to the *London Engineer*.

The weapon is really a modification of the Gras rifle of 1885, which, in its turn, was a modified Kropatchek, in use in the French Navy since 1878. The principal modification is in the caliber, which has been reduced from 0.472 inch to 0.315 inch. The diminished weight of the weapon and its ammunition is a matter of very great importance, while the new powder employed renders, it is claimed, the small bore bullet as efficient as the large bore was with ordinary powder. A further improvement has been effected in the block which takes the force of recoil, which now works on two tenons, instead of as hitherto being supported only on one side.

The magazine is parallel with the barrel. In it the cartridges are placed end to end. A spring with a button on the end forces the cartridges toward the rear into a species of spoon, A, by which the cartridge is raised into such a position that it is readily thrust forward into the chamber by the action of the sliding breech block C P. A detent, G, prevents the next cartridge from finding its way under the spoon. By means of the thumb button L the repeating mechanism can be locked, and the rifle can then be fired as an ordinary breech-loader.

Fig. 1 is an elevation showing the rifle with the breech closed, ready for firing. Fig. 2 is a top view. Fig. 3 shows the rifle in section with the breech block open; an empty cartridge is still in the jaws of the extractor ready to be thrown out at the top. In Fig. 4 the cartridge has been ejected and the spoon contains a cartridge ready to be pushed into the chamber by the act of closing the breech. The locking and percussion mechanism are identical with those of the Gras rifle. The new weapon measures all over, with its sword bayonet, 4 feet 8½ inches, and weighs 9½ pounds with eight cartridges in the magazine.

The proposed Congress of American nations in 1889, for the purpose of adopting a uniform system of weights and measures, a common silver coinage, laws for the regulations of patents, copyrights, trade-marks, &c., and an equitable method of settling all International disputes, is regarded by not a few as claiming an importance that can hardly be overestimated. With impending strikes and certain branches of trade paralyzed by over-production, it is inexplicable that our manufacturers should not have made greater efforts to compete with the English, French and Germans, in Spanish-America, a market which, geographically considered, we should easily control. If time ever becomes an item of value to our easy-going Southern neighbors, our share of this enormous and highly lucrative commerce should speedily rise above the shameful and meager tenth, with which we seem at present contented, and our merchandise should be carried, too, in American ships.

At Columbus, Ohio, November 1, the works of the Columbus Bridge Company were destroyed by fire. Loss is estimated at \$20,000, of which \$15,000 is on machinery.

THE NEW RIFLE FOR THE FRENCH ARMY.—THE LEBEL MAGAZINE RIFLE.

Incandescent Gas Lighting.

Of the new fields of usefulness for gas companies which have been developed since the introduction of the electric light first threatened to seriously affect their business, that of incandescent gas lighting has been watched with no little interest, and now seems to offer every promise of commercial success. Incandescent gas lights, so-called, from the start appeared to be of a character which would enable them to successfully compete with electric lamps of the incandescent type, and, while some of the early attempts at putting them into use were not in all respects successful, the results indicated pretty clearly what might be ex-

pected of them with the improvements suggested by even a brief experience. Probably one of the first lights of this class shown in practical work in this country was that devised by Mr. Fahnehjelm. It was exhibited, as we remember it, somewhat over three years ago, at a New York meeting of the American Institute of Mining Engineers, and apparently demonstrated that the problem of utilizing the great intensity of combustion of water-gas could be solved in a very simple manner. Mr. Fahnehjelm's apparatus consisted essentially of an iron frame placed over an ordinary gas burner. In the top of this frame, so arranged that the flame from the burner impinged upon them, were two parallel rows of needles, a short distance apart and looking like two very coarse combs placed side by side. The needles consisted of magnesia very highly compressed under hydraulic pressure and then baked at a high temperature. The heat of the burning water-gas caused the needles to become incandescent, and the resulting light, in every way equal, and in some respects superior, to that from an electric incandescent lamp, was naturally much more satisfactory than that supplied by ordinary illuminating gas. The magnesia needles were adjust-

able and could be raised or lowered according to the size of the water-gas flame and the degree to which they became worn by the intense heat. As to the cost of the light—an important consideration—it was stated that the magnesia combs would bear about 80 hours of active service and cost only from 2½ to 3 cents apiece, while the water gas could be supplied at 50 cents per 1000 cubic feet, leaving, at this figure, considerable margin for profit. The gas consumption was stated to be no greater than with coal gas. A Chicago company was subsequently formed to develop the system, though up to the present the light has not been extensively introduced.

Greater success appears to have attended what is known as the Welsbach burner, which is in the hands of the Welsbach Incandescent Gas Light Company, of Philadelphia, and of which we give several engravings. Before describing this burner, to which we already had occasion to refer when it was first brought out abroad, it may be interesting to note that incandescent gas lights in general have been found to fail because the material to be acted upon by the heat of the gas usually was present in considerable mass and re-

ing at the incandescent electric light. The convenient shape of the mantle adapts it to use with any kind of gas with efficiency. Its steadiness renders it the perfection of light for reading or fine work at night. It should be noted that ordinary illuminating gas is used, though the burner can also be employed to great advantage with both fuel and natural gas. The mantles can be made so as to give a white light or a yellow light of any degree, and a white light could therefore be furnished where it was required for special manufacturing or other purposes, and a brilliant, so called 1 per cent. yellow light for the usual domestic purposes. We understand that the results obtained with this burner applied to natural gas and to manufactured fuel gas have been most flattering, an efficiency of from 10 to 12 candles per foot of gas burned being readily attained. In the matter of economy it should be observed that the only part of the lamp that will require renewal is the mantle, and as the mantles, under ordinary care, will last for periods of from 800 to 2000 hours, and can be renewed at a small cost this item affects the economy of the system only in an insignificant degree. In practice the

THE WELSBACH INCANDESCENT GAS LIGHT BURNER.

quired a very high temperature to be brought to the required state of incandescence. In the Welsbach burner this point has been very carefully considered, as its method of preparation will show, which is briefly this: Cotton thread is knitted by machinery into long lengths of stockinet. This is cut to suitable lengths for the lamp mantles, very carefully cleaned from all foreign matter, and is then dipped into a solution of salts of the metals lanthanum, zirconium, yttrium and several others. When dry, a platinum wire is run through the hem of the mantle, and it is hung on a wire arbor. The cotton is then ignited and carefully shaped while burning. After an hour or more of burning in a Bunsen flame the mantle is completely oxidized. The cotton has gone off as carbon dioxide, and the oxides of the metals remain in the same reticulated form and fibrous structure that the original cotton had. The mantle is mounted on a light gallery to take an ordinary argand chimney, and placed over a Bunsen burner. Immediately the gas is lighted, the mantle glows with a soft, steady, yet brilliant light, which emanates from its entire surface, and does not produce that painful effect of branding its image on the retina of the eye that is experienced when look-

ing at the incandescent electric light. The convenient shape of the mantle adapts it to use with any kind of gas with efficiency. Its steadiness renders it the perfection of light for reading or fine work at night. It should be noted that ordinary illuminating gas is used, though the burner can also be employed to great advantage with both fuel and natural gas. The mantles can be made so as to give a white light or a yellow light of any degree, and a white light could therefore be furnished where it was required for special manufacturing or other purposes, and a brilliant, so called 1 per cent. yellow light for the usual domestic purposes. We understand that the results obtained with this burner applied to natural gas and to manufactured fuel gas have been most flattering, an efficiency of from 10 to 12 candles per foot of gas burned being readily attained. In the matter of economy it should be observed that the only part of the lamp that will require renewal is the mantle, and as the mantles, under ordinary care, will last for periods of from 800 to 2000 hours, and can be renewed at a small cost this item affects the economy of the system only in an insignificant degree. In practice the

mantles would require renewal about every 500 or 1000 hours. The Welsbach Company has a large factory at Gloucester, N. J., and is introducing machinery and organizing a force to make from 25,000 to 30,000 burners per day. It has erected its own fuel-gas works, and, besides the machinery and apparatus for reducing minerals, has a complete chemical laboratory, machine shop, elaborate photometrical rooms, &c. The working force is so organized that each step in the manufacture is carried on in a separate room. First comes the knitting of the mantle by machinery, and then a corps of girls attend to what is called the reinforcing or folding the mantle over at the top, so as to have a larger amount of material through which to thread the platinum wire from which the mantle is suspended. The mantle is dipped in the solution and goes through a drying room, and then to the forming room, where it is given its shape, and then to the burning-out room, where the cotton is entirely consumed, leaving the refractory skeleton of the fabric behind, preserving intact the shape and appearance of the knitted cotton mantle. It is then mounted on the brass-work or gallery, and we have the com-

pleted lamp.

Completed lamp.

plete burner. For purposes of shipment the mantle, after having been burned as described, is dipped in a solution that entirely prevents any damage in transit. At present the light is being developed for large burners, and with these, we are informed, a greater efficiency can now be secured than with the smaller ones. There is claimed to be a large saving of gas and an absence of smoke, sulphur and fumes, points which should readily commend the light to the public.

One other form of burner which has become known to some extent is that controlled by the Lungren Incandescent Gas Light Company, of New York, and invented by Mr. Charles M. Lungren. The burner is formed of a paste of refractory earth pressed through dies into the shape of fine pencils or spirals. Two different forms shown in Figs. 5 and 6, have been made, one of them consisting of a flat coil connected to a platinum wire by means of which it is suspended within the flame of a T-shaped burner. From the upper surface of this the gas issues through a double row of perfor-

tention chiefly to adapting his burner to water-gas, but, it is claimed, it may be made available for the ordinary gas supply by making the refractory frame sufficiently delicate to be raised to the necessary incandescence, by the lower temperature flame of an atmospheric burner.

We understand that there are a great variety of shapes in which the incandescent portion can be made.

The three types of burner which we have considered are, so far as we know, the only ones with which anything like practical work has thus far been done in this country. What has already been accomplished with them, however, is of a most encouraging character, and incandescent gas lighting may soon be a generally applied system of illumination.

Marine Boiler Efficiency.

In going over the question as to the commercial value of forced draft the London *Engineer* recently said:

With the exception of the Great East-

what form a boiler may take, the conditions of working are the same as though a long tube was caused to traverse the water to be evaporated, and in one end of that tube the fire was maintained, while the products of combustion escaped at the other end. The temperature at the furnace end will be so many degrees, which we shall call T , and that at the chimney end will be t number of degrees, and $T-t$ the heat imparted to the water, other things being, as we have said, equal. But so long as the heating surface remains unaltered, it is well known that as T goes up so will t . The boiler has yet to be made in which t is dependent on the temperature of the water only, and independent of that of the furnace. It may be argued that this is quite true, but that so long as the difference between T and t remain unaltered the economical efficiency of the boiler *en rapport* with the fuel will remain unaltered. But this is certainly not true, because the efficiency of the boiler is measured not by the difference between T and t , but by the difference between t and t' , the temperature of the air entering the furnace; and the larger t is the greater the waste. Those who claim that coal can be burned to greater advantage with a high than with a low furnace temperature in a marine boiler must be prepared to prove that the difference between t and t' is less when the furnace temperature is exalted than when it is low. This they have never done yet. There is not one scrap of evidence to be had in favor of such a contention.

The fight between the Messrs. Cox and the Lehigh Valley Railroad Company, says the *Philadelphia Press*, is the beginning of a contest which may result disastrously to the coal-carrying companies. They occupy a position which cannot be defended. The great mistake was to be so greedy this year as to force somebody to make a fight. After the injudicious advance in coal prices and tolls in July and August it was certain that the row would soon begin, and possibly that the whole matter would go before the Legislature next winter. The cost to the coal-carrying companies is likely, one way and another, to be two or three times as much as they have made by their short-sighted policy this summer and fall. It is true the anthracite companies for a long series of years mined and sold coal at too low a price, and that some kind of concerted action was necessary to improve the trade. When this combination was made, and especially after harmony between the Reading and Pennsylvania was established, it was thought that the good sense and conservatism of the gentlemen who control the trade would be reflected in any action that might be taken. This has not proved to be the case, and this year the control passed into the hands of time servers, who have aroused a strong public sentiment by a sharp advance in prices and a heavy charge for carrying coal, which puts a further tax on the consumer. The result will be an overhauling of the whole matter by the Interstate Commission and probably by the Legislature. If the carrying companies suffer they will have nobody to blame but themselves.

The Minerva Furnace, at Milwaukee, Wis., now operated by the Milwaukee Furnace Company, produced 2494 gross tons of Bessemer pig iron in October, on ores averaging a little under 60 per cent. During the summer, when out for repairs, this furnace was lined up to 14½ feet in diameter at the bosh, and it is only 55 feet high. It is, therefore, but a small furnace to average over 80 tons a day. The fuel consumption has been very greatly reduced this campaign as compared with the previous one.

Fig. 5.—Flat Burner.

Fig. 6.—Pyramid Burner.

THE LUNGREN INCANDESCENT GAS LIGHT.

ations. A surrounding globe protects the incandescent material from injury. A second form consists of a coil of refractory earth wound over four uprights. These uprights are considerably heavier than the coil and are designed to bear such a relation to it that the coil may burn nearly all away before they will be destroyed, thus providing against the sudden collapse of the incandescent structure. The coils are wound close together at the bottom to give the incandescent frame additional strength at this point. After the incandescent material has been sufficiently burned, it is mounted in a light metal cap having an annular gutter at its top. This gutter is filled with a plastic composition, by means of which the refractory frame is cemented to the metallic cap. There is, therefore, no occasion for touching the incandescent portion of the structure in handling it to place it on the burner. As additional security, the incandescent structure may be wrapped in paper, which will readily burn off when the gas is lighted. The burner used with this form of mantle will depend upon the character of the gas. Mr. Lungren has heretofore given his at-

tern, there is probably not a steamer afloat the top of whose funnel is 100 feet above the level of the grate bars: About 75 feet may be regarded as over the average a long way. It is not easy to say how many tenths of an inch of water this type of chimney will give, because the controlling conditions are so variable, and practically no data taken from actual practice are available. We should say that 3 inches or 4 inches will probably be over the mark at the furnaces. Now, 3 square feet of heating surface with this draft will suffice to give an indicated horse-power; and it is found necessary to provide a certain definite amount of steam room and water surface to prevent priming. Engineers have gone on year after year supplying boilers in which these proportions are observed, and the results have been very satisfactory. It is argued nowadays that they have in effect been putting more boilers, or bigger boilers, than necessary into ships; and that in effect something much less than 3 square feet per horse-power will suffice. Obviously, other things being equal, this can only be true provided more heat is caused to pass through the plates and tubes of the boiler per minute. No matter

Fire-room Practice Aboard Ship.

Referring to the failure of the steamer City of New York thus far to beat the record and the possible reason to be found in the excessively hot fire-rooms and quarters provided for the firemen, preventing efficient work, the London *Engineer* speaks as follows of fire-room practice generally:

The temperature in both boiler and engine-rooms is often needlessly high. This is due to various causes, but the most important cause is neglect of obvious precautions on the part of some one who has had to do with putting the engines and boilers into the ship. In large deep vessels the lower platforms in the engine-rooms are nearly always cool. The upper platforms, especially about the high-pressure cylinder end, are atrociously hot. There are two ways in which this can be avoided. One consists in providing ample facilities for the escape of hot air. It will not do, however, to rest content with opening skylights above the engine-room. Hot air can only get out if cold air gets in to take its place. If dependence is placed solely on the skylights or gratings over the engines, there will be a constant fight between cold air trying to get in and hot air trying to get out. Wind sail ventilators should be carried right down to the bottom of the engine-room. With their aid a constant rush up through the skylights will be secured, to the great comfort of the engineers. It is hardly necessary to add that the cold air should be distributed, not shot, so to speak, all in one place. Another means of reducing temperature consists in most carefully clothing steam-pipes and cylinders. It is a common practice, for example, to put a false checkered plate cover on a high-pressure cylinder lid. The true lid radiates heat to this until it attains nearly the same temperature as that of the steam in the cylinder. In all cases some good non-conducting material should be interposed between the false and the true lids. Many materials are available, such as sand, slag wool or asbestos.

In shallow ships the fire-rooms are usually fairly cool. Under the wind sails, at all events, a cold breeze can be found; but in deep ships the case is different. The draft down the wind sails is very local and the fire-rooms rise to temperatures of 120° or 130°. No European can work to advantage under such conditions. Much of the excessive heat is caused by radiation from the ash-pits, which might be greatly reduced by the use of screens, which have been used, we understand, with success in some foreign ships. They can be removed or replaced in a moment. Some fire doors, again, seem to be specially constructed to roast the stokers; the doors simply become red-hot. Again, sufficient care is not taken to screen the smoke-box doors and the uptakes are not half as well protected as they might be. We have heard it argued, we are sorry to say, that the expenditure of a few pounds in making things comfortable is waste of money. No statement could be more shortsighted. In the hands of the firemen lies to a great extent the success or failure of a ship intended to be fast; and money spent in making these men comfortable when off duty, so that they may get sufficient rest, is money well spent. Not half enough care is taken to provide conditions under which they can work to advantage in the stokehole. There are, of course, exceptions, but the exceptions only bring into more glaring contrast the strange neglect of everything which can add to the efficiency of the stoker manifested in other ships.

The New Jersey Zinc and Iron Company have been exploring with the diamond drill on Mine Hill, a part of the famous

Franklin and Sterling zinc, iron and manganese deposit, with success. The company own all the minerals in Mine Hill, with the exception of the Franklinite. They drilled on the Curtis property, going to a depth of 540, running into the Hill vein of iron. During the course of the drilling they struck the zinc vein in a thickness of 19 feet, samples being now in the hands of a chemist for analysis. This discovery insures them a fresh supply of zinc ore for many years to come.

Steel versus Iron for Roofing.

A controversy has been going on for some time in the columns of *The Metal Worker*, on the relative merits of iron and steel sheets for roofing purposes. It is urged that a good deal of material is sold as steel which is impure and simple, and that considerable quantities of the sheets sold as steel are compound, the belief being expressed at least in one case, that not a manufacturer of iron roofing in the United States is using a single sheet of all steel. A letter to *The Metal Worker* from E. N. Thompson, of the Thompson Manufacturing Company, Cleveland, contains the following:

We begin with tin roofing. This, as is well known, is laid in two ways: first, the flat seam in which the lock is malleted down close all around the sheet. This takes a good quality of either iron or steel to do the work perfectly. Second, the standing seam in which a lower grade of steel or iron can be used, and still do perfect work. Either of these modes of laying require a better grade of iron or steel than any iron or so-called steel roofing manufactured by any manufacturer of iron roofing. The different kinds of iron roofing and siding can be grouped into three classes, so far as quality of material to be used in their manufacture is concerned.

First—Roll roofing, in which the standing seam is made on the roof, and in which the seam is somewhat similar to standing-seam tin.

Second—Pressed standing-seam roofing, in which the caps or standing seams are a part of the sheet itself.

Third—Corrugated, crimped and beaded iron and roll-cap roofing, the separate caps of the latter being made of a better quality when made in longer lengths than the width of the iron.

Now, we assert that an all-steel sheet cannot be made by any sheet mill in the United States and sold as cheaply as iron, or a mixture of iron and steel, to do the work required of it in the above three classes of iron roofing and siding.

As bearing on some of the issues raised, one of the most prominent manufacturers of sheets in Pittsburgh, writes: "Composite sheets in the gauges you name can be made in either of three ways: one side may be steel and the other iron, both sides steel with iron in the center, or both sides iron with steel in the center. We work both of the latter two methods every day, according as the stock may require to be used." It is evident therefore that composite sheets are being made more widely than is generally known.

Exhaust-Pipes and Nozzles.—The shape and size of the exhaust-pipe and the form of the nozzle exert a wonderfully great influence on the economical working of a locomotive. Yet, strangely enough, says the *National Car and Locomotive Builder*, there have been very few exhaustive tests made to demonstrate the relative value of different forms. Since the movement began to dispense with the diamond stack with its associates, the low double nozzle and petticoat pipe, the different railroads have been working into appliances to suit the open stack that are in most cases fairly efficient for maintaining draft and for passing out the steam without back pressure; but the work of identifying the most correct dimensions has been carried on in a hap-hazard way, and on not a few roads, through mistaken notions as to the functions of draft appliances, ex-

haust-pipes and nozzles are used that must cause great waste of fuel and steam. At the last Master Mechanics' Convention a committee was appointed to investigate the subject of Exhaust-Pipes and Nozzles. The committee consists of C. F. Thomas, of the East Tennessee, Virginia and Georgia; A. W. Gibbs, of the Richmond and Danville, and G. D. Harris, of the Mobile and Ohio. The mechanical officers of the first-mentioned roads have displayed unusual interest in the subject of proper proportions of exhaust-pipes and nozzles, and both companies have experimented at considerable length to ascertain the best forms. The experiments have been continued since the convention, and it is certain that by the time for making out the report to the association arrives a mass of original data will be collected that will make the report of high scientific value.

The Iowa Jobbers and the Railroad Commissioners.—The Iowa Railroad Commissioners filed an opinion on the complaint of Burlington and Davenport jobbers, charging conspiracy and discrimination against four leading Iowa railroads. They dismiss the charge of conspiracy and sustain that of discrimination, and issue an order re-enacting their schedule which the courts enjoined them from enforcing. The board says: "The evidence on the question of discrimination in Interstate rates against Iowa shippers develops a system of rates so unjust as to be a serious blow at the business prosperity of those thus engaged in the State. The low rates obtained by Iowa jobbers from the Eastern markets are neutralized by the high local rates within the State, so that the fifth-class rate in and the fourth-class rate out are largely in excess of the class from Chicago to Iowa points, and our dealers are placed at such a disadvantage as to destroy largely their profits and to seriously cripple their business; in fact, some of them declaring that unless relief comes in a reduction of high local rates they would be compelled to leave the State and go to where they could do business at a profit. In many instances the discriminations in rates in favor of Chicago merchants are 20 to 25 per cent., and representatives of Iowa business houses find themselves at such a disadvantage as to be unable to compete, unless at a sacrifice. The result is that our business interests in Iowa are languishing and the field is given up largely to Chicago dealers. What is true of the Iowa jobbing interests is largely the case in reference to the manufacturing interests of the State. From careful comparison of the rates and the testimony in this investigation the commissioners are of the opinion that a fair reduction of local rates within the State is the proper remedy for the protection of Iowa interests against the injustice they are subjected to from discriminating Interstate rates." The opinion is signed by Commissioners Smith and Campbell. The other commissioner, Mr. Dey, says he has been threatened by the jobbers in case he did not give his opinion before November 3, and so he declines to state his views until after the election.

The Calumet and Hecla Copper Company have bought the Metalline property at a price estimated at \$500,000 upward. It was offered to Tamarack for \$500,000, and Tamarack is believed to have wanted it, but, while it hesitated, Calumet bought the lot. It is considered a valuable acquisition, and already it is surmised that the company will now surely divide its property and organize a new company. That may happen, but does not necessarily follow. The new purchase embraces 40 acres, and lies between the Tamarack and Calumet and Hecla.

New Square Pipe Former.

A machine adapted for making square heater pipes, conductor pipe, boxes, cans, flashings, &c., has recently been placed upon the market by P. B. Calvert & Co., of Philadelphia, Pa. This machine, a general view of which is afforded by means of the accompanying illustration, is of such a character that in addition to being used in connection with a standard can be placed upon any work bench with equally satisfactory results. It is the invention of S. Y. Buckman. The machine is designed to bend iron as heavy as No. 24 gauge, 34 inches wide, and at any angle up to 90°. By means of this device we are informed that pipe 2 inches and larger in size may be formed into 30-inch lengths, perfectly straight and square. It is stated by the manufacturers that by the use of the gauge attachments all the bends can be made without first laying off the sheets. The machine is carefully constructed and its principal features are the

property immediately prior to the assignment, or on the ground that all or some of the preferences were bogus. Then there occurred a change in the manner of failing; and debtors resorted to confessions of judgment, which were invariably given for alleged borrowed money advanced by wives, brothers, fathers and even sometimes by mothers-in-law.

Under confessions of judgment, the sheriff would take possession of the stock of goods; and the only ready remedy for the merchandise creditors to pursue was replevin. But herein the creditors often showed as much dishonesty as the debtors, by claiming, under their writs of replevin, goods never sold by them, and which they had no moral right to take. These replevin proceedings often depleted the stock in the sheriff's hands to such an extent that very little was left to apply on the confessions of judgment, and again the debtor and his "confidentials" were foiled. But the system of giving preferences worked so much harm to the honest

debtor, and that radical changes should at once be made.

A lawyer who for the last ten years has made a specialty of commercial features, when questioned as to what changes ought to be made in the law in order that the creditor class should not suffer, suggested that the insolvency laws now existing in the New England States, which effectually prevent preferences and fraudulent disposition of assets, should be adopted here; that the books of the debtor should at once, upon the failure, be deposited with an officer appointed by the court, and if the books did not honestly account for all the assets the debtor should be deemed guilty of fraud, and imprisonment the same as for a misdemeanor should follow; that all modes of preference, either by confession, bill of sale, mortgage or assignment, should be abolished, and a creditor be at liberty, without first procuring a judgment, to bring an action to set aside and examine into all of the debtor's transfers made within one year of the failure; and, generally, that our criminal laws should be amended so that commercial fraud of all kinds could be dealt with as severely as crimes against the person and the public welfare. He said that imprisonment in Sing Sing of one fraudulent debtor would do more to check dishonest failures than all the civil remedies now on the statute books.

To illustrate the facility with which frauds of this class are committed, a single instance will suffice. A creditor, finding his debtor backward in his payments, called upon him, and was promised a settlement on the following day. He called the next day, and found that during the night the debtor's place of business had been destroyed by fire. Being assured by the debtor that there was sufficient insurance to pay all debts, the creditor, who was a director in several insurance companies, brought about an immediate settlement of the loss, and, upon learning that the fire-insurance companies had paid the debtor, called upon him once more and congratulated him upon being able to reopen his business. Incidentally the creditor asked for payment of his claim, and was stunned by the debtor telling him that he could not pay, and that "the money from the insurance belonged to his wife by her first husband." The enraged creditor then called the debtor all the bad names he could command, and the debtor, apparently unconcerned, replied that he hoped that after the business had been run in his wife's name for a few years he could make a settlement of 25 cents on the dollar, and that the creditor might then hear from him.

NEW SQUARE PIPE FORMER.

basis of patents which are now pending. The weight of the machine is only 75 pounds.

How Men Fall in New York.

The eminent writer on economics, Edward Atkinson, has said that "nine out of ten men who engage in business fail." If this is so, the question naturally presents itself: How do they do it? This question, which is of equal interest to creditors and failing debtors, is answered by a writer in the *Tribune* as follows:

After the Bankruptcy law was repealed, failing debtors could, under the law of this State, make preferences in general assignments to the full extent of their assets. As a consequence, there were very few assignments made which did not contain preferences that covered all the debtor's property; and general creditors, as a rule, received no dividends whatever. These preferences were largely given to relatives and friends for alleged borrowed money, and the merchandise creditor would invariably be told by the debtor that the "confidentials" had to be taken care of. After awhile the merchants began to attack such assignments, and many were set aside for fraud in the disposition of

creditor class, that last year the Legislature passed a law allowing preferences in general assignments only to the extent of one-third of the actual assets; and since then it has been a serious question whether confessions of judgment or any other mode of preference beyond the statutory limit can be valid. For this reason the failures that have taken place since the enactment of the anti-preference law have been characterized by the grossest fraud, and the rule is that when a failure is publicly announced the stock of goods has disappeared, and to-day it is a common occurrence for debtors to owe upward of \$50,000 for merchandise bought within four months of the time of failure, and yet to not have on hand \$2000 of merchandise. A clothing dealer failed on Broadway a fortnight ago, owing \$40,000 to different merchants; and not a single dollar's worth of goods was found on hand. This fraud was so palpable that the debtor fled to Canada to avoid criminal warrant for his arrest. A recent canvass among the wholesale woolen merchants in the dry goods district disclosed the astonishing fact that they have not averaged a dividend of 15 cents on the dollar out of their bad debts for the last ten years; and they all complain that the laws and present decisions of the courts of this State

The Boston *Herald* presents a table showing the advance in 12 copper properties in which Boston is interested since January 1, present prices being taken rather than the highest price.

	Points advance.	Amount advance.
Allouez.....	37½	\$310,000
Atlantic.....	5½	235,000
Boston and Montana....	31	3,100,000
Calumet and Hecla.....	120	12,000,000
Central.....	2	40,000
Franklin.....	3	120,000
Huron.....	2	80,000
Kearsarge.....	8	400,000
National.....	61½	260,000
Pewabic.....	2½	105,000
Quincy.....	26½	1,060,000
Tamarack.....	56	2,800,000

Total 12 stocks.....\$20,510,000
One stock, Osceola, is omitted, because there has been almost no change in the value of its share capital.

During the first seven months of the present year the exports of Chili have reached \$7,000,000 more than during the same period of last year.

THE WEEK.

A strike in the Australian coal mines, which has rendered useless a large amount of ocean tonnage, on account of the dearth of fuel, has at last terminated. This event is expected to have an appreciable influence in reducing rates of freight, which, of late, have reached exorbitant figures.

The Westinghouse Electric Company, of Pittsburgh, have been awarded the contract for a central station plant in the city of London, England. The contract calls for 25,000 16-candle power incandescent lamps, and is much larger than any contract previously obtained by this company.

Copper mining in Mexico, stimulated by increased prices for ingot metal, is at present very active, and a belief is expressed that the output can easily be increase tenfold.

The rate in New York for the present year is \$2.22 per \$100 on real estate. Tax Commissioner Coleman believes that it will not exceed \$2.20 next year. In Brooklyn the rate is \$2.72, against \$2.76 last year.

Another substitute for jute bagging has been found in the interior bark of the cotton plant, which is readily and easily decorticated, and can be manufactured into bagging and cloth for bags by the machinery used in the jute mills.

The United States Consul at Tahiti reports to the Department of State that the new tariff for that island has been vetoed, which action renews the old 13 per cent. tariff.

Of the total arrival of vessels at this port from foreign countries during October, numbering 455, only 117 were American, against 233 British. The number of vessels in port is 408, of which 57 are steamships and 50 ships.

The report of the Lighthouse Board recommends an appropriation of \$3,107,310 for new aids to navigation, and of \$2,292,50 for the lighthouse establishment. Among the special appropriations asked for the next fiscal year are: Sandy Hook light vessel, \$60,000; sea wall at Staten Island lighthouse depot, \$40,000; Statue of Liberty building pedestal, \$50,000.

The Governor of Washington Territory estimates the population of the Territory at 167,982, an increase of about 24,000 during the year. The taxable property of the Territory is valued at \$84,621,182, which is a gain of over \$65,000,000 in the last ten years.

The steamer Haytien Republic, which has been seized on a charge of attempting to run the blockade with arms and men on board, is owned by B. C. Morris & Co. and others, of Boston, and was built for the Haytien trade at an expense of \$100,000. Mr. Morris is positive that the boat had nothing in her cargo when she left New York that would warrant her detention or seizure. An American warship will be despatched to Hayti without delay.

The German Government proposes to resume the building of large ironclads, which was stopped after the wreck of the Grosser Kurfurst. A bill providing a credit for the building of eight ironclads will be sent to the Reichstag.

The law of 1887 requiring that railroad companies that run 50 miles or more within New York State shall do away with stoves for heating passenger cars went into effect 1st inst. At the Grand Central Depot it was announced that the law was being observed and that before long not a stove would be in use. "During the past year,"

it was said, "the New York Central officials in the passenger equipment department have been actively employed in testing various devices for heating cars by means of steam obtained direct from the locomotive, and have decided on a system combining simplicity of construction and management with the most satisfactory results. A 2-inch iron steam-pipe runs under each of the cars, connection between the cars being made with a metallic joint and a sleeve. This main pipe connects with a system of pipes inside each car, one running lengthwise of the car, with branch pipes extending under the seats. At the center of each of the interior pipes is a key by which the steam from the main pipes can be cut off, thus reducing the temperature of a single car without interfering with that of cars more distant from the locomotive, which is the source of the steam supply. Since the advent of autumn all the cars composing the trains known as the New York, Chicago and St. Louis vestibule limited and the New York, Chicago, Cincinnati and St. Louis fast express, besides a large number of the local trains running on the various parts of the road, have been successfully heated by this means."

The new Inman Line steamship, City of Paris, sister ship to the City of New York, was successfully launched. The vessel is in every respect identical with the City of New York. She will be propelled by twin screws. The engines are of the three-crank triple-expansion type, and are designed to indicate 18,000 horse-power. The boilers are nine in number, built of steel. They are each 15½ feet in diameter and 19 feet long, and work to a pressure of 150 pounds. There are six furnaces to each boiler, and are in three separate water-tight compartments, divided by transverse bulkheads. The two sets of engines are separated by longitudinal bulkheads. There are 15 separate main water-tight compartments, most of which are again subdivided into smaller spaces. The auxiliary engines number in all 37. Hydraulic power is employed to work the steering gear. The rudder is a specialty, being a patent of the firm's and adds greatly to the efficiency of the vessel should she be commissioned as an armed cruiser, owing to the improved maneuvering power. In this connection it may be stated that the vessel's decks have been specially strengthened for carrying guns, so that in all respects she will make an efficient armed cruiser.

The *Financial Chronicle* publishes a summary cabled from England of Mr. Ellison's annual cotton review, giving information as to the extent of European cotton consumption. The returns show that European spinners took 3,055,000,000 pounds of cotton during the year from October 1, 1887, to October 1, 1888, compared to 2,932,000,000 pounds in 1886-87 and 2,847,000,000 pounds in 1885-86. The increase was evenly divided between the Continent and Great Britain. The European stocks on October 1, 1888, are computed at 245,000 bales, compared to 218,000 bales in 1887 and 221,000 in 1886. Mr. Ellison estimates that to maintain last year's rate of consumption an American crop of 7,100,000 bales will be needed. The European demand for 1888-89 he estimates at 7,488,000 bales, compared to 7,277,000 during the past year, and of this amount 4,670,000 bales should be drawn from America.

Business houses that have dealings with commercial agencies will be interested in a case against Bradstreet's decided last week in Philadelphia by Judge Gordon. Crew, Levick & Co., oil merchants, sued the Bradstreet Company to recover damages for alleged untrue information furnished them. The plaintiffs had asked

the agency to give them a report of the Union Refining and Mfg. Company, of New Jersey, and they reported that the company had a paid-up capital of \$600,000 and were in good credit. On the strength of this Crew, Levick & Co. gave them credit for the amount of \$1500, which they have never been able to collect. It was alleged that the Union Refining Company were insolvent at the time the report was furnished. The judge, on a motion for a non-suit, granted it, on the ground that the contract was as if between two private people, the defendant corporation being a private and not a public one, and that Crew, Levick & Co., in signing their contract with them, had waived the right to recover on the ground which they are now striving to get a verdict. He said that if they could have proved willful or malicious negligence the circumstances would have been different.

In his annual report General Benet, Chief of Ordnance, says that the bureau expended \$1,507,382 during the last fiscal year, and that 41,130 rifles and carbines were manufactured at the national armory. Investigations have been completed relative to the determination of the charge, projectile, rifling, &c., for an arm of smaller caliber than the present service piece. It is the intention to use compressed and perforated cartridges, but as yet the powder makers have not succeeded in producing a satisfactory powder. The report says that a tract of 70 acres of land immediately outside of the city limits of Columbia, Tenn., has been selected for an arsenal, and the work of construction will begin as soon as the title is accepted.

Domestic shipbuilding shows unusual activity, and the demand for new vessels for the lake and coasting trade promises to be well sustained for a long time to come. The iron and steel vessels recently constructed for service on the lakes are said to have shown unexpected speed and strength, and to have given such satisfactory results that this superior type of vessel is likely to be most in demand throughout the next building season.

To prevent excessive production in the Pennsylvania oil fields and to sustain prices an agreement was entered into one year ago between the drillers and the Producers' Association to shut down until November 15, when another contract will be considered, with similar objects. Meanwhile the oil drillers are striking new wells in expectation of enlarging their operations.

The Interstate Commerce Commission has called upon all subsidized railroad and telegraph companies to report, as required by act of August 7, 1888, whether they are maintaining and operating telegraph lines for the use of the Government or the public for commercial and other purposes without discrimination, and whether they have made and continued such arrangements for the interchange of business with any telegraph company.

Wooden shipbuilding in the Maine yards has taken a fresh start. Ten square-rigged vessels will be built during the coming winter, besides a large number of schooners. It is announced that Arthur Sewall has made the New England Shipbuilding Company a proposition to the effect that if they will put in a plant and build an iron ship he will take a half interest in the vessel.

A cataract comparable to Niagara Falls is said to have been discovered in Colorado, and there are "several more counties to be heard from" in that great State.

Claus Spreckels' beet-sugar factory in California is running night and day, and the results are so favorable that several other refineries will probably be established.

MANUFACTURING

Iron and Steel.

Harry Darlington, a brewer and capitalist of Pittsburgh, has just leased the plant of the Elba Iron and Bolt Company, Limited, in that city, and will put it in operation as soon as the necessary repairs can be made. Between 400 and 500 men, who have been idle since the works were closed down in January last, will be given employment. The plant of the Elba Iron and Bolt Company, Limited, was operated in connection with the Continental Tube Works by a number of prominent business men and manufacturers of Pittsburgh. It is stated that the profits from the Elba plant were entirely satisfactory, but the pipe trade was considerably depressed and money was lost by the Continental Tube Company. This led to financial embarrassment, which resulted in the closing of the two plants last January. The Elba plant was built in 1862, and has 28 single puddling furnaces, 6 heating furnaces, and 4 trains of rolls (one 8-inch; one 10-inch; one 18-inch, and one muck train) and had an annual capacity of 26,000 tons of skelp iron.

It is reported that the Pittsburgh and Lake Erie Railroad Company are endeavoring to purchase the Clinton Rolling Mill, at Pittsburgh, formerly operated by Graff, Bennett & Co. If the purchase is consummated the mill will not be closed down as a consequence, but the entire plant will be transferred to the works on the upper side of Carson street.

From the Hubbard (Ohio) *Enterprise*, of the 24th inst., we take the following: "A meeting of those interested in the building of a sheet mill in Hubbard was held at the bank Tuesday afternoon, and the outlook for a plant is decidedly rosy. Hubbard will furnish \$15,000 of the capital stock, and the balance will be put in by Mr. Ward and a party of practical mechanics. Should the mill be erected it will likely be run on the co-operative plan, and a dozen of the employees will be stockholders in the establishment to the extent of \$1000 each."

James McNeil & Bro., proprietors of the Vulcan Tank and Boiler Works, at Pittsburgh, have a contract for making gas pipes for the Philadelphia Natural Gas Company which measure 36 inches in diameter, and are made from what is known as heavy plate iron, used for making tanks for boilers. Each connection of pipe is 40 feet long, and at each end it is connected together by an expansion link. Six hundred feet of this size have already been made.

A statement was recently published in the Pittsburgh papers to the effect that the Carbon Iron Company, of that city, of which Horace W. Lash is general superintendent, had made some important changes in their process for the manufacture of steel, by which the product was greatly increased and the cost of manufacture considerably reduced. We find that the statement contains very little truth. The company have always used more or less coke in their process and expect to continue its use. The firm are gradually improving their methods for the manufacture of steel, and expect to turn out a steel the strong point of which will be a superior quality.

The two charcoal blast furnaces of the Jackson Iron Company, at Fayette, Mich., are to be closed down during the coming winter. This step is made necessary by the scarcity of fuel within easy hauling distance of the furnaces, which have been in operation for many years, and have used the charcoal made from the timber cut

from the lands of the company for a radius of 10 or 12 miles from the furnace. The cost of preparing and hauling the charcoal has at last grown so great that iron cannot be made there at any profit during the winter, and for that reason the furnaces will be closed down in a short time. The charcoal kilns will be kept at work during the winter, and the furnaces will probably be put in blast again in the spring.

On Wednesday, the 24th ult., the Allentown Iron Works, of Allentown, Pa., blew in No. 1 Furnace, and on the 26th ult. No. 5 Furnace was blown out for repairs. The latter stack will be relined and put in blast as soon as possible. This firm have three blast furnaces, Nos. 1, 4 and 5, No. 1 being the only stack in operation at present.

We are informed that the report that the Bellaire Nail Works, of Bellaire, Ohio, had recently introduced a new system of making steel by which they were enabled to dispense with the services of 40 men is without foundation.

The Blakeney Foundry Company, of Springfield, Ohio, have recently made an addition to their foundry, 100 x 50 feet, which has almost doubled its capacity. The firm employ 85 men, and report plenty of orders on hand. The firm manufacture principally castings for railroad work, and are at present engaged in a large order for Chicago cable roads. About 30 tons per day are being produced, of which 20 tons are for these cable roads.

The blast furnace of the Wheeling Iron and Nail Company, of Wheeling, W. Va., which has been idle for some time undergoing repairs, has resumed operations. The repairs and improvements of the furnace have been thorough; three of the four hot-blasts were torn away, and two new ones with increased capacity were erected, which are expected to add to the output of the furnace.

About 700 men will be employed in the converting and blooming departments of the new Bessemer steel works now in course of erection by the Allegheny Bessemer Steel Company, at Duquesne, Pa. The employees in the last-named department will be very few, as the entire mill will be operated by machinery. There will be only one man at each train of rolls. He will control the "piece" or bloom by means of hydraulic levers, thus dispensing with the service of a large number of employees who are required in other rail mills. The converting mill cost \$300,000, while the rail and blooming plants cost \$600,000, making the entire cost of the works \$900,000. The company at the commencement will have to purchase all the pig metal used from outsiders, but it is the intention to erect two blast furnaces close to the rail mill. It requires the product of two furnaces to keep the mills supplied. The work on this improvement will likely be commenced in the early spring.

Machinery.

The Reliance Gauge Company, of Cleveland, report rapidly growing demands for their safety water columns from all parts of the country. Among the orders recently booked are 32 for the Reading Iron Works, of Philadelphia, Pa., 10 for the California Electric Light Company, of San Francisco, 6 from Australia and 3 from the City of Mexico. Among the large concerns who have recently adopted these safeguards are the Whiteman Paper Mills, of Danville, N. Y., and the Fall Mountain Paper Company, who are placing them in their several mills, located in Vermont, New Hampshire and Massachusetts.

The Laidlaw & Dunn Company, of Cincinnati, Ohio, have carried off a number of medals at the centennial exposition, one of

them being for their well-known standard Duplex steam pump.

Messrs. Lodge, Davis & Co., Cincinnati, Ohio, report under date of 1st inst., large orders for tools and machinery for the Long & Allstatter Company, of Hamilton, Ohio; the Missouri Pacific Railway Company, St. Louis, Mo.; the East End Gas Works, Cincinnati, Ohio; the Hoffman Machine Company, Detroit, Mich., and the Eagle Iron Works, Detroit, Mich. Two carloads of machinery were sent to San Francisco last week.

The Hill Clutch Works, of Cleveland, Ohio, have opened a branch office at Kansas City, Mo., at 1221 Union avenue, under the management of Mr. A. M. Morse, who has for years been engaged in that section in engineering and machinery business. They now have branch offices in New York, Chicago, Minneapolis and Kansas City, with general office at Cleveland. They have just contracted to put in a complete outfit of power transmission machinery according to their designs for the New Bedford Gas Company, Massachusetts, and are also making extensive additions to their own works. The Niles Tool Works, of Hamilton, Ohio, have orders now in hand for them for one 10-foot boring and turning mill, also for a 5-foot mill.

Boys, Porter & Co., Limited, proprietors of the Connellsville Foundry and Machine Shop, at Connellsville, Pa., report plenty of orders on hand. They have recently made large shipments of machinery to Southern and Western points. An enlargement of the plant in the near future is contemplated.

George Westinghouse, Jr., of Pittsburgh, has purchased almost the entire capital stock of the Waterhouse Electric and Mfg. Company, of Hartford, Conn. This gives the Pittsburgh company a large interest in the arc light business, as the Hartford company have now over 3000 lights in use.

The Davenport Foundry and Machine Company, of Davenport, Iowa, write us as follows: "We are quite busy in our works and are getting out ten fly-wheels 14 feet diameter, weighing each about 18,000 pounds; ten large disk cranks and couplings, &c., for the Davenport Water Company; also a large lot of castings for the Hawkeye Electric Mfg. Company, who are locating here. They will have their works in operation December 1. Beside this we have 12 engines under way and a lot of job work."

The Machinists' Supply Company, of Chicago, Ill., have just issued their catalogue No. 2, devoted, as the name of the company implies, to machinists' tools and supplies such as are now in use in general shop practice. It embraces nearly 800 pages, and is illustrated throughout, brief descriptions also being given and tables of sizes and prices added. We have no doubt that it will prove very useful to those for whom it is specially intended.

Hardware.

The Hartman Mfg. Company, of Beaver Falls, Pa., are shipping large invoices of wire mats to foreign countries.

The Scotford Mfg. Company, of Kenosha, Wis., have begun the erection of buildings for the purpose of manufacturing brass novelty goods. They will introduce the latest and most approved machinery for this purpose.

The Kenosha Mfg. Company have been organized with a capital of \$40,000, and will erect a plant near that of the Scotford, above mentioned. G. M. Simmons is president; James Cavanagh, vice-president, and William W. Strong, secretary. They will put up two buildings and will manufacture brass utensils and novelties.

E. T. Barnum, Detroit, Mich., is filling a large order for ornamental wire and iron-work going to Sydney, Australia. This foreign trade, we are advised, has been for a long time an important part of his business, his goods being well known in the colonies.

About August 1 the Findlay Rolling Mill Company, Findlay, Ohio, purchased the plant of the Stirling Chain Company, of Cuyahoga Falls, Ohio, and removed it to Findlay, where they are operating a rolling mill for the purpose of making a uniform high quality of iron such as they require for the manufacture of axes, hatchets, adzes, mattocks, picks, grub hoes and chain. They now have their plant in active operation, working 34 fires on coil and cable chains $\frac{1}{4}$ to 2 inch. Their building is 150 x 35 feet, with additions of 16 x 20 for engine and boiler room and 20 x 46 for link room. Their entire plant is operated with natural gas as fuel, which, they advise us, enables them to make unusually clear and perfect welds. Their capacity in the chain department is 10 to 12 tons per day.

The Gate City Stone Filter Company, have, as usual, an extensive exhibit this year at the American Institute Fair. Their space is near the right-hand corner of the main hall, and is one of the first the visitor comes upon when entering the building. The goods of this company are very generally known and hardly anything more is necessary to be said than that they show their Filters and Coolers in all styles and finishes. From the very plainest Filter to the most ornamental style of porcelain, all grades, sizes and styles are exhibited.

The J. H. Pocock Can Company, Second street and Frankhn avenue, St. Louis, Mo., write us that they have just completed the purchase of 50 feet of ground adjoining their present site on the north, and have made all arrangements for erecting a new building next spring, with a frontage of 125 feet on Second street, four stories high, and running east to Waddingham street, depth of 150 feet. The new building will be equipped with the latest improved machinery, turning out work promptly and satisfactorily.

One of the first exhibits to strike the visitor at the American Institute Fair is that of L. H. Mace & Co., 111-117 East Houston street, New York, manufacturers of Refrigerators, Meat Safes, Wooden Ware, &c. The exhibit occupies a space on the left-hand side of the entrance to the hall and covers considerable ground. The various goods manufactured by Messrs. Mace & Co., are effectively distributed, and the visitor has opportunity to inspect the different styles, sizes and finishes of Refrigerators made by this concern, in addition to the other goods. A circular, specially gotten up for the fair, is distributed.

The Prescott Hardware and Mfg. Company, of Chicago, a new corporation, in which Kellogg, Johnson & Bliss, the well-known hardware dealers, of Chicago, are interested, have succeeded to the business of the Prescott Mfg. Company, of Boston, manufacturers of the Prescott patent trackless sliding door hangers for house and barn doors. These hangers have been upon the market for a number of years, and have been widely introduced throughout the country. The company's plant will be removed to Chicago after the stock now on hand is worked up. The Prescott Hardware and Mfg. Company, of Chicago, will manufacture other hardware specialties after their factory is under way in Chicago. Mathias & Knapp, Western agents of the old company, will manage the business of the new one. The trade may send all

orders to the company's main office, 108-110 Randolph street, Chicago, or to the various local agents of the old company, whose contracts have been assumed by the new company.

Growth of the Marine Engine.

In a paper on "The First Century of the Marine Engine," recently read before the British Institution of Naval Architects, Prof. Henry Dyer follows the development of the engine in a very interesting manner. We extract from it the following:

For the first 20 years after the establishment of ocean navigation the side lever engine was employed almost entirely in the larger mail packet companies, and was essentially Watt's engine, modified in some details. The Americans used, and to a large extent still use, the ordinary beam engine for paddle steamers, but in Britain, in order to economize space and keep the center of gravity of the engines low, they were inverted and thus became what were called side-lever engines. Some of them were magnificent specimens of architecture, but engines of this type were by no means self-contained, the keelsons and framing of the vessels being largely relied upon for resisting the stresses arising from the action of the engines, and of course under such conditions a low pressure of steam and uniformity of motion were matters essential to their safe working. The pressure of steam was generally from 3 to 5 pounds and seldom exceeded 10 pounds on the square inch above the atmosphere, while the space occupied in the hull by the engines and boilers was nearly one-third of the ship's length. No trustworthy figures can be found to show the consumption of coal, but for the period mentioned it was seldom less than 7 pounds per I H.P. per hour. In a few cases horizontal engines were placed between the paddle-wheels, but these were objectionable on account of the weight they caused to be placed on the deck. To obviate this difficulty the steeple engine was designed by David Napier, and continued to be used for many years, especially by river steamers. It is now, however, seldom made, the direct-acting diagonal or the oscillating engine—which was first designed by Penn, in 1837—being generally employed for paddle steamers.

When the screw propeller was introduced, chiefly through the exertions of Mr. F. P. Smith and Bennett Woodcroft in this country and Captain Ericsson in America, the same kind of engine was used for driving it as was employed for paddle vessels, the connection between the crank and the propeller shafts being effected by means of gearing. The first British steamer of any size fitted with a screw propeller was the *Archimedes*, 237 tons, and built on the Thames in 1839. It was tested under Admiralty supervision, between Dover and Calais, with the fastest paddle-wheel mail packet on the station, and so satisfactory were the results that the Admiralty felt justified in introducing the screw propeller into the Royal Navy, and they led to the construction of the *Rattler*, which was launched from Sheerness Dockyard in April, 1843. The *Rattler* proving satisfactory, several other screw vessels were built for the Navy. In the merchant service, also, the screw propeller made slow progress. The *Great Britain*, built in 1843, was the largest vessel of that day, and was remarkable not only for her size, but also because she was built of iron and was propelled by a screw instead of paddles. She was 322 feet over all in length, 48.2 feet in breadth and 31.5 feet in depth, with a gross tonnage of 3270. She was built at Bristol from the designs of Brunel, her engines were made by J.

Penn & Sons, Greenwich; her boilers by Fawcett, Preston & Co., Liverpool, and her engines were secured to the propeller shaft. The *Great Britain* made her first trip across to New York in 15 days, and afterward for many years was well known on the Australian trade. As screw propulsion became more common gearing was gradually dispensed with and the direct-acting inverted or horizontal engines were used. These may be looked upon as the normal type of engines for the larger vessels employed in the merchant service and the Navy respectively.

For a considerable time after the establishment of ocean steamship trade little attention was paid to the direct economy of fuel, although various causes, such as the improved form of the hulls, the use of iron in their construction, and the introduction of the screw propeller, led to a greater tonnage being propelled with the same amount of coal. There seemed to be a very general belief that high-pressure steam was not only unnecessary, but was positively a disadvantage and a danger. Gradually, however, this opinion changed as the necessity arose for extending trade to foreign countries where coal could not be readily obtained, and the pressure of the steam was gradually increased, although in many cases this seems to have been brought about in consequence of greater confidence in the materials of construction than from a distinct knowledge of the principles involved. Among those who led the way in the design and construction of engines of a more economical type the names of John Elder, Charles Randolph, and John M. Rowan deserve to be specially mentioned among Clyde engineers.

On the trial trip, and during many years' subsequent service, the consumption of coal in these steamers was from 24 pounds to 3 pounds per indicated horse-power per hour—a degree of economy never before realized in marine engines, amounting as it did to a saving of from 30 to 40 per cent. of the coal previously burned by steamers of the same class. This success induced the company to have their whole fleet fitted with engines of the same type, as to them the question of coal economy was of vital importance, owing to the great cost of sending coal to the Pacific stations. The next set of engines made for the company was of exactly the same size, and was worked with the same pressure as the engines of the *Valparaiso*, but with the difference that they were steam-jacketed all over, instead of merely at the ends, and the result was that the indicated power rose from being under 900 to 1150 horse-power—a result which shows the advantage of the steam-jacket if used under proper conditions. For a good many years, however, little progress was made by the compound engine, except with the company who had introduced it. Some others had compound engines made by various makers, but bad design prevented them from being as successful as they ought to have been, and in a few cases they were taken out and replaced by single-cylinder engines. Moreover, the engines of the *Woolf* type, designed by Randolph & Elder, were not fitted to give the highest efficiency, and it was not till the "receiver" type of engine, with cranks at right angles, was introduced by Nicholson and brought prominently before the public by E. A. Cowper, that the compound marine engine became almost universal in the merchant service. Until about 1868 or 1870 the inverted direct-acting two-cylinder simple engine held the place in the mercantile marine formerly occupied by the side-lever engine. At these dates, however, the paddle-wheel had been almost entirely superseded by the screw in the propulsion of ocean-going steamers.

The Iron Age

New York, Thursday, November 8, 1888.

DAVID WILLIAMS, - - - PUBLISHER AND PROPRIETOR.
CHAS. KIRCHHOFF, JR., - EDITOR.
GEO. W. COPE, - - - ASSOCIATE EDITOR, CHICAGO.
RICHARD R. WILLIAMS, - - HARDWARE EDITOR.
JOHN S. KING, - - - BUSINESS MANAGER.

The result of the election will be received with satisfaction by the majority of the readers of *The Iron Age*, because it puts at rest for a long time to come a question which has been eagerly discussed during the past few months. Protectionists will feel that the victory won was not dearly bought at the cost of the temporary suspension of business and the halt in all markets for some time past. The contest has educated a very large number of our citizens on the main issue, and has made business men and the workers familiar with many facts which have strengthened their position on the tariff. No one will doubt that in the future they will be able to grapple far more intelligently and therefore more successfully with questions affecting the business interests of the country. It has broadened their views and extended their knowledge. These are achievements which should not be valued lightly. The community will at once return to the active prosecution of its daily work. We look to an almost immediate quickening of the pulses of commerce. We know that in the fields which *The Iron Age* watches closely a very large amount of business has been in abeyance. Buyers and sellers alike have hesitated for months, although it was acknowledged that with the exception of a few lines the features of the situation warranted a brighter future. When the political excitement began to run high the advancing tendency witnessed during the summer was lost, and the markets have been stationary for two months at least. A thorough search for the causes of this halt failed to develop any other than that named. Now that it is removed, the only reason for doubting is out of the way, and the trade looks forward to a bright future.

The Outlook in the Steel Trade.

The most striking phenomenon in the steel trade during the current year has been the constant decline in steel rails coupled with an advance in the raw materials. The statistics for the first half of the current year showed that the consumption of foundry and mill pig gained slightly over that of last year, the production having been 1,806,792 gross tons for the first six months of 1887, against 1,841,584 tons for the corresponding period this year. We know that since then there has been a notable improvement. We know, furthermore, that there is coupled with this a very important fact, the rapid growth of the use of steel for other purposes than rails. Add to this the no less significant circumstance that we imported far less raw material this year than we did in 1887. Roughly, we made 400,000 gross tons of Bessemer pig less in the first six months of 1888 than in 1887, but, on the other hand, we imported

142,000 tons less of pig iron. Probably not less than 100,000 tons of this was Bessemer pig. We imported 275,000 tons less of iron ore. Let it be assumed that the two represent together about 425,000 tons of iron ore mined at home instead of abroad. Now, the falling off of 400,000 tons of domestic Bessemer pig produced would represent a decline of the demand upon our mines of say, 650,000 tons. As shown above, lessened imports compensate for 425,000 tons thereof, leaving only, roughly, 225,000 tons less of domestic ore called for by our furnaces.

Let us regard the matter in another light. It is true that the production of rails fell off from 1,023,320 tons during the first half of 1887 to 692,197 gross tons for the first six months of 1888, a decline of 331,123 gross tons. These are the figures of Mr. James M. Swank which include all the mills. Those of the Board of Control of the Rail Association stood, for shipments, 907,351 tons and 585,558 tons, a decline of 321,793 tons. The last data up to October 1st are: Shipments in 1887, 1,390,825 tons; in 1888, 921,363 tons, a falling off of 469,462 gross tons. It is, therefore, safe to say that up to October 1st the quantity of rails produced had declined by 475,000 tons. This is sure to be swelled to 600,000 tons by the end of the year; but we imported 137,500 gross tons of rails last year, while this year we shall import not more than 67,500 tons, leaving the deficit 530,000 to 550,000 tons. To offset this we must note that the imports of steel blooms, slabs and billets are not likely to be more than 100,000 tons, if it does reach that figure, as compared with 310,000 tons last year. This would leave a deficit of about 300,000 tons of steel, considering the lessened imports of wire rods, &c. Against this quantity we must write off the increased amounts of steel going into nails, shapes, plates, &c., not affected at all by the cessation of imports of the cruder materials.

It will be seen that it would be very dangerous to draw direct conclusions from the condition of the rail trade upon that of the raw materials entering into it. They have been relatively benefited more from a restriction of imports of iron ore, pig iron and crude steel. That particular part of the ore producers and pig-iron manufacturers marketing material suitable for Bessemer purposes may find the demand from other quarters grow to such dimensions that they will be relatively independent of the rail manufacturers. The dominating influence of the latter may be less prominent. It will not take a very great development of the demand for barb wire, nails, plates and shapes to bring orders enough to the Lake mines and the other Bessemer ore producing districts to crowd them up to the record of 1887, and above it. The unexpectedly favorable result this year, so far as tonnage is concerned, was due to the very circumstances to which we refer. It is therefore not beyond the possibilities that we may have a very active demand for Bessemer ores for 1889, in spite of a slack year for rails. In other words, it is a contingency which the trade should keep in view, that ores and freights might be advancing in spite of a stationary market for steel rails.

The opinion is often expressed in trade circles that if the next were only a normal year for rails, say with a mileage of 8000

to 9000 miles, the demand thus created, added to that already existing outside of railroad circles, would cause a very rapid rise in values. There is nothing to hinder it so far as the foreign markets go. They are moving along in a satisfactory way independently of us. Besides, freights all over the world are high, so that thus an additional feature is added to the security of our position.

The Ericsson Submarine Torpedo Gun.

Now that so much attention is centered in the building up of a new United States navy and in the development of appliances of modern destructive warfare, it is not without interest to trace the history of some inventions in this line which have been made in recent years, but which, so far as is known, have never been given much opportunity to practically demonstrate the claims of superiority made for them. Some of them, it is true, have been so manifestly absurd as to make more than a brief examination of them a waste of time, while others have contained the germs of practically successful machines, and still others, from the start, commended themselves as appliances which promised immediate success, but which, from a variety of causes, have been allowed to remain unused. Perhaps the most striking example of this is to be found in the submarine torpedo gun of the veteran engineer, Captain Ericsson. The merits of this weapon have, at different times, been demonstrated in the boat Destroyer, built by Captain Ericsson himself, and it seems strange that no provision was made long ago for its use in our navy. Favorable action by Congress, so far as the adoption of the plans of the Destroyer were concerned, would have not only secured a formidable means of offense and defense, but would have been but a just tribute to its illustrious designer.

No doubt there are some of our readers who recall the fact that some two or three years ago one of Captain Ericsson's submarine guns was built at the Delamater Iron Works, at New York, for the English Government. We watched it in its different stages of construction, and witnessed some of the tests before shipment. Since then nothing has been said of it. English papers chronicled its safe arrival in England and referred to the test firing to which it was to be subjected; but that was all. It may, therefore, be of interest to say now that through injudicious management on the part of the English Board of Officers, the explosive charge of one of the projectiles, after a few shots had been fired, became ignited before the projectile had cleared the gun. Its destruction completely put an end to all further experiments. Since that time, so far as we know, nothing further has been done with it. Through a peculiar coincidence the accident occurred at about the time that Congress was considering the advisability of building a number of vessels of the Destroyer type, a circumstance, which though little known has not unnaturally suggested the possibility of some connection between the unfortunate result of the blundering English trials and the failure of Congress to provide for the acceptance of Captain Ericsson's plans. Be that as it may, the gun, in our opinion, still stands unrivaled as a

means of torpedo discharge, and has, moreover, been warmly advocated by many prominent authorities, among them Admiral Porter. Further effort should be made to bring it into service.

The World's Production of Pig Iron and Steel.

We have recently been in receipt of several inquiries on the relative production of iron and steel in this country and abroad. As our readers generally will be interested in the statistics on this subject, we present herewith the most authentic figures which have been issued by Government officials and trade organizations in the leading countries of the world. In the production of pig iron Great Britain retains the lead over all competitors, although she is now being closely pressed by the United States. Germany is third in the list, but far below the two leaders. France is fourth. Belgium is fifth, but there is little difference between her and Austria-Hungary, the sixth. Russia is seventh, and Sweden eighth; these two countries being also neck and neck. Spain is the only other country whose pig iron statistics are worth separate enumeration. All other countries of the world, it is estimated by statisticians, do not together produce over 200,000 tons of pig iron annually. Taking the highest known production of each country, we have the following table in gross and metric tons, according to the system of weights adopted as the standard in the countries specified:

Maximum Pig Iron Product.

Countries.	Years.	Tons.
Great Britain.....	1882	8,586,680
United States.....	1887	6,417,148
Germany.....	1887	3,907,364
France.....	1883	2,069,430
Belgium.....	1883	783,433
Austria-Hungary.....	1884	734,346
Russia.....	1882	498,400
Sweden.....	1885	464,737
Spain.....	1885	150,225
Other countries.....		200,000

The aggregate of 23,820,763 tons is the utmost production of pig iron of which the united countries of the world have as yet shown themselves capable. Of that production Great Britain's share was 36 per cent., and that of the United States was 27 per cent. Comparing the figures of the other countries it will be found that the United States produced as much as Germany, France and Russia combined. Great Britain, however, is not keeping up her heavy output of 1882, her production having declined steadily from that year until 1886, when she produced but 6,870,665 tons, or only 453,517 tons more than the output of the United States in 1887. She rallied in 1887 to 7,441,927 tons, which is still far below the figures of 1882. Taking the actual production of each country in a given year the American Iron and Steel Association gives the world's production of pig iron as follows from 1800:

Year.	Tons.	Year.	Tons.
1800....	825,000	1880.....	17,950,000
1830.....	1,825,000	1885.....	19,100,000
1850.....	4,750,000	1886.....	20,385,571
1870.....	11,900,000	1887.....	22,170,919

In the production of steel the United States leads the world, having surpassed Great Britain in 1887. All kinds of steel are included in this comparison, the basis of which is crude steel or ingots, and not finished forms, statistics of which would

be impossible to collect. According to the American Iron and Steel Association, the following table embodies the latest authentic reports from each country, gross and metric tons being used according to the custom of the country specified:

Country.	Year.	Tons.
United States.....	1887	3,339,071
Great Britain.....	1887	3,170,507
Germany.....	1889	1,685,400
France.....	1887	440,956
Austria-Hungary.....	1887	276,920
Russia.....	1882	235,140
Belgium.....	1887	206,350
Sweden.....	1886	78,231
Spain.....	1886	25,000
Italy.....	1886	23,760
Other countries.....	35,000
Total.....		9,506,335

The United States produced 35 per cent. of this aggregate and Great Britain's share was 33 per cent. These two countries are thus closely matched in the production of steel, while Germany, third in order, falls very far behind, but is still a long distance ahead of France, which ranks fourth. In the production of Bessemer steel rails, a finished form of some of the steel included in the above table, the United States far surpasses any other country, having rolled 2,101,904 tons in 1887, against 1,021,847 tons rolled by Great Britain in the same year. This comparison gives the greatest annual production ever achieved by the United States, but Great Britain's heaviest year for steel rails was 1882, when she rolled 1,235,785 tons. As no other country makes as many rails as Great Britain, these statistics amply establish the supremacy of the United States in the steel-rail manufacture.

It would be of much interest to note the comparative standing of the various countries of the world in respect of other forms of iron and steel than those enumerated, but the figures are wanting for everything except rolled iron. In 1887 the United States turned out 2,311,160 tons of iron rolled in plates, sheets, bars, &c., while Great Britain rolled but 1,701,312 tons of puddled iron in the same forms. In castings and other miscellaneous iron products the United States undoubtedly leads, as cast iron is used here for a great many more purposes than abroad. The statistics showing the consumption of pig iron in the several countries would go far toward establishing the correctness of this statement, but into that phase of the subject we will not now enter, although from such a standpoint the United States would be incontestably proved to be the leading iron country of the world.

In his paper on "The Distribution of Internal Friction of Engines," presented two weeks ago before the American Society of Mechanical Engineers, Professor Thurston, among other sources of loss of power from friction, referred naturally to the friction of the piston and its rod. He characterized it as a decidedly variable fraction, varying not only with the class of engine, but also in the same engine when differently handled. It is not surprising that this should be so, especially when we consider the large variety of packings and packing rings with which the market is supplied, and the uncertain measure of tightness and protection against leakage afforded in the person of the average attendant. It has been remarked, facetiously, perhaps, but not wholly without foundation, that the first thing which

a new engineer will do with an engine is to set out the packing rings, and that similarly the one unfailing remedy for any slight trouble with an engine is the same setting out of these rings. That the friction of a piston should be enormously increased by such tinkering with an engine is but natural, and instances are not unknown where machinery had become almost inoperative from this cause, the friction from unduly screwed-down stuffing-boxes, moreover, adding to the difficulty. Under the circumstances the unpacked pistons and rods which are now gradually coming into use are to be welcomed as important advances in engine construction.

The World's Vessel Tonnage.

A few years since Lloyds' Register succeeded in collecting in the *Universal Register* reliable statistics of shipping for the entire world. Although not absolutely complete, they are so nearly correct that they may be used without hesitation as the basis of deductions relating to business interests. To the particular trades in which we are interested, the tonnage of the world, as affecting ocean freights, is a matter of direct and often vital importance. During the last few months those who are dependent upon foreign markets for a whole or a part of their supplies of raw material have heard a good deal of rising freights. It has come largely in the nature of a surprise to many, and the points affecting the supply of tonnage do not appear to be generally understood. The figures gathered by the authority alluded to furnish some cue to the rapid change from unremunerative rates to relatively high freights.

The total tonnage of all seagoing vessels for all countries of the world was 21,507,856 tons in 1885. It declined to 20,943,650 tons in 1886, and underwent a further diminution to 20,765,645 tons in 1887, the number of craft being in the three years in the order named: 35,408 in 1885, 35,124 in 1886, and 33,200 in 1887, all vessels under 100 tons net register being excluded. Roughly speaking, the tonnage is divided equally between sail and steam, the decline being due entirely to the decadence of sailing marine. It declined from 11,216,665 tons for 25,766 vessels to 10,402,807 tons for 25,155 vessels in 1886, and to 9,820,492 tons for 23,310 ships in 1887. So far as the steamer fleet of the world is concerned, new construction has done little more than filling the gaps caused by losses. In 1885 9642 steamers had a tonnage of 10,491,241 tons. In the next year the totals foot up 9969 steamers with a tonnage of 10,531,703. In 1887 the number declined to 9890, but the tonnage rose to 10,918,153 tons.

With such a steady falling off going on in the conveying capacity of the world's merchant marine the sudden raising of rates was not surprising as soon as anything like a fair amount of goods began to move. The shipyards of Great Britain have already responded to a sudden influx of orders for new tonnage, and the steel mills have felt its quickening influence. Good authorities are beginning to question whether the new tonnage on the stocks will not be fully adequate to bring down freights to a more reasonable level. For

the moment vessel owners are making money, after a long spell of unremunerative business.

Our own country has not changed its position much in the ranks of the ship-owning nations of the world. Taking the leading nations, the figures stand as follows:

	<i>Sailing Vessels.</i>		
	No. of vessels, 1885.	No. of vessels, 1886.	No. of vessels, 1887.
Unit'd Kingdom Colonies.....	5,114	4,881	4,112
	2,767	2,559	2,402
Total.....	7,881	7,440	6,514
United States...	3,542	3,427	3,242
Norway.....	3,969	3,200	3,010
Germany.....	1,794	1,678	1,485
Italy.....	1,674	1,679	1,508
Sweden.....	1,130	1,079	1,036
France.....	1,194	1,082	998
Greece.....	1,251	859	845
Russia.....	981	944	1,001
	Tonnage, 1885.	Tonnage, 1886.	Tonnage, 1887.

The position is not so very bad in the case of sailing vessels, but it is pitiable when comparing our steamer tonnage with that of other ship-owning nations:

It will be observed that there has been but little change in the relative position of the leading ship-owning countries of the world.

Car-Building and the Bar Iron Trade.

The car famine in the West is now beginning to bear fruit in the shape of increasing orders for new freight cars which are being placed among the car-builders. The more prominent railroad companies have led off with orders for 1000 to 1500 cars, and small lines are purchasing from 100 to 500 cars each. As car-building improves, greater activity is perceptible in auxiliary branches of industry, including some departments of the iron trade. A single inquiry recently in the market called for 2000 car axles, and this is regarded as merely the beginning of a heavy demand which will crowd the axle forges with work this winter. The car-wheel foundries will also be correspondingly active, which will be a welcome change from their condition of dullness the past summer. As a standard freight car requires about 2 tons of bar iron for its construction, it will be seen that the rolling mills will also participate heavily

in the benefits accruing from activity among the car-builders. Orders from this source will come at a good time to sustain the bar iron market, but if they should expand to very considerable proportions they will not only keep prices firm but may also cause an advance.

The Western bar mills are now making deliveries on fairly good time, showing that they are catching up with their booked orders, but throughout September and October complaints of their derelictions in this respect were numerous. Jobbers' stocks in Chicago were drawn on by the larger consumers to a considerable extent, because they could not get sufficiently prompt deliveries from the mills. Even now the large Chicago warehouses are very short of certain sizes which have been in urgent demand, and it will take some time to restore stocks to their normal condition, with the mills as busy as they are on contract work. An unprecedented quantity of bar iron is now going into agricultural implements, and the general country demand is most excellent, so that the deficiency in the consumption of bar iron by railroad repair shops has been almost unnoticed. The effect of car orders for bar iron will thus be more immediately felt than if a large part of the bar mill capacity was unemployed.

American Enterprise in Chili.

The recovery of Chili from the prostration of a destructive war has been so rapid and so substantial that already the Government finds itself with a surplus of \$20,000,000 in the treasury and prepared to engage in grand schemes for internal improvement. American engineers have been in the country since last May, carefully surveying the most feasible routes for railway construction, with the design of bringing the elevated tablelands of the interior into close communication with ports on the seacoast, and thus opening the way for an indefinite expansion of foreign commerce. The latest advices show that the Government has acted favorably upon the proposition by voting the entire amount required by the estimates of expenditure, the President confirming the act by affixing his signature to the bill. A feature in the transaction that possesses special significance when viewed from the American standpoint, and one that may reasonably be regarded with peculiar satisfaction by citizens of the United States, is the fact that American contractors were successful in securing the prize, despite the fierce competition of rivals in Europe. The amount involved is no less than \$35,000,000 or upward, no inconsiderable portion of which will be distributed among our various industrial establishments in the purchase of bridge-work, locomotives and rolling stock, it being expressly stipulated by the contractors, who are the well-known firm of Comeys & Lewis, associated with the Union Bridge Company, that these all must be supplied by manufacturers in the United States. Apart, however, from considerations of a merely pecuniary nature, there is reason for complacency in the assurance, tacitly conveyed, that henceforth the international relations of the two countries concerned must become more cordial and more intimate, thus aiding in the development of an American sentiment in distinction from

a policy purely European, and which, under certain supposable circumstances, might become arrogant and aggressive on this Western Hemisphere.

Chili has an auspicious future. Her inhabitants have not inaptly been called the "Yankees of South America." Having now an established Government and a restored national credit, and having extended its territory down to Terra del Fuego, embracing what was formerly known as Patagonia—altogether a shore line of 2270 miles—at the same time spreading eastward to the boundaries of the Argentine Republic, she seemed only to need a complete system of railway communication between the interior and the seaboard to insure a development of resources rich, varied and abundant. What the renowned American contractor, Mr. Meiggs, sought to do for Peru in her prosperous days, the rising Republic of Chili proposes to secure in her own behalf through similar instrumentalities.

The Blast Furnaces on November 1.

Again the West and South show a notable increase in the quantity of pig iron being currently made, the indications pointing to further growth. As the figures given below show, the anthracite furnaces have practically remained stationary:

Anthracite Furnaces November 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.

September 1.....	125	38,338
August 1.....	129	37,930
July 1.....	128	40,742

What changes there have been among the anthracite furnaces have practically compensated for one another. In New York one of the Port Henry furnaces, No. 3, has gone out for repairs. In New Jersey Musconetcong which was blown in lately is making more iron by 23 to 50 tons per week than in any previous campaign, producing 555 tons in one week. The Schuylkill Valley is turning iron out more heavily. Edge Hill and Lucinda are at work, and Montgomery, Mount Laurel and Norway will be added in November. In the Lehigh Valley Lehigh Furnace resumed. The two Saucon furnaces of the Thomas Iron Company have been put on magnetic ores, and are making mill iron altogether. In the Upper Susquehanna Union was about to blow in early in the month. In the Lebanon Valley one of the

Bird Coleman furnaces is out for repairs, Lochiel is idle. In the Lower Susquehanna Valley the Pennsylvania Steel Company have blown out in one of their furnaces. The probabilities point to a slightly increased make for the anthracite furnaces during the current month.

A very important increase in the capacity at work has taken place in the coke furnaces, the figures showing the following:

The Coke Furnaces November 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week. Gross tons.	Number out of blast.	Capacity per week. Gross tons.

November 1.....	151	90,459
October 1.....	152	89,123

The increase in the capacity blowing is due primarily to added plant in the South, to a greater number running elsewhere and to heavy product, notably in the Mahoning Valley.

Every furnace except one is now in operation in Allegheny County, the exception referred to being the Soho, which will go in this month. During October Edith and Lucy No. 2 went into blast. In the Shenango Valley the product has been heavy, on the whole, and practically the district is working close up to full capacity. The same is true of the Allegheny and Youghiogheny valleys, and of those furnaces which we group among the miscellaneous. Centre having resumed on the 20th ult. On the Juniata and Conemaugh, the only fact worthy of notice is that the Cambria Iron Company have resumed the manufacture of spiegeleisen, though not at the East Conemaugh furnace. In West Virginia Top Mill is again producing. In the Mahoning Valley the output has been very heavy, aggregating 38,649 tons, against 34,829 tons in September. Nearly every furnace in the valley has done better than its average. Anna, Grace, Girard, Hazelton, Hubbard and Mary notably so. Anna averaged 907½ tons for three consecutive weeks, consuming only 2116 pounds of coke to the gross ton of metal, an excellent result for its limited facilities. Mary made the exceptional record of turning out No. 1 Ohio Scotch to the extent of 92½ per cent. A number of producers note specially the active and strong condition of the market. Andrews & Hitchcock write that the de-

mand for foundry iron is so urgent that if they had bought ore for two furnaces they would blow in their second Hubbard, as they find it impossible to supply the wants of all their customers. The reports from Central and Northern Ohio similarly indicate a heavy production and a good demand. No. 2 Cherry Valley is to begin work in a few days. In the Hocking Valley one of the Floodwood furnaces is to blow in soon, otherwise there have been no changes, minor changes only have taken place in the Hanging Rock region.

In Illinois North Chicago is now running four stacks, but, on the other hand, No. 2 Union went out on the 8th ult. In Wisconsin Mayville blew in, while in Missouri one of the Missouri Company's furnaces went out, the other being blown in soon after.

No changes have taken place in Kentucky or Georgia. In Virginia, Lynchburg is to blow in on the 10th, the furnace having been remodeled. In Alabama, however, Gadsden, "B" Sheffield and Birmingham, and one of the North Birmingham (Sloss) blew in, and No. 2 Sloss resumed on the 4th ult. In Tennessee Citico is doing heavy work, and Nashville is running on coke. One Rockwood and one South Pittsburg are the only idle furnaces. Returns from the charcoal furnaces received thus far indicate that there have been only minor changes.

Corliss Valve Gearing.

Speaking of some water-works engines recently built by Messrs. E. P. Allis, of Milwaukee, Wis., *Industry*, a San Francisco journal says:

We do not indorse the Corliss valves used on the Milwaukee engines. These involve a lot of link and pin work, dash pots and other contrivance that might be dispensed with in the case of a slow-moving engine working against a uniform load. In San Francisco practice the Corliss valve gearing has been kept in its most simple form, and is in some degree, or in the same degree, better than when new detail is added. Messrs. Hicks, Hargreave & Co., of Bolton, England, for example, have in their attempts to improve or modify Corliss gear, provided apparatus that reminds one of a Jaquard loom. We are not among those who deem the Corliss system of valve gearing essential parts of a good engine. The intended functions are well performed and the valves are durable. Of this there is no doubt, but the actuating mechanism is extensive and "trappy."

The *Railway Age* says: "While few of the principal railroad companies have been doing much new building, still work has been quietly in progress on hundreds of short lines all over the land, and already new track has been laid this year in every one of the 47 States and Territories, with the exception of Rhode Island, Utah and Nevada, and almost 6000 miles of main line have been added to the railway system of the country since January 1 last. During the first ten months in the year main line tracks were laid in 44 States and Territories on 280 lines to the aggregate of 2430 miles in the four months since our last statement. Although comparatively little grading is done in the greater part of this country after November 1, still the last two months of the year are always marked by a very considerable amount of track laying, and this will be the case this year, especially if the weather continues favorable. Of the 280 lines here reported upon at least 75 are still in process of construction, while some track will be laid on a few other roads. Looking the field over we venture to estimate that from 1200 to 2000 miles more of new track

will be added to complete the record of last year, making the total new railway mileage of 1888 between 7000 and 8000 miles."

Propulsion of Ships by Air Propellers.

At the last meeting of the British Association for the Advancement of Science, a paper was read by Mr. H. C. Vogt, suggesting the propulsion of ships by means of revolving sails acting in the air. The advantage to be gained over the ordinary form of screw propulsion were summed up as follows:

(1) A saving amounting in engine power by eliminating the disturbing action of the screw; (2) the form of the ship could be determined with reference to least resistance and seaworthiness only, and the division in water-tight compartments could be complete; (3) the change in trim will be less disadvantageous when the power is applied above the deck than below the center of gravity; (4) the vibrations caused by the screw propeller, which are destructive to the ship and most unpleasant to those on board, will be avoided; (5) the proposed air propeller will utilize the natural wind power.

The air propeller, as explained by Mr. Vogt, is, in its outer shape, somewhat similar to the ordinary water screw, with sails or blades made of thin sheet steel, having the greatest width near the circumference. The pitch of the blades is capable of being varied in order to utilize the power of the wind, because nearly 80 per cent. of the winds, the whole compass round, augment the thrust of the propellers.

In order to avoid vibrations, the blades of water propellers are tapered toward the tips or near the circumference, whereas the blades or sails of the air propeller should be broadest near the circumference, because the air, being elastic, causes no vibrations. It is found in practice that for equal numbers of revolutions, equal intensity of thrust, engine power and speed, the area of an air propeller should be about twelve times that of the water screw, but this ratio decreases somewhat as the size of the ship increases.

On Friday, the 2d inst., the freight rates from Pittsburgh to Galveston and Houston, Tex., were advanced. Iron nuts, bolts, washers, rivets and staples were advanced from 54 to 56 cents per 100 pounds. The new class rates are: First-class, \$1.50; second, \$1.25; third, \$1.05; fourth, 86 cents; fifth, 78 cents; class A, 83 cents; B, 75 cents; C, 67 cents; D, 55 cents; E, 50 cents. They were formerly, \$1.50, \$1.25, \$1.05, 86 cents, 82 cents, 74 cents, 67 cents, 55 cents and 50 cents. The new figures are issued under a new classification, revised for Texas business.

The Durant Crescent route has sent out its Tariff Sheet No. 9, on rates of pig iron from Southern furnaces. By a printer's error, the first sheet sent out was wrong, and a second corrected one has been issued.

The Canadian Geological Survey, in its annual report on the mineral and metal production of the Dominion for the year 1887, estimates an output of the year at \$15,000,000. Of the aggregate exports, estimated to have been about one-third of the total product, the United States was the purchaser of 78 per cent., while England took the next largest share, 15 per cent., and Newfoundland, Germany, Sandwich Islands, Australia, Argentine and the East and West Indies followed in the order given.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, November 5, 1888.

Business has been very decidedly curtailed during the past week, the impending political struggle absorbing the attention of all classes.

Pig Iron.—The market generally has been very dull, the only sales of consequence reported having resulted from the closing of negotiations begun some time since. Among these is a lot of several hundred tons of Lake Superior Charcoal which goes to the East to be manufactured into Car Wheels and malleable Castings. The other sales were of Coke Irons to the foundry trade. A large number of consumers have stated that they would defer purchases until after election unless positive bargains were offered them. But just now bargains in Pig Iron are extremely rare, although reports are more frequent of concessions being offered on Southern Irons, particularly Gray Forge. It is asserted that any weakness in that direction is only for early delivery, and that contracts to be filled in 1889 would not be made on the same basis. The scarcity of high numbers of Lake Superior Charcoals still continues, as the furnaces are turning out a smaller proportion of those grades than usual. The Calumet Furnace is now ready to be blown in, all the repairs having been completed. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, all numbers, \$20 @ \$21; Alabama Car-Wheel, \$26.25; Jackson County Softeners, No. 1, \$18 @ \$18.50; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband), No. 1, \$20. @ \$21.; other Ohio Soft Irons, No. 1, \$17 @ \$18; Lake Superior Coke, No. 1, \$18 @ \$19; No. 2, \$17 @ \$18; No. 3, \$16 @ \$17; Southern Coke, No. 1 Foundry, \$17.50; No. 2 Foundry and No. 1 Soft, \$17; No. 3 Foundry and No. 2 Soft, \$16.25; Gray Forge, \$15.50.

Bar Iron.—As work among the car-builders increases the demand for Bar Iron improves from that source. A few good specifications made their appearance last week and much larger orders are shortly expected. Bids on Car Iron range from 1.70¢ to 1.75¢, flat, f.o.b. Chicago. The carload price for Common Iron from mill is 1.75¢, half extras, f.o.b. Chicago, but large lots and good specifications could be placed a little lower, depending on the condition of the mill quoting. As the mills generally seem to have plenty of work, no break in prices is indicated, but, on the contrary, a firmer feeling is noticeable with the increasing business in sight. Jobbers quote small lots from store at 1.90¢ @ 2¢, according to quantity and quality, but their stocks have been badly broken of late, and some of the largest warehouses in the city are at present unable to supply a complete assortment of sizes.

Structural Iron.—Business in this line has been very quiet. Mill orders run as follows, f.o.b. Chicago: Angles, 2.20¢ @ 2.25¢; Universal Plates, 2.25¢; Tees, 2.55¢ @ 2.65¢; Beams and Channels, 3.40¢. Small lots from store are quoted at the following rates: Angles, 2.35¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢.

Plates, Tubes, &c.—A fair business has been done by the local merchants, but it was mainly confined to small lots. Some large enterprises are on foot involving the consumption of considerable quantities of Plates, and the outlook is decidedly encouraging. Prices are firm, quotations from store

continuing as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢ @ 2.70¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60 ¢ off.

Sheet Iron.—The mills are quoting slightly lower prices, as they begin to see daylight through their orders, and 3¢ at mill for No. 27 is now named by most of them, although few are prepared to make early deliveries as yet. Jobbers are having a light demand, which is attributable to the very mild weather recently prevailing. A cold snap is badly needed to impart activity to the retail Stove trade, from which their demand comes. They quote small lots of No. 24 at 3.20¢, Nos. 25 and 26 at 3.30¢, and No. 27 at 3.40¢, with concessions to best buyers.

Galvanized Iron.—New business has again fallen off among manufacturers' agents, but the mills are still far behind with their orders, and stocks in warehouses are very badly broken. Small lots are quoted at 60 ¢ and 5 ¢ off for Juniata, and 80 ¢ and 10 ¢ off for Charcoal.

Merchant Steel.—Small lots of Open-Hearth Spring Steel are being sold at 2.70¢, but no large transactions have taken place in it. The demand for other forms of Steel has been quiet and association prices are as follows: Bessemer Bars, 2.80¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Orders for 20,000 to 30,000 tons were placed among the local mills during the week, the greater part being for next year's delivery. More inquiries are in the market, but they are of such a character that some members of the trade fail to derive much encouragement from them, and are not looking forward to a year of any greater activity than the present one has been. It is very certain that prices will be decidedly less remunerative. In view of this some makers are disinclined to compete vigorously for business, believing that those who do not fill their order books now will get better rates next spring or summer. The nominal quotation is still \$30 for all deliveries.

Old Rails and Wheels.—Sellers of Old Rails are more plentiful than buyers just now, and prices are lower. A small lot, consisting of a few carloads, was sold at \$22.50, and several hundred tons were sold at the same price in the interior of the State. On other lots offered the best bids received were equivalent to about \$21.75, Chicago, which the sellers rejected, believing that a better demand will be experienced later in the season. The supply is understood to be quite heavy, but holders assert their ability to wait for better prices. Old Car-Wheels are evidently being sold to consumers direct by the railroad companies, very few of them passing through the hands of third parties. Prices are, therefore, difficult to quote, but they are worth \$19.50 @ \$20.

Scrap.—An inactive condition of the market is reported, very few sales having been made. Most of the mills and forges are well supplied with stock. City dealers are holding off for higher prices, which they expect to get after snow falls, if indeed a demand does not spring up after the election. Mixed Country Scrap is quoted at \$14.50 @ \$15. Selling prices of carefully selected Scrap are as follows, per ton of 2000 lb: No. 1 Forge, or Railroad Shop, \$20.50 @ \$21; Track Scrap, \$19.50; Horseshoes, \$20; Axles, \$26.50; No. 1 Mill, \$15.50 @ \$16.50; Pipes and Tank, \$12 @ \$13; Light Wrought, \$11; Cast Machinery, \$15; Stove Plate, \$12; Cast Borings, \$9.50; Wrought Turnings, \$12 @ \$12.50; Axle

Turnings, \$14; Coil and Leaf Steel, \$17; Locomotive Tires, \$15.50.

Hardware.—Wholesale merchants have experienced an excellent demand for Shelf Hardware. The very healthy condition of this branch of trade is shown by the large number of mail orders now being received, as they are much more numerous than usual. The election will naturally curtail business to some extent this week, but as soon as it is over it is expected that a resumption of the activity will occur and that it will continue up to at least the middle of December. In Heavy Hardware a quieter feeling prevails, purchases being made very conservatively and collections being less satisfactory than earlier in the fall. No material changes in prices are reported.

Nails.—A 10,000-keg order for Steel Nails from a point further West excited some interest in the local trade the past week, but generally speaking manufacturers' agents did little or no business. They quote \$1.90, f.o.b. Chicago, but concessions on this price are being offered by some sellers, and the impression prevails that a lower range of values will be established which will probably hasten the consummation of the long-contemplated combination. Small lots are sold, from store, at \$2.05, but this is shaded to best buyers. The continuance of mild weather has benefited the jobbing trade in Nails, as outdoor work is being prosecuted with vigor much later in the season than usual. Prices of Wire Nails are much firmer than those of Cut Nails, small lots selling at \$2.60.

Barb Wire.—Jobbers report an improvement in the demand, but no change in prices, continuing to quote small lots at 2.90¢ for Painted, and 3.60¢ @ 3.65¢ for Galvanized.

Pig Lead.—Prices have fluctuated within a narrow range during the week, between 3.70¢ and 3.80¢ but considerable quantities have changed hands, being taken directly for consumption. Refiners are indisposed to push sales at the lower figures, and the market, therefore, appears firm.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St. PHILADELPHIA, Pa., November 6, 1888.

Business has been very quiet since date of our last report, but in view of the important election which will be decided within the next 24 hours, it could hardly be otherwise. Important transactions have been held in abeyance, both sides being satisfied to wait until the question is decided. Prices, however, have not weakened in the slightest, from which it is inferred that they might have been dearer if the usual demand had not been interfered with.

Pig Iron.—The feeling has been one of much steadiness, and makers have had no difficulty in disposing of all the Iron they could spare. In most cases prices have been maintained, while in some instances slight advances have been paid in order to secure certain brands or deliveries. But there is no quotable change anywhere, and for all practical purposes the market is just about as it was a week ago, although the firmness of holders leads to the opinion that it has more inherent strength than was generally expected. Sales of Foundry Irons have been chiefly in lots of 50 to 100 tons each, and ordinarily at prices ranging from \$17 to \$17.50 for No. 2 and \$18.50 to \$19 for No. 1, the bulk of the business being at the outside figures. Mill Irons have not been called for to any great extent, as they are usually taken in larger lots, thus making it more an object for buyers to see the result of the election before closing their

contracts. There have been a good many inquiries, however, and there is reason to believe that the demand will be large enough to absorb all the Iron that can be turned out during the balance of the year. For the present, therefore, prices are not likely to go below \$16 nor higher than \$16.50 @ \$17 at tide, a little one way or a little the other, according to developments during the next 24 hours. The market looks remarkably healthy and sellers appear to have entire confidence in values as above quoted.

Blooms.—There is a fair demand at quoted rates, which are unchanged, as follows: Nail Slabs, \$29 @ \$29.50, at mill; Billets, from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 $\frac{3}{4}$ "bloom" ton of 2464 lb.; Foreign at tide, c.i.f., duty paid, \$30 @ \$31 for Nail Slabs; \$34 @ \$36 for 4 x 4 Billets, and \$35 @ \$39 for Siemens-Martin, price according to analysis, &c.

Muck Bars.—The demand has been quite strong up to this date and prices fully maintained. Quotations vary according to point of delivery, quality of Bars, &c., but \$29 @ \$30, f.o.b. cars at mill, seems to fairly cover both ends of the market. The volume of business has not been large, as the offerings were light and quotations very firm.

Bar Iron.—The demand has not been equal to that met with during the earlier portion of last month, although there is still a good deal of activity, especially at the city mills. Some outside concerns seem to be anxious for new business, to secure which they have manifested a little weakness in making quotations, giving buyers better terms than were expected a little while back. There may be a reaction, however, in course of a few days. For the present, at all events, there is nothing to indicate serious dullness, and the chances are that things will go in a few days as if there had been nothing whatever to divert attention from the ordinary routine of business. Prices, as we have said, are irregular, and in some instances have shown signs of weakness, but ordinarily 1.85¢ @ 1.95¢ is quoted, with concessions of possibly half a tenth or a tenth when the order was large or desirable as to specification of sizes, &c. Skelp Iron is steady but not active. Mills are full of work for some weeks, and buyers have not felt inclined to pay over 1.9¢ for new business, although 1.95¢ to 2¢ is asked.

Plate and Tank Iron.—There are no new features to notice in this department. Small orders have been numerous, and mills are nearly all busy on work of this class. Work that was somewhat confidently expected from the shipyards has not materialized yet, and it is not unlikely that there may be further delay, as regards at least one important contract; but, under any circumstances, there will be a fair degree of activity, as most of the yards are tolerably well filled up for the winter months. Prices are unchanged, as follows: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—There is not much new business coming in at present, and some of the mills are beginning to complain of dullness in many of their departments. The outlook is not specially encouraging at present, although it is hoped that things will take a fresh start soon. Prices unchanged, as follows: 2.10¢ @ 2.15¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel

Sheet Iron.—The demand has been very satisfactory and prices firmly maintained. Mills are taxed to their utmost capacity to keep up their assortment of sizes, and stocks in first hands are at an extremely low point. Quotations for best makes are about as follows:

Best Refined, Nos. 26, 27 and 28.... 3½¢ @ 3½¢
Best Refined, Nos. 18 to 25.... 3¢ @ 3½¢
Common, ½¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28.... 4½¢ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25.... 4¢ @ 4½¢
Best Bloom Sheets, Nos. 18 to 21.... 3½¢ @ 3½¢
Blue Annealed..... 2.8¢ @ 3¢
Best Bloom, Galvanized, discount..... 62½¢
Common, discount..... 67½¢

Merchant Steel.—The demand is well maintained at prices as follows: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—There is a good deal of inquiry for Rails, and it is not unlikely that some important contracts will be closed, providing that the election is favorable. Both sides have been waiting. As regards consumption, the outlook is not encouraging, but in view of the very low prices quoted, and the comparatively high cost of production, it is quite likely that sellers will stand out for more money. Quotations are, at the moment, more or less nominal, \$28.50 at mill being an inside figure for large lots, and from that to \$29 for smaller orders.

Old Rails.—There is very little business to report in spot lots, buyers and sellers still being unable to come together. T's in store or for shipment are held at \$24, with buyers at from \$23 to \$28.50. Sales of spot lots have been made at \$24.75 for old English Trams, \$25 for American Streets, and \$24.50 @ \$25.50 for T's delivered at mills in the interior.

Scrap Iron.—The demand is well maintained, and sales are chiefly at about the prices quoted a week ago—viz.: \$21 @ \$21.50 for cargo lots; \$21.50 @ \$22.50 for carload lots, delivered, or for choice \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Nails.—The demand has been somewhat more active, and, while prices are still irregular and unsatisfactory, the feeling seems to be somewhat more hopeful. Lots from store are quoted at from \$1.90 to \$2, but (some brands) carload lots are quoted at extremely low figures for spot cash.

Wrought-Iron Pipe.—The demand is fully maintained, mills are all busy and likely to be for the balance of the year. Discounts as follows: Black Butt-Welded, 52½¢; Galvanized do., 52½¢; Black Lap-Welded, 62½¢; Galvanized do., 52½¢; Boiler Tubes, 60¢.

Geo. W. Schultz, formerly with Sites, Wheeler & Co., and later with J. C. Poulter & Co., has taken an office at 36 South Seventh street, Philadelphia, and embarked in the general Iron and Steel brokerage business as E. W. Schultz & Co. Mr. Schultz is also treasurer of the Electrical Construction Company, which concern makes a specialty of installing electric light plants and all kinds of electrical supply and repair work.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
Pittsburgh, November 7, 1888.

Business continues in a generally satisfactory condition, although it has been curtailed somewhat of late by the excitement incident to the national election.

Pig Iron.—The quietude noted for some weeks past continues, and the indications are that the market will rule steady during the remainder of the present year. Consumption continues large, but so is production, and the best-informed authorities predict that there will be no falling off in trade for some time to come, as the reports from nearly all points in this respect are of a most favorable character. Furnacemen would like to have a higher price for their product, but consumers aver that they are paying more now than they are warranted in doing, claiming that the raw material is bringing a higher price relatively than the finished product. There is scarcely a furnace in this district but is well sold up, some of them for several months ahead; but it is well to bear in mind, on the other hand, that many consumers have anticipated future wants and are out of the market, so that the one offsets the other. Prices have undergone but little change for several weeks, with the exception of Bessemer, which is off 50¢ per ton. We quote as follows:

Neutral Gray Forge.....	\$16.00 @ \$16.25,	cash.
All Ore Mill.....	16.75 @ 17.00,	"
White and Mottled.....	15.00 @ 15.50,	"
No. 1 Foundry.....	18.00 @ 18.50,	"
No. 2 Foundry.....	17.00 @ 17.50,	"
No. 3 Foundry.....	16.25 @ 16.50,	"
No. 1 Charcoal Foundry.....	24.00 @ 24.50,	"
No. 2 Charcoal Foundry.....	21.00 @ 22.00,	"
Mill Charcoal.....	19.00 @ 20.00,	"
Bessemer Iron.....	17.50 @ 18.00,	"

Ferromanganese.—Sales of 80 % Ferromanganese at \$56 @ \$57, and 20 % Spiegel at \$27 @ \$28.50, cash.

Muck Bar.—There is more inquiry, and with but little offering the market is firmer and higher; we now quote at \$29 @ \$29.50, cash. A broker reports having an order to buy a lot of 1000 tons at \$29.25, cash, without having been able to get it. The above quotations show an advance of from 50¢ to \$1 per ton within a few weeks. It appears that nearly all the mills making a specialty of Muck to sell are sold ahead.

Manufactured Iron.—There is a continued good degree of activity, and the indications are that the mills, generally, will have about all they can do until the close of the present year. Prices remain unchanged. Bars, 1.80¢ @ 1.85¢; Plate 2.20¢ @ 2.25¢; No. 24 Sheet, 2.85¢ @ 2.90¢; all 60 days, 2¢ off for cash; Skelp Iron, 1.80¢ @ 1.85¢ for Grooved, and 2.10¢ @ 2.12½¢ for Sheared. Trade in Skelp Iron usually commences to drop off this month.

Nails.—Are still quoted at \$1.90, 60 days, 2¢ off for cash, although it is alleged that Wheeling, and possibly some other points west of Pittsburgh, are cutting the card rates. Pittsburgh makers refuse to cut below card rates, which at best, they claim, offer but a very small margin for profit.

Wrought-Iron Pipe.—There is a falling off in new business, as there usually is at this season of the year, but the mills are still busy and likely to be the rest of this month. No change in prices. Discounts on Black Butt-Welded Pipe, 52½¢; on Galvanized do., 45¢; on Black Lap-Welded, 62½¢; on Galvanized, 52½¢; Boiler Tubes, 60¢; 2-inch Tubing, 13¢ @ foot, net; 5½-inch Casing, 40¢ @ foot.

Old Rails.—There is a fair demand, but no quotable change in prices; sale of 500 tons, at \$24.75, and 2000 tons, at \$25.25. Standard American Tees may be fairly quoted at \$25 @ \$25.25. As soon as the winter season sets in the work of lifting will be suspended, and this leads to the belief that there will be a stronger market in the near future, although no immediate advance in price is looked for.

Steel Rails.—We continue to quote Heavy Sections at \$28 @ \$28.50, cash, at mill. We are cognizant of a sale at \$28.25. Some of the railroads have been

buying considerable sized lots, giving Old Iron Rails in part, on a basis of \$28.25 @ \$28.50 for New Steel and \$25 @ 25.25 for Old Iron Rails. The latter came within \$2.75 @ \$3 of paying for the former. We hear of one deal of the character in question involving 10,000 and another of 3000 tons. Almost any railroad company having Old Iron Rails can afford to buy new ones in the present condition of affairs, as the old are worth almost as much as the new.

Billets, &c.—There is a continued fair demand for Bessemer Steel Billets, and the market is reported steady at \$29 @ \$29.50, cash, at makers' mill. Nail Slabs, \$28.50 @ \$29; Domestic Bloom Ends, \$19; Domestic Rail Ends, \$19.25 @ \$19.50.

Railway Track Supplies.—There is a fair business, but prices remain unchanged. Spikes, 2¢ @ 2.10¢, 30 days, delivered; Splice Bars, 1.80¢ @ 1.85¢; Track Bolts, 2.85¢ with square and 2.95¢ with hexagon Nuts. The Spike works of Dilworth, Porter & Co. are still being operated by non-union workers, and the firm express a determination to hold on firmly to the position they have taken on this point, even if they do have some trouble; they have gone into it with determination to win.

Merchant Steel.—There is a continued fair degree of activity, but no recent change in prices. Best Brands of Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery, 5¢; Open-Hearth do., 2½¢.

Old Material.—There is a very fair business in the aggregate, although the demand is chiefly for small lots to supply immediate wants. No change in prices. Sales, No. 1 Wrought Scrap, \$21, net ton; Car Axles, \$26 @ \$27; Wrought Trimmings, \$14 @ \$15; Cast Scrap, \$16, gross; Cast Borings, \$12.50 @ \$13; Old Car-Wheels, \$20; Leaf Steel, \$19, net ton.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, November 5, 1888.

Pig Iron.—Dullness has been the only feature of prominence in the local market for Pig Iron during the past week. There have been one or two large buyers in the market, however, and some contracts of moment, embracing a long delivery, are reported to have been closed. These transactions, however, were probably based upon special conditions and were the exception rather than the rule. There have been a number of inquiries, however, and "offers" based upon the political situation, but the result has been "nil." While there is generally a feeling of confidence and prices are well sustained, there is evidently a misgiving in certain quarters, and some concessions in prices have been made which point to a weaker tone. The easier feeling is said to be confined to sales for immediate delivery, while for future contracts full prices have prevailed. Prices are without quotable change. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1.....	\$18.50 @ \$17.00
Southern Coke, No. 2.....	15.75 @ 16.00
Southern Coke, No. 3.....	15.50 @ 15.75
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley.....	17.50 @ 18.50
Hanging Rock Charcoal, No. 1.....	20.50 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.50 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @ 19.50
Tennessee and Alabama Charcoal, No. 2.....	17.00 @ 18.00

Forge.

Strong Neutral Coke.....	14.75 @ 15.00
Mottled Neutral Coke.....	13.75 @ 14.00
Gray Forge.....	14.50 @ 14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	20.50 @ 21.50

Nails.—There has been a fair jobbing trade and the market has ruled steady for all kinds. Jobbing prices are based upon 12d @ 40d, which sell at \$2.10 ½ keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2.10 and Steel Wire Nails at \$2.75 ½ keg.

Manufactured Iron.—The market has been quiet throughout the week and some cutting of prices has been complained of, but no changes have been made which are considered legitimate. Common Bar Iron, 1.80¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3½¢ @ 4½¢ ½ lb.

Old Material.—There has been some inquiry for both Old Rails and Wheels, but few changes have been made in prices and transactions have been small. Old Rails are quotable at \$23, and Old Wheels at \$19 @ \$19.50 ½ ton, cash, here.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, November 5, 1888.

Pig Iron.—Nothing has occurred to change the general aspect of the market, which is moving along in a quiet and conservative manner. The general opinion seems to prevail that there will be but little change in the condition of the market whichever political party is successful in the election of their candidate, and it is, therefore, making but little difference in the calculations of our Pig Iron producers regarding the future. Demand and consumption keep about equal to the output, and but little speculation in Iron appears upon the surface. The Southern foundries are busier than usual, and consequently are requiring more than their usual quantity of Iron. The cause of this increased business is the very large crop of cane through South Carolina, Southern Georgia, Southern Alabama and Florida. It is estimated that the crop will exceed this year three times the amount of any previous year, consequently the demand for mills and pans is very great. There is also with the foundries a large increase in business in other lines, so at the present time they are having a heavy run of business. As prices have undergone no change, quotations are continued same as last.

Cleveland.

CLEVELAND, November 5, 1888.

Iron Ore.—The demand for Ore continues excellent, even the excitement incidental to a closing Presidential campaign failing to influence the market. About the only Ores still obtainable are a few lots of non-Bessemer. It has already been practically settled that but a very few tons of unsold Ore will be left on the docks at the close of navigation. Furnacemen do not look upon the present quotations as exorbitant, and negotiations are already pending for all-rail delivered Ore for winter use. All of the high grade Ore that can possibly be brought down by the lake carriers have been sold, with the possible exception of a few scattering loads that will be eagerly taken when offered for sale. Menominee Range non-Bessemer have advanced to \$4.50, at which price the closing sales for the season are being made. The transportation rate from Ashland has dropped to \$1.65, and this price will be paid for the few remaining loads to be shipped from that port. The total shipments to date slightly exceed 4,175,000 tons, a figure fully 500,000 in excess of the estimated business for the season at the opening of navigation. Including the 650,000 or 700,000 tons of unsold Ore on the docks at the beginning of the season, the total amount taken by the furnacemen this sea-

son will closely approximate 5,000,000 tons. The market for all non-Bessemer is very firm, and the persistent demand for the few thousand tons still to be used seems likely to result in advances within the next ten days.

Pig Iron.—Prices have neither advanced nor declined since last week's quotations were given. The market is, however, firm, and immediately after the election the volume of business will probably be satisfactory all around again. Both sellers and buyers are watching for the result of to-morrow's election with no small measure of apprehension. Upon the verdict given will, it is claimed, depend in a large degree the condition of the market for the next year. No large sales are reported for the past week, and none are expected before next week.

Scrap Iron.—Old American Rails have been sold quite freely during the past week at \$23.75 @ \$24.25. There is very little inquiry for Old Wheels, but No. 1 Wrought is in good demand.

Manufactured Iron.—Sheets are again quite plentiful, and Bar Iron is in active demand at prices considerably in advance of former quotations.

Louisville.

LOUISVILLE, KY., November 5, 1888.

Pig Iron.—The market has been quiet, with few large sales. These, however, have been at slight reductions in prices. Political excitement has caused some unsteadiness in Iron, and furnacemen are uncertain whether to sell at once for future delivery, or wait further developments. Foundries report orders ahead, and none are complaining of scarcity of work. The prices, however, at which contracts are taken show very little profit, and it is earnestly hoped that the market will soon show an advance. Old Rails and Wheels are quiet; Rails are worth \$23; Old Wheels, \$20.50. We quote as follows:

Southern Coke, No. 1 Foundry.....	\$16.75 @ \$17.75
" No. 2 ".....	15.75 @ 16.25
" No. 3 ".....	15.25 @ 15.75
Hanging Rock Coke, No. 1 Foundry.....	17.00 @ 17.50
Hanging Rock Charcoal, No. 1 Foundry.....	20.75 @ 23.00
Southern Charcoal, No. 1 Foundry.....	17.75 @ 18.25
Silver Gray, different grades.....	14.25 @ 15.00
Southern Coke, No. 1 Mill, Neutral.....	14.80 @ 15.00
" No. 2 ".....	13.50 @ 14.50
" No. 1 " Cold Short.....	14.00 @ 14.50
Charcoal, No. 1 Mill.....	15.50 @ 16.25
White and Mottled, different grades.....	13.25 @ 13.50
Southern Car-Wheel, standard brands.....	22.75 @ 23.75
Southern Car-Wheel, other brands.....	19.00 @ 21.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Hanging Rock, Warm Blast.....	19.00 @ 20.00

New York.

Office of *The Iron Age*, 66 and 68 Duane street, NEW YORK, November 7, 1888.

American Pig.—The week under review has been very quiet, very little business being done. We print elsewhere our monthly statistics, which show that the capacity of the Anthracite furnaces has remained practically unchanged, but that the South and West has notably increased. We continue to quote Standard to Choice No. 1, \$18 @ \$19; No. 2 Foundry, \$17 @ \$17.50, and Gray Forge, nominally, \$16 @ \$16.50.

Scotch Pig.—The market is very quiet, with prices remaining: Coltness, \$21.50, nominally; Shotts, \$20.75 @ \$21; Langloan, \$21, and Dalmellington, \$20.25 @ \$20.50.

Bessemer Pig.—There have been large purchases of Bessemer Pig in Eastern Pennsylvania, one Eastern Rail mill alone buying about 15,000 tons of Cornwall Pig from Lebanon Valley furnaces at \$15 at furnace for the three numbers.

Spiegeleisen.—No business of any consequence is reported. Importers ask \$27

for German 20 % Spiegel, \$33 for 30 % and \$54 @ \$54.50 for 80 % Ferromanganese.

Plates.—We quote Iron Tank, 2.1¢ @ 2.2¢; Shell, 2.3¢ @ 2.4¢; Steel Tank, 2.2¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.65¢ @ 2.75¢, and Fire-box, 3.5¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢.

Bar Iron.—We quote: Carload lots, half extras, 1.67½¢ @ 1.7¢ for Common; 1.7¢ @ 1.8¢ for Medium, and 1.8¢ @ 1.9¢ for Refined, with prices for fancy brands running up to 2.4¢ @ 2.5¢.

Steel Rails.—The 21,500 tons alluded to in the last issue of *The Iron Age* as having been purchased for the Vanderbilt system were not the total of the orders placed. We understand that the quantities purchased were 17,000 for the New York Central and West Shore, 8500 tons for the Lake Shore and Pittsburgh and Lake Erie, 6500 tons for the Michigan Central, 5000 tons for the C. C. C. and I. and 3000 tons for the Nickel Plate, a total of 40,000 tons. Three-quarters thereof, the Western business, went to Pittsburgh and Chicago mills, the former taking the bulk of it. We hear of additional transactions east of the Allegheny Mountains and South, aggregating between 30,000 and 40,000 tons, by two mills, one Western and one Eastern, at private terms. It is generally believed in the trade that the price named for a part of the Vanderbilt order by the new Pittsburgh mill was considerably lower than any given thus far. Whether or not the sale establishes the price at the low level reached must depend upon the eagerness of the newcomer for business and upon his ability to turn out product during the first six months of 1889. If a vigorous contest is made for business some demoralization is considered inevitable. On the other hand, work is coming up from unexpected quarters. Thus the receiver of a large South-western road is in the market for 50,000 tons of Rails, some of them for immediate delivery. Some of the large orders for other sections alluded to in former issues have not been placed, so far as is known. The market is somewhat irregular and our quotation of \$27.50 @ \$28 is continued, though particularly desirable orders could be placed at close to \$27, with the Western market relatively lower.

Financial.

The struggle over and the tumult of contending factions having subsided, the great disappointed minority will gracefully acquiesce in the decision of the popular voice. All alike will now contemplate the future with cheerful hopes, confident in the belief that a renewed career of prosperity awaits the country, in all its vast and varied interests. Recovery must quickly follow the period of partial paralysis, although the testimony from business sources is quite general that the interruption of the last few days has been much less serious than is usual during like periods of political agitation. Dun & Co.'s last circular says: "The single fact that bank exchanges outside of New York, in the last week of a Presidential campaign, exceeded those of last year by 10½%, the clearings of last year having been exceptionally large, proves that the volume of legitimate business is unprecedented, for only a part of the increase can be attributed to speculative operations." A review of the statistics of bank clearings for October and the last ten months, as given by *Bradstreet's*, possesses much interest. The aggregate clearings at 32 cities

during October—those for which totals are available for four years—show a gain of about 10 % over October, 1887; about 6 % over October, 1886, and nearly 11 % over the corresponding month in 1885. The bank clearings outside of New York City have increased relatively more rapidly than at the metropolis. Leaving New York's totals out of those first given above, it is seen that the aggregate clearings for October, 1888, at 31 cities were \$1,776,035,290, or 15 % more than in October, 1887, 17 % in excess of the aggregate for that month in 1886, and 35 % larger than in 1885. It will be recalled that early in the year the clearings declined notably as compared with the preceding 12 months, and to this must be attributed the decreases in the 10 months' totals as compared with 1887. The aggregate at 32 cities is 5 % less than in 1887; at New York it is 8 % less.

The Stock Exchange markets have been uninteresting in the absence of any pronounced movement to affect prices, bulls and bears alike seeming to acquiesce in a policy of inaction until the political atmosphere cleared a little. Respecting the future opinions diverge, depending much on the settlement of the surplus question as affected by the election and upon crop movements. Attention was almost entirely absorbed by Reading and New York and New England—these two and Union Pacific furnishing about one-half of the entire week's business. All three closed lower than at the end of the previous week. The situation among the Southern roads continues to attract attention, and there is a very general impression that the Richmond Terminal antics are but the beginning of a grand consolidation of Southern roads east of the Mississippi. The trunk lines were strong throughout. The decline in Reading was attributed to the possibility of lower prices for coal. It was authoritatively stated that there is no truth in the story from Baltimore to the effect that the Richmond Terminal company is negotiating for the acquisition or control of the Baltimore and Ohio. Union Pacific defaulted on the interest on Denver, South Park and Pacific bonds and the bond market generally was a little lower.

Government bonds were steady. Quotations as follows:

U. S. currency 6s.....	122

The weekly bank statement shows a decrease of \$1,968,150 in surplus reserve, which now stands \$18,730,595, against \$9,786,550 at the corresponding time last year and \$5,632,750 in the first week of November, 1886. The decrease in reserve is larger than had been generally anticipated. In the currency movement receipts and shipments were about equally balanced, but there were free shipments South. In loans there was an expansion of \$704,500. Specie showed an unexpected decrease of \$2,397,600, and legal tenders increased \$242,900. Deposits decreased \$746,200. The November interest and dividend disbursements are estimated at about \$25,000,000. The railroads alone pay out nearly \$22,000,000, of which \$15,000,000 will be for interest on bonds. Money on call, owing to the demand caused by the monthly settlements, advanced in some cases to 4½%. Time loans were offered in abundance at 3 to 3½% for three months or less, and at 4 % for four to six months where first-class collateral was offered. Commercial paper was in fair supply and the demand continued good. Quotations, 60 to 90 days, 4½% @ 5%; first-class four months' commission house names 5 % @ 5½%.

The posted rates for bankers' sterling are \$4.85 @ \$4.85½ for 60-day and \$4.88½ for sight. The market is strong. In Lon-

don money was easier. No further gold withdrawals from the Bank of England are announced as imminent. In consequence of uncertainty the directors have no choice but to maintain the present anomalous position.

Bond purchases by the Treasury Department during the week aggregated \$2,412,000. All were 4½s at 108½, and nearly all the offerings were at that figure. About \$3,000,000 4 % were offered during the week at prices ranging from 128 to 130, mainly at 128½, but none of them were accepted. Bond purchases up to date under the April circular aggregate \$92,159,850; and of this amount, in round numbers, \$51,750,000 were 4s and \$40,750,000 were 4½s.

The public debt statement shows that the reduction during the month of October was \$4,585,619.91. The total debt is now \$1,708,457,224.23, of which \$1,696,124,917.23 is principal and \$7,332,307 is interest. The decrease of debt since June 30, 1888, is \$28,294,620.57. The cash in the Treasury available for reduction of the debt is \$391,675,218. National bank depositories to-day hold \$54,480,279, or about \$3,000,000 less than on October 1. Government receipts during October were \$31,966,208, against \$31,803,172 in October, 1887. Receipts from all sources for the first four months of the fiscal year reach \$129,500,000, against \$134,131,569 for the first four months of the preceding fiscal year. The Treasury surplus is now about \$70,000,000, or \$40,000,000 below the highest point attained during the past year, and the money in circulation throughout the country is greater than at any previous time, partly as a consequence of the free silver coinage.

The wheat market has been much less excited, and spot stock is neglected. A curious feature was that on one or two entire days not a bushel was sold of spot stock. This has not happened before in many years. The demand for actual wheat is spoken of as no longer a factor, so that the absence of an export market has no appreciable influence. For the week there was a decline of 3½ @ 4¢ a bushel on near futures. Breadstuffs, on account of this peculiar situation, are slow and hesitating. Cash corn toward the end of the week declined to the lowest point reached in some months. The total decline for the week was ¼¢ @ 1¼¢ a bushel on the near futures. Export business became very good when the lowest quotations were reached. The latter market is firmly held. The provision market is slow. The pork-packing season ended November 1, and returns from all points in the West indicate a total of about 5,070,000 hogs, against 5,610,000 last year. Sugar is without interest. Spot cotton is steady at full previous quotations. The report that the Farmers' Alliance of Georgia and Alabama had ordered its members not to sell between November 1 and 20 did not appear to have any effect on prices. Teas are steady and moderately active. Wool has a strong look. Ocean freights are decidedly firm, with increased inquiry for room to load corn. Coffee was depressed by large stocks at shipping ports and heavy receipts. In dry goods the order trade for spring maintains all the encouraging features previously noted. Values are steadily maintained. The railroads are carrying the largest tonnage in their history. The New York City Comptroller awarded \$1,500,000 of additional water stock to the Farmers' Loan and Trust Company, Mayor Hewitt remarking that the bids showed that the city of New York enjoys the highest credit of any corporate body in the world.

The imports of merchandise at this port during the week were valued at \$8,668,000, of which \$1,733,000 represents dry goods. Since January 1 the total is \$395,409,000.

against \$398,662,000 for the same time last year and \$369,534,000 in 1886.

According to official figures of the United States Department of Agriculture, the winter wheat crop this year is about 275,000,000 bushels, and spring wheat 183,000,000 bushels, making a total of 458,000,000 measured bushels.

Boston dispatches announce that W. D. Forbes, president of the Bank of Redemption, in that city, had resigned from his position and had made an assignment, the cause being unfortunate speculation in Atchison. The bank, it was said, loses nothing.

Metal Market.

Copper.—During the week under review London has improved with spot Chili Bars from £78 to £78. 5/, and with futures from £78. 10/ to £79. Good merchantable brands have followed suit and come £78. 5/, as against £78 a week ago. Best Selected has advanced to £83, sales 600 tons. The visible supply in England and France, as reported per cable, was, on the 1st inst., 91,740 tons, against 89,404 on October 1 and 48,500 tons on November 1, 1887. It is reported from Europe that Chili Bars are being transferred gradually from England to France, because in the latter country more liberal advances are made on them in store than in England. Absolutely nothing transpired in the open market in Copper during the week; the quotation is nominally 17½¢ for Lake Ingot and 16¢ @ 16½¢ for casting brands.

Tin.—The November 1 statistics are 11,913 tons visible supply in Europe and America, against 11,451 on October 1, and 12,966 tons on November 1, 1887, being tolerably good, London has advanced with spot Straits from £102 to 102. 2/6, and futures, £102. 10/ to £102. 12/6, sales, 550 tons. Here a listless state of affairs prevailed, 10 tons spot selling on the Exchange at 22.65¢, but it is held at the close at 23¢, 22.75¢ being bid for November and 22.65¢ for December. The October Tin shipments to the United States from the Straits Settlements sum up 750 tons, against 100 last year, and to England, 2000, against 2500; since January 1 they have been respectively 2900, against 4100, and 15,700, against 12,700, as per cable from Gilfillan, Wood & Co., Singapore, to Chas. Nordhaus, 89 Water street, New York, their agent.

Tin Plates.—Our market has been very quiet and nominally unchanged, with the exception of Coke Tins, which are 5¢ per ton lower. There are a good many inquiries being put out for forward delivery, and, as makers' views are somewhat lower, no doubt business will result, now that the tariff question may be deemed settled. We quote at the close, large lines, ordinary brands, per box: Siemens-Martin Steel, Charcoal Finish, \$5 @ \$5.75; Coke Finish, \$4.70; Terns, \$4.20 @ \$4.35; Bessemer Cokes, \$4.40 @ \$4.45; and Wasters, \$4.25. Cokes are 13/3 @ 13/6 at Liverpool.

Lead.—The market has been comparatively quiet and featureless. Consumers have been picking up a little Lead in the open market to the extent of 500 tons at 3.70¢ @ 3.75¢, and on the Exchange 750 tons have changed hands at similar rates, the closing rate in the open market being 3.67½¢ @ 3.75¢, at which there is a steady feeling, sales of spot Lead having been made at 3.67½¢. The London market is £13. 12/6 Soft Spanish, and £13. 17/6 English Pig. At St. Louis there has been firmness at 3.60¢ @ 3.62½¢ Common, and 3.65¢, Corroding.

Spelter.—Remains in good position at 5½¢, Common Domestic, the lowest at which it can be had. Silesian is quoted £18. 17/6 in London, and here 6¢.

Antimony.—A fair demand has prevailed at 10½¢ @ 10½¢, Hallett, advanced to £63 in London, and 12½¢ @ 13¢, Cookson.

New York Metal Exchange.

The following sales are reported:

THURSDAY, November 1.	
200 tons Lead, cash.....	3.72½¢
228 tons Lead, November.....	3.82½¢
16 tons Lead, November.....	3.80¢
SATURDAY, November 3.	
16 tons Lead, December.....	3.67½¢
MONDAY, November 5.	
10 tons Tin, spot.....	22.65¢
WEDNESDAY, November 7.	
170 tons Lead, spot.....	3.67½¢
50 tons Lead (in transit).....	3.67½¢

Coal Market.

The Anthracite Coal market is very dull, with all descriptions in excess, Stove excepted, and no improvement is looked for while the present mild temperature continues. The first sign of weakness was in the Steam sizes, such as Broken, Steamboat and Pea, and with the closing of furnaces in Pennsylvania, on the line of the Reading particularly, the depression from this source became more noticeable. The sales agents in this city at their last meeting made no change. Bituminous Coal is in good demand and the scarcity of cars is still a subject of complaint. Prices are more or less affected by competition in supplying the market, so that while pool prices are recognized as a basis, and are sometimes insisted upon, sales of inferior grades are made as low as \$2.90. The interior demand can hardly be maintained beyond another fortnight in prospect of interrupted navigation. The statistics of Anthracite production for the last week are not at hand, but it is surmised that the aggregate is not more than 750,000, owing to shortened time in the Lackawanna region, as compared with 886,000 during the previous week.

Freights from New York eastward are quoted at 50¢ to New Haven, \$1.10 to Boston and \$1.15 to Portland, free of discharging. The average price of Coal in October at the Schuylkill collieries, drawn to determine wages, was \$2.61; last year it was \$2.62. The trade is grieved to hear of the serious illness of Fred. A. Potts. On Wednesday morning he was more comfortable. Pittsburgh is to have another outlet to Lake Erie by way of the Pittsburgh and Western Railroad to Butler, and from that point by an intermediate link connecting with the Nickel Plate road. The new line will be an important competitor of other Pittsburgh lines to the lakes in the Coal, Coke and Iron industries. The road will connect with the Lake Shore at Amasa.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from October 19 to November 1, inclusive, and from January 1 to November 1, inclusive, were as follows:
